The Independent

VOL. LXI NEW YORK, THURSDAY, JULY 5, 1906 No. 3005

Survey of the World

Adjournment of Congress

Congress adjourned at 10 p. m. on Saturday last, closing its session only two hours before the end of the fiscal year. On this last day nothing of importance remained to be done except the signing of the Public Buildings bill and an appropriation bill to pay for buildings the erection of which had been authorized in another measure. On Friday, the 29th, final action had been taken on the Railroad Rate, Meat Inspection and Pure Food bills. A deadlock in the case of the second of these had been ended when the Senate yielded to the House on the two points in controversy, permitting the cost of inspection to be paid by the Government and consenting that labels on canned meats should not bear the date of packing. Notice had been given that only by such concessions on the part of the Senate could the final passage of the bill be assured. Friday's session continued until midnight. The weary legislators expected to be released by 3 p. m. on Saturday, but blunders made by clerks or in the Printing Office kept them on duty until seven hours later. Engrossed copies of two bills were not ready for the President's signature, and in another bill, which he had signed, there was found an appropriation of $3,000,000 which Congress had stricken out. Recess followed recess during the long delay. At 12.35 a. m., the President, who had been detained with the legislators, started for Oyster Bay, having first given to the press the following statement:

"In the session that has just closed the Congress has done more substantial work for good than any Congress has done at any session since I became familiar with public affairs. The legislation has been along the lines of real constructive statesmanship of the most practical and efficient type, and bill after bill has been enacted into law which was of an importance so great that it is fair to say that the enactment of any one of them alone would have made the session memorable; such, for instance, as the Railroad Rate bill, the Meat Inspection measure, the Pure Food bill, the bill for free alcohol in the arts, the Consular Reform bill, Panama Canal legislation, the Joint Statehood bill and the Naturalization bill. I certainly have no disposition to blink what there is of evil in our social, industrial or political life of today, but it seems to me that the men of genuine patriotism who genuinely wish well to their country, have the right to feel a profound satisfaction in the entire course of this Congress. I would not be afraid to compare its record with that of any previous Congress in our history, not alone for the wisdom but for the disinterested high mindedness which has controlled its action. It is noteworthy that not a single measure which the closest scrutiny could warrant us in calling of doubtful propriety has been enacted; and, on the other hand, no influence of any kind has availed to prevent the enactment of the laws most vitally necessary to the nation at this time."

"In my judgment," said Speaker Cannon, "the work done and the legislation enacted in the session just closed exceed in importance for the best interests of all the people of the Republic the work of any session during my thirty years of public life."

Railroad Rates and Rebates

The Railroad Rate bill was signed by the President on the night of the 29th. For some days those parts of it which relate to pipe lines and passes had been subjects of controversy. After the second conference report, which exempted pipe lines from the provision forbidding common carriers to carry commodities produced or owned by themselves, Mr. Tillman declared that Standard Oil influence had been exerted suc-

cessfully, and that every Senator who voted for the change would have "S. O." branded on his forehead. But Mr. Long and Mr. Culberson undertook to show that the original provision would have driven many independent oil producers out of business, because it would have prevented them from using their own pipes from wells to railroads or from wells to independent refineries. The change made in the first conference was retained in the bill; that is to say, owners of pipe lines are made common carriers, but are not forbidden, as railroad companies are, to carry their own products. The paragraph concerning passes was rewritten several times. As finally adopted it forbids a company to give any interstate free transportation except to the following classes of persons:

"Its employees and their families, its officers, agents, surgeons, physicians, and attorneys at law; ministers of religion, traveling secretaries of railroad Young Men's Christian Associations, inmates of hospitals and charitable and eleemosynary institutions, and persons exclusively engaged in charitable and eleemosynary work; indigent, destitute, and homeless persons, and such persons when transported by charitable societies or hospitals, and the necessary agents employed in such transportation; inmates of the National Homes or State Homes for disabled Volunteer Soldiers, and of soldiers and sailors' homes, including those about to enter and those returning home after discharge, and boards of managers of such homes; necessary caretakers of live stock, poultry, and fruit; employees on sleeping cars, express cars, and linemen of telegraph and telephone companies; railway mail service employees, Post Office Inspectors, Customs Inspectors and Immigrant Inspectors; newsboys on trains, baggage agents, witnesses attending any legal investigation in which the common carrier is interested, persons injured in wrecks, and physicians and nurses attending such persons."

It was during a debate on passes that Mr. Tillman, complaining of the exemption of companies' attorneys, attacked the lawyers in Congress. "It is a pity," said he, "that we have so many meddling lawyers here." Whereupon his friend Bailey said: "It is a pity we have so many demagogues here who constantly criticise lawyers." He then defended the lawyers, and gave advice to Tillman, remarking that he had little patience with that philosophy which made ignorance the proof of virtue and poverty the evidence of honesty.——The Commission has been taking, at New Orleans, the testimony of oil producers and dealers concerning alleged discrimination in freight rates. One said that the rate on oil was 75 cents from Shreveport to Marshall, but only 15 cents from Marshall to Shreveport. It was asserted that rates were adjusted in the interest of the Standard Oil Company. In Washington, last week, before a referee in bankruptcy, Lawrence Nicolai testified that for ten years, up to 1905, the Standard paid him $3,000 a year to refrain from selling oil or gasolene in that city. He had been at the head of an independent company. When the payment was discontinued he was unable to resume business profitably.——The Government has decided to sue sixteen prominent railroad companies (among them the St. Paul, Atchison, Burlington, and Rock Island) for violation of the Safety Appliance law, which relates to the use of automatic couplers and power brakes.——Before Judge Holt, in New York, last week, arguments were made on the demurrers of the persons and companies recently indicted in the sugar rebate cases. One of the indictments (against prominent officers of the New York Central road and certain merchants of Detroit) alleges that these defendants are guilty of conspiracy, under the statute which provides imprisonment as a penalty. Counsel for the accused contended that the Elkins act showed that Congress did not intend that imprisonment should be a punishment for rebating. In reply it was said that Congress had knowledge of the existing conspiracy statute and therefore did not repeat it in the Elkins act.——Dispatches from Philadelphia say that counsel for certain coal companies, examining the Pennsylvania railroad's books by order of the court, have found such evidence of rebating or other discrimination that they expect to recover $1,500,000 for their clients.

Panama Canal Affairs

Before the adjournment of Congress, the Senate's bill providing that the canal should have locks, was passed in the House without debate. By a majority of one, the Senate committee refused to continue its investigation during the recess or to send a sub-committee to the Isthmus.

No action was taken by the Senate upon the pending nominations of Chairman Shonts, Governor Magoon, Mr. Bishop, and the other Commissioners. The appointments will be renewed.——By the municipalities in the Canal Zone twenty-three public schools have been established, under the direction of the Zone Government, and 1,128 pupils are attending. Five of the six municipalities have adopted compulsory education laws.—— It was expected that there would be much disorder at the election of members of the Panama Assembly. At the suggestion of Governor Magoon, however, leaders of the two parties met in conference and agreed to elect a mixed ticket in the province of Panama, assigning three candidates to each side. Two of those selected by the Liberals were Pablo Arosemena and Eusebio Morales, who were recently at Washington asking our Government to assist them in preventing fraud and intimidation at the polls.

Against Trust Combinations

Interesting action has recently been taken in several States against Trust combinations. We referred last week to the punishment, by imprisonment, of five prominent officers of as many ice companies, in Toledo. Each was sentenced to pay a fine of $5,000 and go to jail for one year. Two have since offered to reduce the price of ice by 30 per cent., but Judge Kincaid insists upon restitution to consumers who have been compelled to pay the combination price. He has, however, reduced each fine to $2,500, and the jail term to six months. Counsel for the sentenced men addressed to this judge himself a motion for a suspension and vacation of the sentences upon the ground of his own misconduct, alleging prejudice, subjection to improper influences, and the breaking of a promise to the accused. This was stricken from the files as false, scurrilous and insulting. Another court, however, has entertained the motion, and there is to be a hearing. Meanwhile, two of the men are out on bail.——In Philadelphia, thirteen ice dealers have been arrested and will be prosecuted under the common law for criminal conspiracy. It appears that they really represent only two companies, which, having obtained control of 90 per cent. of the supply, have doubled the wholesale price since March last. Prices were fixed by a committee, and the District Attorney has a copy of the minutes of this committee's meetings. The newspapers assisted him in getting evidence. Across the river, in Camden, N. J., the local prosecutor has asked the ice dealers to explain their methods, intimating that he may ask for indictments. In St. Louis, under instructions from Governor Folk, the prosecuting attorney is making an investigation concerning an ice combination which has nearly doubled the price.——Judge Ryan, of the Circuit Court, in St. Louis, ruled last week that the Cahill-Swift Manufacturing Company, because it was a member of a Trust combination, was not entitled to the aid of the courts in the collection of debts. The company was suing one Walsh, a plumber, for $240, owed by him for material, which, as he admitted, he had received. He asserted that the company was a member of a combination that was driving out of business all plumbers who were not in an Association. Having sold supplies to him for three years, it informed him, he said, that it would sell to him no more, because of the agreement. He then owed the company $240. In court his defence was the provision of the Missouri Trust law, that the courts shall not be used by violators of this law in the collection of debts for commodities sold.——Conferences have been held at Washington with respect to the approaching prosecution of the Standard Oil Company for violation of the Sherman act, the Elkins act, and the conspiracy statutes. Among those attending were the special counsel and the District Attorneys of Buffalo, Cleveland, and St. Louis. A special session of the Federal Grand Jury, at Cleveland, is to be held this week. It was announced in Washington, on the 29th, however, that the Government would not be ready to take any of the cases into court until about six months hence.

College Boat Races

At the annual contest between Yale and Harvard on the Thames, at New London, on the 28th ult., Harvard won the

race for university eights for the first time in seven years, but in the races for university fours and freshman eights Yale was the winner. The two crews of freshmen were quite evenly matched, and the result of their race was in doubt almost to the end, Yale leading then by only a half a length. In sharp contrast with this, the race for fours was a mere procession, Yale finishing more than eight lengths in advance. The third and greatest race of the day was seen by 40,000 people. From the start to the last half mile the two crews were almost abreast, but in the last half Harvard forged ahead and crossed the line with a lead of about two lengths (9 seconds of time), while two of the Yale oarsmen were disabled by exhaustion.——At the races on the Hudson, on the 23d ult., Cornell won the four mile pull for university eights and also the race for fours. In the first of these, Syracuse led for nearly a mile, but fell back when Cornell took first place, and finished third, only four feet behind Pennsylvania. Wisconsin, Columbia and Georgetown followed at some distance in a group by themselves. The race for fours was taken easily by Cornell, whose boat crossed the line five lengths in advance of the Syracuse crew. An interesting contest was seen in the freshman race. Syracuse took the lead, and won by a length, with Cornell second and only six feet ahead of Wisconsin, which had made a good fight for second place.

The Philippine Islands

Quientin and Adva, leaders of the Pulajanes in the Island of Cebu, have surrendered to Governor Osmena and the Constabulary. These are said to have been the last of the men arrayed against the Americans in that island. Some years ago they took the oath of allegiance, and were employed by the army as guides until it appeared that they could not be trusted. Then they violated their oaths and joined the insurrectionists.——In February last, Archbishop Harty, of Manila, sent to Governor Ide a letter concerning the proposed submission to the courts of the controversy over the San Juan de Dios hospital and lands. This letter was published in the United States. It contained the following paragraph, which the Governor regarded as offensive:

"Before going to court as a peaceful American citizen, I shall have read simultaneously in 250 pulpits a solemn protest against this attempted confiscation. This protest will go thru the archipelago and will reach the White House. It will surely be taken up by the American people. This step has not yet been taken, and time still remains to recall your order."

Owing to the publication of the letter, Governor Ide has given out his reply. The matter rested, he said, upon two opinions of the Attorney General, and no action had yet been taken. He continued:

"A portion of your letter produced a painful impression on me. It was what seemed to contain a threat that the course you will take thru the Philippines will excite hostility against the Government. I agree that if your action should go thru the archipelago it would reach the doors of the White House, but I am certain that the result would be far other than the one you had in mind."

Manila newspapers comment upon this from various points of view. It is understood that Governor Ide's attitude is approved by the President.

Cuba

President Palma sent to Congress, last week, a message pointing out that the nation was in duty bound to improve the condition of Havana by making sewers and paving the streets. He directed attention to the sewer contract made with McGivney & Rokeby by the intervening Government, involving a payment of $10,849,000, saying that some changes of the specifications were required. These, he thought, could be made without difficulty; if not, the contract might be annulled by mutual consent. As the city could not readily supply the money needed, the national Government, he said, must take up the work. He recommended an annual appropriation of $2,500,000 for three years, with an understanding that the city should add something. On the 30th, Congress adjourned until November, without taking action on this subject. It authorized the President to expend $1,000,000 in encouraging immigration, 80 per cent. of the money to be used in procuring immigrants from Europe and the Canary Islands. It also granted a subsidy of $6,000 per kilometer for railroads that

are to be branches and feeders of the Van Horne railway system; but the expenditures are not to exceed $500,000 in one year.——No action was taken by the Senate at Washington before final adjournment on the pending treaty concerning the Isle of Pines, or upon Mr. Morgan's resolution authorizing a committee to visit the island and make an investigation. On the day before adjournment, Senator Dick introduced a resolution declaring that the island rightfully belongs to the United States, and providing for it a temporary government like that which exists in the Canal Zone. Senator Morgan opposed a reference of the resolution to the Committee on Foreign Relations, asserting that no question touching a foreign nation was involved. Upon his motion it was referred to the Committee on Pacific Islands and Porto Rico.

The French Army

The asserted new evidence, showing that documents were forged, which led to the condemnation of Major Dreyfus, is the claim which Major André makes for a revision of the sentence against him. It also gives occasion to a curious revelation by General André, who was formerly Minister of War. It was his desire, and that of the Cabinet, to put an end to the tyranny of the military bureaucracy which had for so many years governed the army over the heads of the successive Ministers of War. General André relates dramatically the difficulties put in his way by the Chief of the General Staff when he began what he and M. Waldeck-Rousseau regarded as a necessary task. His first measure—namely, the removal of three lieutenant-colonels—was submitted to the Chief of the General Staff, General Delanne. On the morrow the latter tendered his resignation. General André refused to allow him to retire until he himself was disposed to let him do so. Meanwhile the officers appointed to the General Staff began to arrive at the War Office. General Delanne posted up an order in the War Office declaring that the old officials continued to be responsible for the service in the departments for which General André had chosen new titularies. General Delanne's attitude revealed to General André the existence of a formidable authority the rival, if not the superior, of the Minister, and proved to him, as to M. Waldeck-Rousseau, that it was high time to intervene and to wrest the army from this collective and irresponsible dictatorship. One day, while at work in his Cabinet, General André received a visit from Count Muravieff, the Russian Military Attaché, who was well known to be on terms of *camaraderie* with many members of the War Office Staff. General André, who looked upon him as a "jovial comrade," was surprised to find that his face wore an unusual expression of seriousness. After a formal military salute the Count suddenly said in a severe tone, "Monsieur le Ministre, I have come to see you about the General Staff officers whom you want to remove. I should be glad if you would revoke your decision." General André refrained from any outburst of temper and said, "*Mais non,* that is my decision, and I hold to it, first, because I think it a good one; secondly, because I have taken it." Colonel Muravieff observed haughtily, "It is as a representative of the allied Powers that I ask you to cancel your decision." The Minister was indignant. "I have to receive orders," he said, "only from the French Parliament, and I beg you . . . ." He was interrupted by the Military Attaché, who exclaimed in a loud tone, "In these circumstances, Monsieur le Ministre, I am bound to tell you that you have not kept to the alliance." General André, in reply to Colonel Muravieff, said, "This conversation can be continued only thru the medium of the Minister for Foreign Affairs. Be good enough to go." General André then rang for his carriage and drove to see M. Waldeck-Rousseau. The latter said that this was another *coup* on the part of the General Staff, who had employed the Russian Attaché in order to make General André capitulate. M. Waldeck-Rousseau approved General André's words, assured him that there was nothing of the kind in the treaty of alliance, that Frenchmen were *maitres chez eux,* and requested him to report the matter to M. Delcassé. He, therefore, went to the Quai d'Orsay, and while

waiting to see his colleague had time to write out textually the scene with Colonel Muravieff. M. Delcassé reassured General André as to the text of the treaty, but appeared annoyed by the incident. He did what was necessary, and sortly afterwards Colonel Muravieff was recalled. Such were the means, says General André, adopted by the Clerical coterie of the General Staff to thwart the ends of a Minister who merely sought to govern in the name of the Republic.

France and Baden

As is well known the bishops of France by a majority of 22 voted in favor of the "Associations Cultuelles." Cardinal Richard's secretary brought the result to Rome, which referred the matter to a commission of six cardinals, of whom but one is a Frenchman, Mathieu. Two of the others, Rampolla and Vincenzo Vannutelli, are friendly and advanced. The two Spaniards, Del Val, President, and Vives y Tuto, as well as the Jesuit, Steinhuber, may be regarded as opposed, as they are *réactionaires* of the most pronounced type. The certainty that all the churches in France belonging to the State will have to be given up in case the "Associations Cultuelles" are rejected may have an effect on the opposition, who may endorse the bishops' action. After all, it looks like Hobson's choice. ——As in Belgium at the recent elections the clergy took an active part in order to secure the control of the Parliament, so more recently they have done the same in the Grand Duchy of Baden. In the German Duchy it is the more serious, as a law exists forbidding such interference. In Belgium, the Clericals won out, but with a reduced majority. Hence the Government took no notice of the complaints made by the Liberals and Socialists. In Baden the Government itself denounced the priests to their bishops, who, however, tried to escape by a general statement that the parish priests were not expected in any way, either in the pulpit or out of it, to favor the interests of the Center party (*i. e.*, the Catholic party of Germany). But the Government, dissatisfied with this reply, brought home to the episcopate proof of interference. The bishops then consented to listen, and seem ready to examine into the cases so charged.

The Russian Situation

There has, as yet, been no submission on the part either of the Czar or the Duma. The Duma still insists on the resignation of the Cabinet and the appointment of a new Cabinet that shall be responsible to the Duma; but there is no sign that the reactionary cabal will yield, altho Premier Goremykin is reported as despondent and wishing to retire; but Trepoff, the strong representative of tyranny, seems still to hold the confidence of the Czar, as he did when Count Witte made the condition that Trepoff be removed, or he would resign, which he did. Count Witte has sent from Paris several urgent telegrams, emphazing the necessity of putting a stop to the anti-Jewish outbreaks, the impression of which on the outside world has seriously affected Russia's credit. Doubtless Trepoff would succeed in having the Duma dissolved and its members sent home, but the result would be the utter collapse of Russian credit on the European bourses, where the Jewish bankers are much disaffected by the butcheries of Jews at Bielostok, and the evident neglect of the authorities to protect them. Indeed, in an address in the Duma a leading member intimated very clearly that Trepoff was responsible for the massacre. The Commission which was appointed by the Duma to inquire into the Bielostok massacre has made its report. It charges the police with enrolling roughs under the guise of firemen and employing them to beat Jews. Jews were taken to the police station, where some of them were actually killed by the maltreatment they received. This was done, the Commission declares, with the knowledge and sometimes in the presence of Chief of Police Kodarefsky. The Commission accuses army officers of encouraging the mob to pillage and massacre. It points out that wherever the military did their duty the rioting ceased immediately. The report that the Goremykin Cabinet will resign is general, but not yet confirmed. Emperor Nicholas apparently is encountering trouble in finding a man to whom to intrust the reins of power and effecting an understanding with the liberal

groups of Parliament. The Constitutional Democrats would have the lead, as they are yet apparently loyal to the throne, and the other more radical groups might accept their lead, but with sharp watching. The Constitutional Democratic Parliamentary Committee met on Sunday behind closed doors to discuss tactics under the new situation. The committee adhered to its former decision that nothing less than a fully responsible Cabinet will be acceptable and that Constitutional Democrats will refuse to take portfolios in any mixed Ministry. The ignorance of the official press is illustrated by an editorial in the *Novoe Vremya,* discussing the resolution adopted by the American Congress relative to the Bielostok massacre, which calls attention to the American treatment of Hebrews, affirming that they are excluded from the service of the State and that they are as rare as Chinese in the universities. The article further alleges that the United States immigration restrictions based on diseases of the eye and scalp are designed with the intention to bar Hebrews from America. Everybody here knows that the colleges in our large cities are full of Hebrews.

Disaffection in Russian Army

The most serious condition in Russian affairs now concerns the growing disaffection in the army, and even among the Cossacks and the pampered Life Guards, who are the special protectors of the Czar. One battalion recently adopted resolutions endorsing the program of the Duma; but it was punished by degrading it to the ordinary rank of an infantry battalion of the line, losing all the privileges belonging to a regiment of the Guards. This battalion belonged to the famous Preobrejensky Regiment, whose uniform the Czar wears. He was so moved by its disaffection that he declared he would never wear its uniform again. It is declared that all three battalions of the Preobrejensky Regiment joined in the resolutions of solidarity with Parliament and its agrarian program, but when they were surrounded by grenadiers, lancers, sharpshooters and a brigade of artillery two of the battalions weakened. The other, however, faced the music and was disarmed. The propaganda of either socialism or sedition is vigorously pushed in the army, and every method is taken to counteract it. Two musicians of the Guards, of the finest military band in Russia, were charged with inciting this political movement, and were seized and imprisoned. In a multitude of cases the troops refuse to obey orders. At Tamboff a regiment was brought into the town to fire on a crowd and instead they fired on the police. The troops at Vladikavkez fired into a hall where the officers were holding a dance. The authorities recently sent an infantry regiment against the Tenth Cossacks, who were in a state of mutiny at Orenburg. The two regiments got together and agreed not to use arms against each other. The Cossack regiment at Eysk has asked the Minister of War to disband the men belonging to the third class, because they are required in the villages, where agricultural operations cannot be carried on owing to the lack of farm labor. In Southern Russia there seems to be real danger of disintegration, and there is talk of setting up republics. The troops of the Odessa garrison have adopted a petition to the Duma asking it to send a delegation of its members to examine on the spot the grievances of all branches of the service. The petition is addressed to the Labor party of the Duma and declares adhesion to its democratic demands. Troops from Kars and Tiflis have been sent to Batum, where the mutiny continues. At the other extreme of the Empire, in Poland, the revolutionary agitation is paralyzing the administrative machinery; and at Warsaw it is said that the police are fleeing by wholesale across the Austrian border from fear of assassination by the Terrorists, while the revolutionists have succeeded in persuading the soldiers not to do police duty. In the Volga provinces two regiments quartered at Samara marched from their encampment, with bands playing, into the public square, where they held a meeting and drafted a list of grievances. The commander was compelled to grant some concessions. There is a multitude of such cases of rebellion or disaffection in the army too numerous to mention, while ominous reports come from the navy. It

was reported that the Czar was so frightened that he would leave the Peterhof Palace for Tsarskoeselo, but that is denied. Indeed, he is much safer where he is, as his yacht is close by, where in a few moments he could escape to Finland or Denmark or Germany.

Chinese Labor in South Africa

The British Cabinet has been much attacked because it has not sent back the Chinese laborers who were brought to the Rand. The introduction of virtual slavery into South Africa was one of the chief charges brought by the Liberals against the Balfour Government in the late election. But the Government has done nothing more than to provide that no Chinese should be kept against their will; and it is not easy to see how, after the contracts entered into by the laborers, anything more could be done. The only reason why the mine-owners wished to introduce coolies was because they could not get either white or negro labor at the prices they were willing to pay. It was not their desire to introduce white labor, British or Italian, partly because they would have to pay a larger wage, and in good part because they wanted to get subservient labor, that would not form labor unions nor settle and vote. They insisted that their industry could not be carried on by white men; that white men would not work, on account of social and racial prejudices, while the cost of white labor would be prohibitive. To be sure, white labor under similar or worse conditions, is used in Australia and America. They simply said it was impossible to get white labor, and that ended it, and the Balfour Government yielded. It is now seen that this was an error. Mine-owners are now giving work to white men at $1.88 per day, and this is found to be as profitable as Kaffir or Chinese labor. We do not understand that many Chinese have chosen to return, but no more will be introduced under the present conditions.

Various Matters

The Moroccan crisis has cost France $50,000,000 for extra military preparations in fear of a war with Germany, and this will have to be met with a loan. The Finance Minister reports a further deficit of $30,000,000 owing to the increased cost of internal reforms, and this will be met by heavier taxation.——The severe punishment inflicted on the Egyptian fellahin who attacked a company of five British officers and killed two of them has attracted considerable attention. Several of them were hanged, and others were publicly whipped in the presence of the people of the village and the neighborhood. This hardly proves any general disaffection, altho there have been signs of Pan-Islamic feeling against Great Britain ever since the dispute with Turkey over the Sinaitic boundary. Especially has this shown itself in the El-Azhar students at Cairo, where one student in that Moslem university from India was subjected to such ill treatment for his British sympathies that he was compelled to leave the university.——The British Parliament has by an overwhelming vote and the use of the closure passed the most bitterly debated of all the clauses in the Education bill, that which allows religious teaching in the schools when three-fourths of the parents request it. This is a concession to those districts inhabited almost wholly by Catholics. There was much Liberal criticism of this section. Four sections of this bill have now been acted upon.——The first message over the completed American Commercial Cable Company between San Francisco and Japan was sent by President Roosevelt to the Emperor of Japan. It celebrated the completion of the last portion of it, that from Guam to Japan. The Emperor Mutsuhito returned a message of good will.——There was a terrible accident last Sunday night on the swift American Line special train from Plymouth to London. The train was trying to make record speed, and was going at the rate of seventy miles an hour when the light English engine with the three passenger cars and baggage van left the track on a curve, and the engine and cars were demolished and twenty-three passengers from America and four trainmen were killed and others wounded. Mayor McClellan, of this city, was a passenger, and anxiety was felt for his safety until a dispatch from him was received showing that he waited for a later train.

The American Proposition for Peace

BY RICHARD BARTHOLDT

MEMBER OF CONGRESS FROM MISSOURI AND EX-PRESIDENT OF THE INTERPARLIAMENTARY UNION.

BEFORE I speak of the Interparliamentary Union and its American Group in connection with the Brussels Conference, I wish briefly to refer to some arguments recently advanced by a very high authority in justification of war. We say, if it is right, if it is good ethics and good law that courts should settle controversies between individuals, then it must also be right, good ethics and good law for courts to settle controversies between nations, for what is law for an individual should be law for a nation. If not, why not? The answer of the authority referred to is that there is no analogy between international and national law. A private citizen, he says, can have his rights defended by the power of the State—that is, by the sheriff's posse, the militia, and, if need be, by the army; but there is no such power behind international law to enforce judicial decisions. Let us see. In the first place, it is plain that if there is no analogy between the two kinds of law, there surely ought to be, and to supply the deficiency—that is, to make them analogous, is exactly what we are striving for. And surely, a compact between the nations to secure their peace would include a provision for the enforcement of judicial decrees. But we need not go that far. Since the year 1815 more than 200 international disputes—to be exact, 240—have been settled by arbitration, and in each one of these cases the contending nations have accepted the verdict without protest, and in no case has the losing nation attempted to evade or resist it by force. Thus, if the history of arbitration teaches anything, it is this, that the combined moral force of public opinion and of the compact between the nations is effective in the enforcement of judicial decisions; perhaps more effective than armed forces would be; it seems, therefore, that no further proof is necessary to demonstrate that physical force is unnecessary in administering international law, provided a proper system for declaring that law is created, and for adjudicating alleged violations of the law. But, says the same authority, when there is a conflict between peace and righteousness, then a self-respecting nation must uphold righteousness even if the path leads to war. Who, we ask, is to be the judge of what is righteous? Is an interested and consequently partial government, or is a nation whose passion has been inflamed by some unfortunate incident and whose judgment is consequently blinded, a better and a safer arbiter than an impartial tribunal which deliberately weighs a cause in the impartial scales of justice and right? To ask the question is to answer it.

Now, let me proceed from the abstract to the concrete. What are our plans and what has been done toward their realization? As the elected representatives of a nation whose traditions are to set the world an example in the love of liberty and peace, and in the ways of justice and fair dealing, and charged with the duty of making due preparation to preserve our rights, by force if necessary, but also with the duty of striving in every possible way to find a better and surer means, seventeen of the 200 members of the American Group of the Interparliamentary Union repaired to the Brussels session of that great body, determined to make a stand for progress toward peace along practical lines. The moment seemed propitious, and it is easy to show how, for a long time, the world has been steadily moving toward the point at which this would be in order.

In 1887 a delegation from the British Parliament appeared at Washington with a memorial signed by 234 members of that Parliament, requesting the United States to take the initiative for general treaties of arbitration between all well disposed nations. No such *move* was ever before made in history. The outcome was an organization known as the Interparliamentary Union, composed ex-

clusively of national lawmakers. It began very modestly, but has grown very rapidly in numbers and in influence, containing now over 2,000 members. It has done much to arouse public opinion in favor of arbitration. It has exercised great influence upon the action of governments. It inspired the Czar to call the first and President Roosevelt to call the second Hague Conference.

In its resolution calling for a second Hague Conference it suggested that this conference ought to consider, among other things, the granting of jurisdiction to the Hague Court, thru treaties of arbitration and the establishment of a Permanent International Congress.

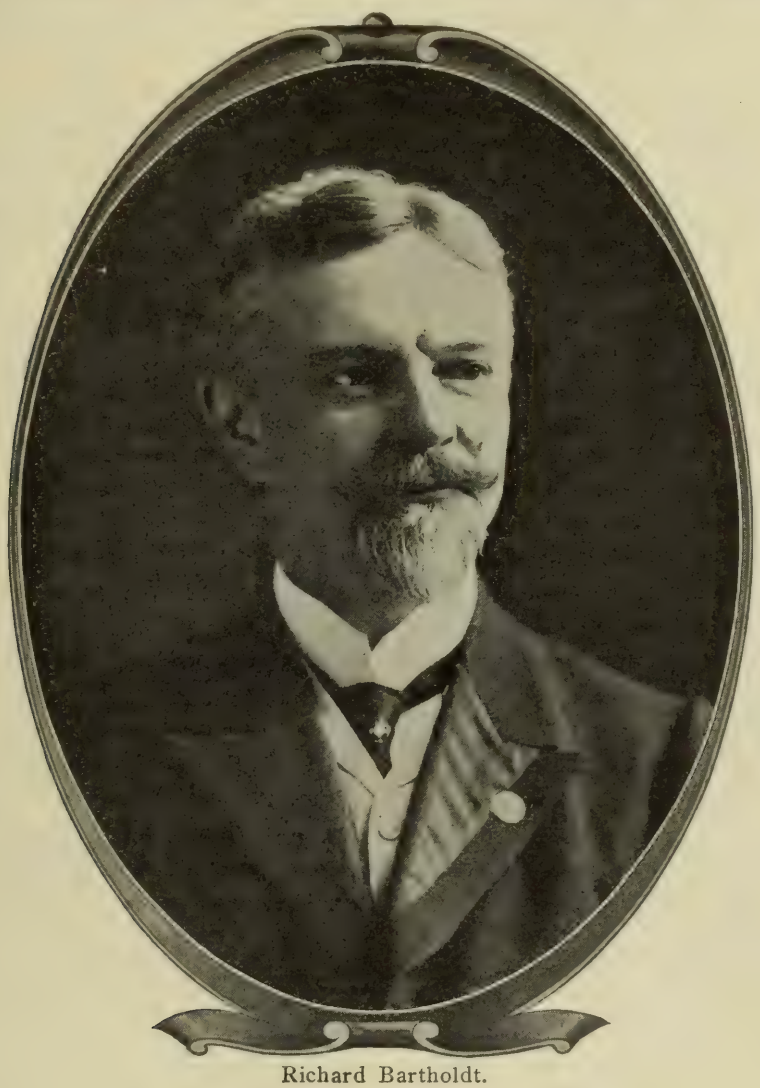
The Russo-Japanese war necessitated the postponement of the Conference until peace could be re-established. But this was not without some good results, for the horrors of that war prepared public opinion in all nations for favorable action on this practical plan to prevent the recurrence of such calamities.

On March 6th, 1905, the American Group of the Union authorized me to propose that South American nations be particularly invited to attend its Brussels session, and that the program provide for discussion of the following questions: A treaty of arbitration fit for general acceptance and the best basis for a Permanent International Congress. I laid these matters before the meeting of the Executive Council of the Union last summer, and they were all three acceded to. The Council requested me to present to the Conference in full session a basis for an International Congress, and it named a committee, of which I was a member, to prepare a draft of a model arbitration treaty.

On my way to Brussels, thru the courtesy of THE INDEPENDENT, I was able to make public the few fundamental propositions on which it seemed to me an International Congress would have to repose. I arranged for copies of THE INDEPENDENT with this basis outlined in its columns to be sent to each member of Congress who had agreed to attend the Brussels Conference, in order to allow for the largest possible thought on the subject by the American delegates prior to the convening of the Conference. It was impossible, however, after the action of the Executive Council, to do more than formulate a draft of an arbitration treaty, and have it ready upon our arrival at Brussels.

Naturally, there was not entire agreement among all the American delegates on these two grave questions, the details of which could be made known only on the eve of the Conference. But party and personal considerations were all sunk in the desire to promote the progress of peace and justice, and the Americans all stood together for the essentials of the propositions formulated during the summer. Several members of the delegation made able and convincing addresses on various phases of the question.

The Executive Council entrusted to Count Albert Apponyi, of Hungary, the drafting of a reply to our propositions. He is a very great statesman, and as a member of the new Hungarian Cabinet, is called upon to solve the problems which have vexed his country for centuries.



In an address as simple as it was powerful, Count Apponyi declared that the grand idea embodied in the American proposition would knock at Europe's doors till it was admitted. And upon his motion, it was unanimously decided to refer each branch of our proposition to a commission.

Two commissions were appointed, and have since been wrestling with these problems. They will report at a conference of the Interparliamentary Union which has just been called to meet at London on July 23d. The Commission on International Parliament has already reported in favor of transforming the second Hague Conference into a permanent body, to assemble automatically and periodically, and to reorganize the Interparliamentary Union so that it can cooperate with the Permanent International Congress at The Hague, in shaping a suitable system of international law, duly administered.

Briefly stated, this is what the American delegation has accomplished by its attendance at the Brussels session of the Union.

The question naturally arises how this great international reform is to be brought about. In view of the early

assembling of the second Hague Conference, it appears to be merely a question of inducing this body to proceed to the consideration of the plan. Its feasibility will surely be admitted by the delegates of the several countries as readily as the supreme necessity of the early compilation, and sanction by the nations, of what now passes under the name of international law. It would seem that the advocacy and presentation of the plan by so influential an organization as the Interparliamentary Union should of itself be sufficient to insure its respectful and favorable consideration by the Conference. But, in addition to this, the members of the Union will no doubt use their influence with their respective governments in favor of the proposition. To leave nothing to chance, however, I have introduced a joint resolution authorizing and requesting the President to instruct the American delegates to the Hague Conference to favor this plan, and to do all that lies in their power toward securing its adoption. What favorable action by the Conference would mean to civilization and to the cause of humanity and international justice is apparent to all. In addition to an international judiciary, now afforded by the high court at The Hague, the world would be assured of the benefit of an international legislature, charged with the duty, first, of supplying the law which is to govern the judiciary in the adjudication of cases to be brought before it, and secondly, of agreeing on a system of arbitration by which the possibilities of war will be reduced to a minimum. A reduction of armaments will follow without further agitation and as naturally as ripe fruit falls from the tree. And this will be only one of the beneficial consequences of the proposed international organization. A permanent Hague Conference, with the power to meet periodically and when it pleases once assured, there will be no

Richard Bartholdt.

more need of the friends of peace and arbitration to prevail upon Czars or Presidents to call such a body into being.

It goes without saying that the change here proposed will require the sanction of all governments to give it force and effect, even after the second Hague Conference has pronounced in its favor; but no one need feel any concern on that score. If the people are given a chance to pass judgment upon this reform—the greatest, most far-reaching and most beneficial political reform ever undertaken—they are sure to rise to the full hight of their golden opportunity, and the moment they grasp the new dispensation in its full comprehensiveness, their majestic power will force all other "majesties," great and small, to capitulate unconditionally.

Supposing that the second Hague Conference is transformed into a permanent body, whose members will all the while be devoting themselves to finding a solution for the most pressing international problems, and who will assemble periodically to declare in favor of such ideas as meet with the approval of their body in conference, still there will be much work to do, which can best be done by the Interparliamentary Union *in co-operation* with the various progressive organizations in the several nations. In my opinion, the time has come for the organization of a sort of International Civic Federation, with offices at the principal political centers of the world, and containing representatives from the Interparliamentary Union, from the press, from the business organizations, such as chambers of commerce, from the organizations such as the Civic Federation, the labor organizations, the societies especially organized to promote peace, the patriotic societies which have sprung up in the wake of the wars that have ravaged various nations, from the vague department of our life called the general public, and from that class which is called either capitalists or plutocrats, depending upon whether you want them to aid you in your plans or to thwart them in theirs. The really good men of this class have now a rare opportunity to make an investment which will produce immediate and quick returns. The masses of the people need to be informed of what has been done and what is proposed. To do this the press must be enlisted in the movement as the artillery department, and loaded with the most accurate and convincing array of facts.

The current of events and the movement of persons could be seized upon to make timely publication. Delegations could be sent from various parliaments at opportune moments to organize groups of the Interparliamentary Union in parliaments where none now exist, or to strengthen those that are already formed. Outside aid is needed for this, because of the short term and the small pay which the people's representatives enjoy and the great distances involved.

Members of the United States Congress find difficulty in attending the sessions of the Interparliamentary Union, because they occur usually in Europe.

With an ample fund for prosecuting this campaign and an organization capable of conducting it, the Interparliamentary Group in the various Parliaments could be counted on to supply a delegation of competent men to do the actual work of organizing and strengthening the arbitration groups in the various Parliaments, thru exchange of visits, until the Union is brought up to the point of having a majority, in numbers and in influence, in every National Parliament, and solidly organized on the platform of jurisdiction for the Hague court and an International Congress, duly constituted, to supplement it.

This work is waiting to be done; the time to undertake it is at hand; America seems to be the place for its practical initiation, and New York the best point for establishing the American office of such an International Civic Federation.

Baron d'Estournelles, the French member of our Commission, has been building the foundations for such an organization. He has committees already organized in twenty-one nations. These committees need only to be completed by proper addition to the membership and by provision of the necessary funds and an executive committee to spend it, in order to wisely make the wheels of progress carry the world along these practical lines, at express speed, instead of at the slow rate of former centuries.

WASHINGTON, D. C.

An International Executive Power

BY JOHN BASSETT MOORE, LL.D.

[This article from Professor Moore, of Columbia University, is of great significance, approving as it does the immediate establishment of an international legislative body, and even looking toward the ultimate development of an international executive power. One need not be reminded that Professor Moore is recognized thruout the world as one of its leading authorities of international law and politics. He has published a monumental work containing a complete account of every question submitted to international arbitration during the past century. He served the Government during the Spanish War as Assistant Secretary of State, and took part in the conclusion of peace with Spain.—EDITOR.]

IT has, as I understand it, been proposed by Mr. Bartholdt and his American associates in the Interparliamentary Union that the next Hague Conference shall be converted into a permanent body. This proposal is exceedingly interesting, and is far-reaching in its ultimate possibilities. Its distinctive significance lies in its suggestion of a permanent international parliamentary body. The great achievement of the first Hague Conference was the establishment of a permanent tribunal for the exercise of judicial functions. Special tribunals had, as we all know, often been created before for the decision of particular questions; but a great step was taken in advance when for occasional tribunals there was substituted a permanent organization, always open for the exercise of judicial functions between nations. It is now proposed that another great step shall be taken by the constitution of a body which, even tho it be not invested with direct legislative power, shall always be open for the consideration and discussion of matters of international concern with a view to conclusions which shall be in their nature legislative. If we were to review the history of the past hundred years we should find that the formulation and adoption of international rules by means of international conferences has been one of its most remarkable achievements. The measures thus adopted have been in a real sense measures of international legislation, so that we have witnessed the exercise among nations, for international ends, not only of judicial power, but also of legislative power. If the next Hague Conference should result in the creation of a parliamentary body for the consideration of measures in their nature legislative, we should then secure, in place of the occasional exercise of international legislative power, the same element of permanency in the domain of international legislation as has already been attained in the domain of international judicial action—not indeed that direct and immediate action which is assured within the State by judicial and legislative processes, but the permanent possibility of and invitation to action.

With the permanent possibility, thru permanent organs, of judicial and legislative action established, it would yet remain to constitute a common executive power by which the enforcement of international judicial and legislative acts should be assured without producing a state of war. The advocates of peace too often seem to assume that the use of force can suddenly be done away with by plans of conciliation and arbitration. This assumption altogether neglects the existence in the world of evils that have to be repressed with the strong hand. No one proposes to do away with the police forces in our municipalities, for the reason that every one recognizes the fact that there are evil elements in the community that have to be repressed. The same tendencies and propensities to evil we find among nations, varying according to their development, political, moral and social. The great problem confronting those who wish to do away with war is how to employ the force necessary to the restraint or repression of evil without producing the legal condition of things called a state of war. The most striking imperfection in the international system today is the lack of a common agency for the enforcement of law. If, at the present time, a contest by force breaks out between two nations, the con-

flict is recognized as a war, and other nations assume the attitude of neutrals, even tho the cause of the conflict be the flagrant disregard by one of the contending nations of a well-settled principle of international law. Such a condition of things involves an obvious incongruity, the remedy for which would be the organization of a common agency for the enforcement of law; the addition, in other words, to judicial and legislative power of what we call executive power. This is a problem of the future, probably of the far-distant future; but it is an ideal and a goal toward which it is permissible to labor.

New York City.

Present Prospects for Peace

BY HAYNE DAVIS

Secretary of the American Delegation to the Thirteenth Interparliamentary Conference.

AN extraordinary session of the Interparliamentary Union will convene at London, July 23d, to consider the American plan looking toward permanent peace. During the same week the third Pan-American Congress will convene at Rio de Janeiro, and preparations are being made for the second Conference of Nations at The Hague.

It is appropriate, therefore, for the advocates of peace to take a look over the field, in order to estimate justly the strength of their forces, as well as the excellence of their plan of campaign. It is, indeed, encouraging to note the names and character of the men who are now in charge of the standing army, that is ready to wage this war for peace, along lines which are bound to end in victory.

Great significance must be attached to the fact that it is Prof. John B. Moore, who has stamped with approval, in the previous article, the proposition to create an International Legislative Body; and, not satisfied to stand on this progressive plank, has advocated the earliest possible development of an International Police Power.

The nations have submitted nearly one hundred and fifty questions to the judgment of courts of arbitration during the past one hundred years. The reports of all these cases are contained in a voluminous book, of twenty great volumes, by Professor Moore, who was compelled to steal time from his arduous duties as Assistant Secretary of State and Professor of International Law at Columbia University to prepare and publish this work.

No man in the world is better informed about actual arbitrations than John B. Moore, and I doubt if any other man, except Senator Henri LaFontaine, of Belgium, is as well informed. Mr. LaFontaine occupies in Europe a position similar to that held in America by Professor Moore.

Not only has Professor Moore, the historian of arbitration, taken this advanced position, but Theodore Roosevelt, the arbitrator in action, has declared, in a message to Congress, in favor of some sort of International Police Power, and also for some form of International political organization.

But the President's very position necessitates his going carefully in this grave question of State. The significance of these declarations by him seems to have escaped not only those politicians whose vision is bounded by mere local interests, but even the professional peace people have evinced but slight appreciation of what this means.

And now we have Mr. Bartholdt, a Member of Congress for fourteen years, the head of one of its most important committees, the organizer and president of the arbitration group, also president of the Interparliamentary Union. He does

not abandon the actual work of government to become a "rainbow chaser," as he is fond of calling the impractical dreamers. The dreamers he believes in are those who can make their ideas take form and body, so as to become operative. He not only joins hands with Professor Moore and the President, but he has even said what sort of international political organization we should have and what sort of international police power should be placed behind its Judicial and Legislative Branches. In THE INDEPENDENT of May 11th, 1905, he set his hand to twelve propositions, which outline the form of this organization, and since then he has been busy making it assume this form.

Proposition 12 is as follows:

"12. The armed forces of all the nations represented to be at the service of the Congress for enforcement of any decree rendered by The Hague Court, according to treaties of arbitration."

This proposition is very reasonable, because each nation is to remain free to arm itself as its interest may seem to require, and also to use force in the settlement of *every* question with *any* other nation, unless it has solemnly agreed to permit a court to render judgment in the particular question or class of questions in dispute. Under such circumstances why should not all the nations place their armed forces at the service of the International Congress to compel respect for international law, duly adjudged, in cases *which have been solemnly and deliberately transferred from the arena of war to that of reason by treaties of arbitration.*

Henri LaFontaine was the only European who took Mr. Bartholdt's arm to walk with him the full length of his proposition. He even dared to go a step or two beyond Mr. Bartholdt's most advanced position.

Count Albert Apponyi, the great Hungarian statesman, approves proposition 12 personally, but considers it must be stricken from the program for the moment on account of anticipated opposition from European Monarchs.

So the proposition now put forward by Professor Moore has taken tangible form and found able advocates occupying high position. Mr. LaFontaine occupies the chair of International Law at a European university and also a seat in the Senate of Belgium.

Count Apponyi is in the Cabinet of Hungary, and, in co-operation with Francis Kossuth, can control the action of that great nation.

The present President of France has presided at sessions of the Interparliamentary Union, and has appointed as Minister of Foreign Affairs M. Leon Bourgeois, who was one of the men who took part in creating the Interparliamentary Union, and who is on the most intimate personal and political terms with Baron d'Estournelles, the French member of the Interparliamentary Commission.

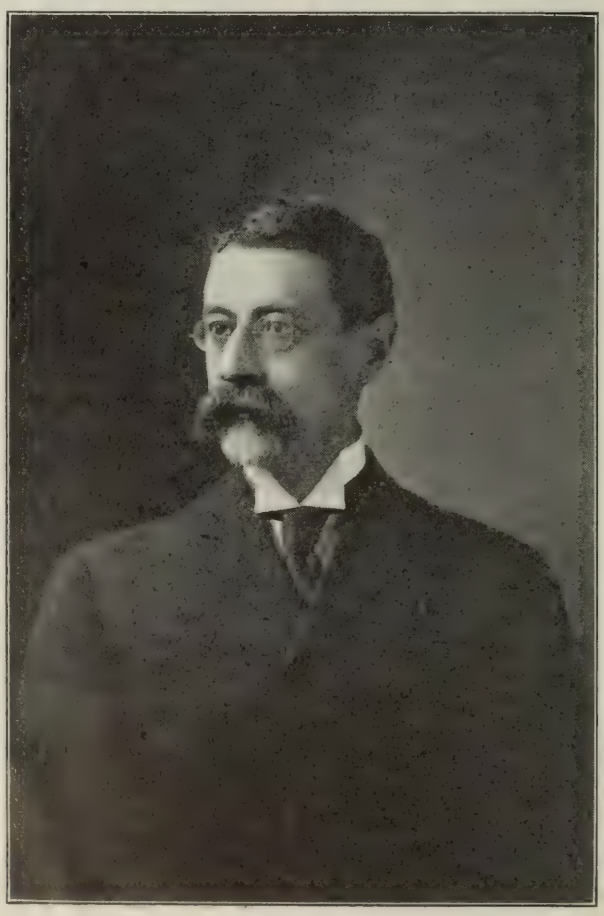
Sir Henry Campbell-Bannerman, the present Premier of Great Britain, declared in his first official address that he is for forming some sort of League for Peace, and has followed this word by a good deed, elevating Sir Philip Stanhope, the president of the Commission, to the Peerage, in recognition of his great services to his country and to the cause of peace and progress.

So our friends have now a practical assurance of support from the heads of four great nations; and the day of our final triumph is certainly not distant.

Under such circumstances it would not require great intellectual courage to declare one's faith in the early creation of a Congress of Nations, having a clearly defined sphere of jurisdiction, and cooperating with the half-hundred National Legislatures, as our Federal Congress cooperates with the fifty State Legislatures on which it reposes, and backed by a duly constituted and effective Executive Power for enforcement of the law of nations.

NEW YORK CITY.

South America and the Peace Movement



BY SENOR DIEGO MENDOZA

[Señor Mendoza is the present Minister from Colombia to the United States. He is leader of the Liberal Party in Colombia, whch is the party of progress, and corresponds to that party in other countries which is struggling against established errors. Señor Mendoza has been president of the Republican University, and is now Professor of International Law in this university, which is situated at Bogota, and is the center of education among Colombians who are for freedom of thought. He is a member of the Colombian House of Representatives at the present time. Señor Mendoza is also noted as an author, having written among other things, "The Thought of the Founders," "Evolution of Property in Colombia," "Diplomatic History of Greater Colombia," "Interoceanic Canal and the Treaties." He is a nephew of the great Perez, who resisted Nunez, President of Colombia, in 1885, when the latter declared that the constitution of Colombia was abrogated and that he was the State.—EDITOR.]

I MUST express my grateful acknowledgment of the initiative of the American group of the Interparliamentary Union which resulted in the issue of invitations to all American Parliaments to join said Union, and in the appearance, at the Brussels Conference, of four Latin-American Parliaments.

I had the honor to arrange for the representation of Colombia at that Conference in the person of my country's Minister to Switzerland, who is also a member of our National Assembly. I regard the entry of the Southern Republics on this continent, into the Interparliamentary Conference as one step further in the world's progress, and the credit for it must be placed upon citizens of this great Republic.

I have been so favorably impressed with the propositions advocated at Brussels by Mr. Bartholdt and his associates of the American delegation, that I have submitted to my Government the draft of a general treaty of arbitration which was proposed by Mr. Bartholdt, and I do not overstep the boundaries of diplomatic discretion when I express my personal approval of the main ideas in said treaty. Furthermore, I have recommended that the program of the Second Hague Conference contain a clause under which the nations represented can discuss the best way of making suitable provisions for similar conferences in the future. This will open the door for discussion of the project for a Permanent International Congress, which has now received the sanction of the Interparliamentary Commission, but which was first put forward by Mr. Bartholdt, the president of the American delegation.

Señor Diego Mendoza.

Two events in South American history have an appropriate place in memory at this moment.

It was Bolivar, the Great Liberator, who was first among all Americans to conceive this idea and to take practical steps for its realization. Having succeeded in freeing a great part of South America from the oppression of hereditary rule, he proposed the uniting of all America by means of a Perma-

nent Pan-American Congress. The Congress met at his invitation at Panama, while he was President of Colombia. The United States delegates arrived too late, because of a contention between the President and Congress of this country in regard to attendance.

Unfortunately, Bolivar's grand design was regarded as premature in the year 1826, just as a similar plan of Henry the Great of France, for the unification of all Europe, was considered premature when Elizabeth was reigning in English politics and Shakespeare in English thought. But time removes many difficulties, and the countrymen of Bolivar and of Henry the Great will not fail to stand by the bold leaders of the United States when they rise in the International Conferences and propose in the twentieth century, on a world-wide scale, the very means of perpetuating peace which these great statesmen contemplated on a continental scale one century and three centuries ago. Nor does it seem oversanguine to hope that the day of realization has now come. Already we have a second general congress of nations at The Hague, to which all nations have been invited, South American nations being included in the American Hague Conference in accordance with the declared wishes of the United States group of the Interparliamentary Union; and for the good will of this wish we, of South America, are duly grateful.

We are on the eve, also, of the third Pan-American Congress, and one part of the program calls for the discussion of provision for future conferences. All that is required is simply to make these two Congresses permanent institutions. It seems easy to believe, therefore, that the world will soon realize all the blessings that can come from having the permanent Pan-American and World Congresses, of which noble souls in other centuries could only dream.

Thus, the highest aspirations of Washington, Lafayette, Bolivar and Sanmartin, the liberators of North and South America, will be achieved by the banishment of injustice from the earth and of the plague of war which only follows in its wake.

WASHINGTON, D. C.

A Change of View

BY TUDOR JENKS

In days long gone when I was young
And sported shortened trousers,
I loved to celebrate the Fourth
With cannon-crackers—rousers!
And while I blew the ashy punk
To fire the sparkling fuse,
A slender lad would linger near,
A victim of the blues.

One lone torpedo now and then
He'd listlessly let fall.
Its faint report could not avail
To cheer his gloom at all.
He was my neighbor, Rupert Jones,
A clever, kindly boy,
To whom his father had denied
Gunpowder's thrilling joy.

Oh, how I scorned that Mr. Jones,
A man of mild demeanor;
No Cavalier for Puritan
Held ever hatred keener!
He'd pose us with this argument:
"If noise is what you seek,
Pound with a rock upon a plank,
'Tis safe, and lasts a week."
I'd listen with a bitter sneer,
Then turn upon my heel.
But now that I'm a father, too,
I know all Jones did feel.
For passing years have brought gray hairs
And wisdom in their train—
I sympathize with Mr. Jones,
And long for him in vain.

I see in him a man of sense,
Who scorned all aimless noise—
Who nursed a harmless prejudice
Against dismembered boys.
So when I take an early train
To hie myself away
Far from the dangers and the din
Of Independence Day,

If I could know just where he lies,
Upon the Fourth, each year
I'd seek the elder Jones's tomb
And thereon shed a tear!

The signing of the treaty of peace between Great Britain and the United States, at Paris, September 3d, 1783, by Benjamin Franklin.

Bettering Our Diplomatic and Consular Service

BY NICHOLAS LONGWORTH

[Mr. Longworth, Member of Congress from Ohio, has begun an agitation for providing our representatives abroad with better facilities for living at their respective posts than they have at present. He has introduced a bill in Congress authorizing the purchase of homes for American embassies in European capitals. The following opinions of Mr. Longworth were given in a recent interview with him on the subject, by a representative of THE INDEPENDENT.—EDITOR.]

IN the suburbs of the city of Cincinnati is a miniature farm. This farm is owned by a woman who depends on it for a livelihood, for altho she has a so-called pension from the Government, it is a mere pittance, on which she could not possibly exist if it were not for the patch of land she calls her own. This lady — for a lady she is — is obliged to raise mushrooms for a living, yet only a few years ago she was one of the most prominent women in American official life—the wife of our former Minister to France. When General Noyes was appointed to this office in 1877 he had a fortune of $150,000. When he died his widow was left practically penniless. Every dollar of his fortune, in addition to his salary, had been required during his residence abroad to meet the expense necessary to live in a manner befitting the dignity of his position.

Nicholas Longworth.

Such is but one of many illustrations that might be cited of the personal sacrifice absolutely required of the men who represent the United States in foreign countries. In the capitals of Europe the cost of maintaining a suitable establishment is so great that the majority of our Ambassadors and Ministers today disburse most, if not all, of the money they receive for their service in house rent alone. Take, for example, our Ambassador to Great Britain. We pay him $17,500 a year. It costs him actually $45,000 for a home. The Ambassador to Vienna has been fortunate in renting a house at an annual payment which is just equal to his yearly stipend—$12,000. These as well as the other officials in the foreign service must make up all additional expense out of their private incomes. Few, if any, secure revenue from fees or other perquisites in connection with their official duties. Any one familiar with the duties which the members of our diplomatic corps are called upon to perform is well aware that their success depends very largely upon their position or standing with the people among whom they are sent. To illustrate this point more clearly, suppose we consider the diplomatic corps of other nations at Washington. If the Minister from even one of the smaller countries resided in a suite of rooms or a less pretentious house than the one he occupies, his influence would be lessened, and the nation he represents would be affected accordingly. The homes which Great Britain and Russia furnish their embassies at the capital are most important

factors in contributing to the prestige of these Powers among Americans. So it is that our own diplomats find it essential to reside in neighborhoods and in houses in keeping with the rank of the nation they represent; but to do this necessitates an expense which, as I have intimated, is usually far in excess of their salaries, and even where they practice rigid economy, they are compelled to make up the difference out of their own pockets.

Such are some of the reasons for the bill which I had the honor to introduce at the present session of Congress, appropriating funds to purchase suitable homes at least in the European capitals for our embassies and legations.

The conclusions drawn from my observation while abroad at various times, and from a study of our diplomatic and consular service, are all in favor of such a measure, for there are many advantages, not only to our representatives, but to the American people, which would result if the United States owned every piece of property on which our shield has been raised, to show that, temporarily, at least, it is American soil. What would it mean to the families of our Ambassadors, our Ministers and our Consuls? It would mean a home which only a woman removed from her relatives, her friends and familiar associations, to a strange country among strange people, can thoroly appreciate. Perhaps we have thought far less of the women and children in our foreign service than we should. Some of the places where they have been housed have been apologies for dwellings, but there was no other choice. American ladies have endured and suffered not a little in many parts of the world, because, as wives of our Consuls, they were obliged to accompany them and live as best they could. I recall an instance where the man who represented the United States at Canton was obliged to rent half of a Chinese hut when he assumed the duties of his position. All of the Consuls live on a little island containing but two acres, because they would not be safe in the city. So crowded was it that only this miserable place could be secured for the time being. An American Consul to Persia was compelled to put up with a tent on arriving at his field of labor. He could not get anything else in the way of a shelter. But when they are so fortunate as to secure a "consular residence," it is often unfit to live in. Suppose a woman accompanies her husband to some post in Asia or Africa, how can she expect to have even the semblance of a home in a building constructed and arranged according to the customs of the native people, of which she probably knows nothing? She may bring some household necessities, but even with these it is usually impossible to have even the ordinary comforts of the life to which she has been accustomed, and if there are children they must suffer with their parents. The same argument applies to many portions of Europe where the United States is represented by Americans. The mode of life of the people is as strange as may be their language, and the housewife who tries to convert one of their dwellings into a home often finds it a hopeless task, and the life becomes merely an existence, from which all are only too glad to be released.

Unless a law is enacted which will prevent a married man from taking a consular position—which is not very probable — we must remember that there is often a woman in the case who deserves consideration as well as her husband. We will assume what is generally true, that she is accustomed to associations of refinement, to surroundings of comfort, perhaps luxury. At many of the stations she finds conditions exactly the reverse. She may be unable to have any intimacy with the people such as she enjoyed in America, and is as isolated in this respect as if she were in an uninhabited country. Her home and family become everything to her. She appreciates husband and children as never before. We will infer that the Government has bought a site for a consulate. This means that a house can be built, which, tho suited to the climate and character of the country, can be planned with the appointments of an American dwelling, and furnished with articles to which Americans are accustomed. Such provision made for our representatives in the more remote countries is a necessity if we expect to keep men at these posts who are qualified to perform their duties in a satisfactory manner. It will go a long way

to make them contented if their families are at least sheltered comfortably.

I need not say that the wives of our Ambassadors, our Ministers and other officials in the more important countries of the Old World, occupy very important positions from the standpoint of diplomacy. We are so democratic in the United States that most of us do not realize the conspicuous part which the social function plays in the politics of the Old World. It is absolutely necessary for the success of his mission that the diplomat enter into the social life of the capital to which he is assigned if his mission is to be successful. Many are the affairs of state conceived and planned at the dinner or the reception. Here the necessity of a suitable establishment is apparent. It is an unwritten law that the representative of a nation must entertain on a scale befitting the standing of the nation if its importance is to be fully impressed upon the people of other countries. The wife can give much valuable assistance in this respect by displaying her tact and ability as hostess, but to do so she must have appropriate surroundings. To give a dinner, for instance, in a hotel or *pension* would belittle the United States in the eyes of the European, just as he considers it beneath the dignity of any nation to establish its legation or consulate anywhere except in a residence which, for the time at least, is its individual property. These are some of the customs which must be rigidly adhered to, tho they often entail an expense which the average American may deem unnecessary, but which is absolutely required, as the one familiar with European ways well knows.

The policy was adopted at the very foundation of this Government of paying to our public officials a salary founded on the principle of simplicity and lack of ostentation in living, and thus the salaries of many of the great public officials are less in this country than in other countries approaching anywhere near us in wealth and power. No matter how strong may be the sentiment among the people of this country for Jeffersonian simplicity, surely no one can argue that a salary should be paid a public official which should not enable him to live at least in a manner commensurate with the dignity of his position. It is a grievous mistake to fix the salary of any office in the gift of the American people so low that only a rich man can accept it. Yet this lamentable condition is true of many of the positions in our diplomatic service. If we contrast the salaries paid by European nations to their representatives in the United States with the salaries paid our representatives abroad we will find that there is not a single European country having an Ambassador in the United States which does not give him a compensation larger — perhaps three times larger—than what we offer to our officials of the same rank. More than this, there is hardly a country represented at Washington by an Ambassador that does not actually own its embassy in every capital of Europe. In the few instances where such countries do not own or lease an official residence for a long term of years they invariably allow their Ambassadors a substantial sum of money for house rent. Nor is there a single one that does not make a further allowance, in addition to salary, for maintaining the embassy and for incidental expenses. Take Great Britain for example. The salary of the Ambassador at Paris is $45,000; Berlin, $40,000; Vienna, $40,000; Rome, $35,000. In each city the embassy is owned by the British Government. Germany owns its official residences in London, Paris, St. Petersburg, Rome and Vienna, which are at the disposal of its Ambassadors, who receive from $25,000 to $37,500 in addition. Russia not only owns her embassies in Europe and this country, but allows from $5,000 to $6,000 to each for expenses besides the regular salaries. Even Italy makes an allowance of $18,000 annually for house rent and entertainment, besides the salaries of its principal diplomats.

It may be argued that other nations are extravagant in their appropriations for foreign service, but there are abundant instances to show that such is not the case. There is the illustration of Lord Dufferin, who was compelled to resign his position at the French Embassy on account of the legitimate expense incurred above his salary and allowance. When the position was tendered to other English statesmen no less than three declined it, giving as the reason that they

could not afford to accept because of the tax which would be made on their private income.

It is idle nowadays to talk about the sentiment for the simple life in diplomacy. It is a fact that not a single American Ambassador, and, for that matter, the great majority of our diplomatic representatives, can conform with the diplomatic customs of the countries where they are stationed and keep within the limits of their salaries. It is not a question of theory as to what it should cost. It is a question of what it must cost to live in keeping with the rank of the nation for which one stands. He cannot receive official visits in a three-room flat, nor can the hostess entertain her guests in the diplomatic circle on bread and milk, without bringing the American people into contempt and ridicule.

A story has been told in this connection of one of our former Ministers in a European capital, who established the legation in a suite of rooms so small that visitors were unpleasantly greeted with the odor of cooking. To complete the impression they may have gained from the meanness of the surroundings, the "host" had a habit of receiving every one, from ambassador to envoy, in his shirt sleeves. At the end of the visit he would hand the guest his card, with this remark: "Consider your call returned." It can be readily imagined how our foreign friends who have not visited America would regard this country after such an experience.

I have already referred to the necessity of the official residences of our diplomats being located in suitable neighborhoods of cities to which they are assigned; but where they must rent a place, its locality may depend too much on their generosity toward the American people. If a millionaire, the official may decide to go into the ultra-fashionable quarter. If he is merely "well off," as we call it, his home may be on one of the back streets, perhaps; but we can only surmise where the ambassador who has a moderate or meager income might dwell, for if we had no rich men available, the office of ambassador would probably be vacant, especially if the wives are to be consulted, for few would care for official life, brilliant and enjoyable as it might be, if it ended in abject poverty, as has been the case too often.

Could any condition be more deplorable than that wealth alone should be a necessary qualification to fill such a high office? Yet year by year the truth of this proposition becomes more firmly established. I venture to say that only a few men in public life today, qualified to represent us abroad by reason of their mental attainments, are financially eligible. It is merely our singular good fortune that we have been able to fill the most important posts in European capitals with men of ability who also have incomes to allow them to hold such positions.

But there are several other important phases of this subject which should also be referred to. In China it is actually dangerous for one of our consuls to live out of a compound. Unless so protected, he and his household are liable to be attacked by the disorderly native element. Here we should own land on which houses can be erected strong enough to give protection to the occupants, while they can be modeled to form suitable living apartments, as well as offices for the consul. This argument can be applied in general. The consulate is usually the place where official business is transacted, as well as affording a residence. It is frequently very difficult to rent a building at any price suitable for both purposes. In connection with the office, especially where the station is of importance, facilities for safeguarding the many valuable documents on file should be provided. There is continual danger of fire, often of robbery, and a fire-proof compartment or vault is very necessary.

The diplomat from the United States who endeavors to secure a building for his headquarters usually has to pay a much greater rent than any one else. The average foreign landlord thinks we are green, and if he finds that his property is wanted for the consulate or embassy, is apt to put a much greater valuation on it than to his own countryman. This partly accounts for some of the high rents in the larger European cities —sums so large that if the property were bought the amount would represent

but a few of the annual rent payments. It is actually business economy, in my opinion, for the United States to buy sites in such cities as London and Paris for its official residences, for not only the rent would be saved, but in these, as well as other large communities of Europe, property is steadily appreciating in value.

I believe this subject should appeal to every American woman when we remember how many of the sex are associated with our consular service, and the important part they assume in connection with it. Have they not the right to the conveniences and comforts which a permanent home might afford? It is not unreasonable to provide suitable buildings and appointments for the women as well as men who represent us among other peoples, remembering how essential is their effort in maintaining our prestige with other countries. I feel that the women of the country can be of much assistance in the adoption of the bill pending in Congress, if individually or as organizations they will urge its necessity upon their representatives.

You Retainers

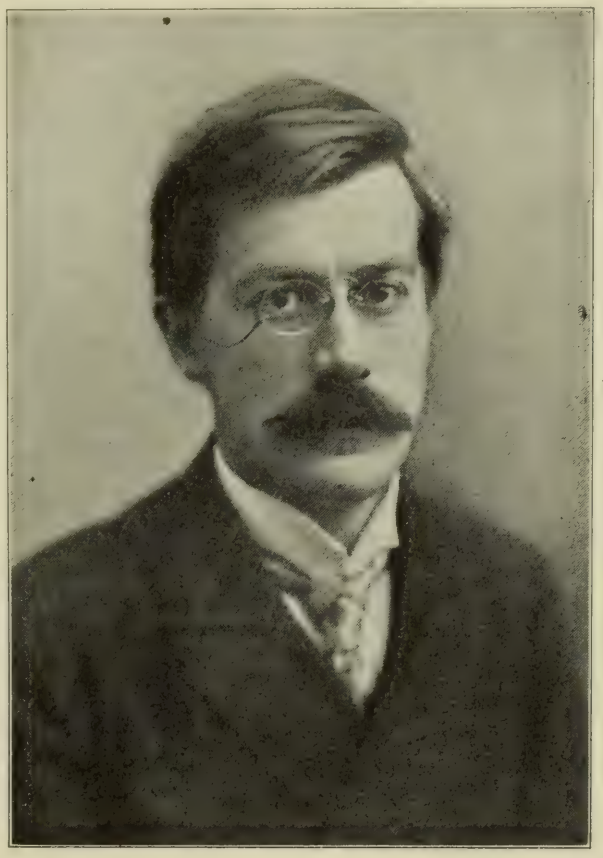
BY W. J. GHENT

Author of "Our Benevolent Feudalism," "Mass and Class," Etc.

YOU publicists, professors, teachers, ministers, editors, lawyers and judges—you who defend the existing *régime* and oppose the struggles of the working class for a better life; you whose business it is to find a practical, a juridical, an ethical, and even a spiritual sanction for things as they exist, and who prate and drone the cheap moralities which are the reflex of the interests of the class that employs you—there is a word to say to you which needs to be spoken. Upon those who take part in the forward movement of the time no more pressing duty is laid than that of telling you in plain words what millions of men are thinking of you, and of arraigning your consciences and discrediting your teachings.

You are honest in that your expressions are the direct and inescapable results of your means of making a living. You serve, as your intellectual forbears have ever served, as the expounders of the special moralities which the ruling class has ever sought to impose upon the ruled. But you are dishonest in that you do not acknowledge the class character of your teachings, and in that you seek to give a social and general sanction to what is purely an expression of the needs of your employers. "Wherever," says John Stuart Mill, "there is an ascendant class, a large portion of the morality emanates from its class interests and its class feelings of superiority." And as your predecessors formulated the interests of feudal baron or slaveholder into ethical precepts binding upon villein or slave, so do you formulate the interests of the capitalist class into an ethical code binding upon wage-earners. Yours is a servile ethics—an ethics handed down to you from above, to be disseminated among those below. You do not make discoveries in morality. Such discoveries are made *for* you. It is not until, in the gradual flux of conditions, the teaching of a special morality comes to be necessary to the ruling class that you learn what is moral and what immoral.

How many of you realized that the "open shop" was eternally bound up with the True, the Good and the Beautiful until the recent collective reaction of the employers against trade unions forced it upon your attention? Might not the "heroism of the scab" have remained to you an unapprehended virtue, a moral flower "born to blush unseen," had not the general warfare against the unions these last few years forced you to a recognition of the strike-breaker's value to the factory lords? You extol, in fer-



vid phrase, the "right to work," and protest against its infringement. But does the real "right to work" ever touch your consciousness? That 6,468,964 workers in gainful occupations were unemployed for more than one month; that nearly half of these were unemployed for from one to three months, and three-eighths of them for from four to six months, in 1900, is small part of your distress. You have discovered only the evil of the unemployment of that infinitesimal fraction who are prevented from displacing union men. The enormous volume, the intense degree, of privation which these figures reveal have little or no meaning for you. That millions of human beings may sicken and die thru want of the barest comforts of existence is a consideration you leave to others. You are troubled only by that minor part of the problem which touches adversely the interests of your employers.

You prate, too, of "violence." The frightful violence, indirect though it be, by which every year more than 60,000 beings are hurled to death and some 1,600,000 seriously injured, is not what you mean. That the butchery of the Civil War is being repeated, year after year, thruout the industrial plant of the nation, does not move you. You preach no homilies upon *this* form of violence; you do not talk of it to your classes in economics; you give it small mention, if any, in your platitudinous editorials. Nor are you moved by that other form of violence—tho still more indirect, yet still more fatal—the forcing of beings to work at tasks which kill slowly by poison, by disease or torture, instead of mercifully at a blow, and which annually claim an uncomputed army of victims. All this you pass by as the necessary and inevitable fortune of the poor, to be borne by them in patience. That is, when you notice it at all; for many, if not most of you, habitually shut your eyes and ears to the sufferings and cries of outraged humanity.

But when you see or hear of a union workman attacking the man who has traitorously taken his job, all your latent indignation is awakened, you cry out in horror, and demand "a wall of bayonets from Washington to Wilkesbarre," or some other mode of instant and rigorous repression. The robbery, the torture and the slaughter of a race mean little to you, because these are the price which must be paid for the rent, interest and profits of the class which keeps you going. But the incidental violence of the striker means to you a crime against humanity, against the universe, against the Almighty. Did you ever dig down into your inner selves to try to discover the reason why your indignation is spontaneously awakened by the one thing and not by the other? It is safe to say that you never did. For then you would have discovered that it is because you have no social conscience. You have only a servile class conscience. You absorb and reflect the interests, the instincts and the feelings of the class from which you draw your sustenance. And whenever the interests of that class are trenched upon, as when a workman is prevented from working more cheaply than another, you are shocked as by an electric current.

You were long in awakening to the evil of child labor. Your forbears in England were equally obtuse, and they busied themselves for years in inventing grave objections to the proposed reforms. Nothing was better for young persons than work, they said. Education was on the whole harmful for the children of the working class, because it tended to unfit them for the station which God and the factory lords had ordained for them. And idleness, even for the very young, was worse, since it made them the prey of vicious habits and engendered in them an ungodliness of heart. Many of you who live in the factory regions of the South are today repeating these old inanities. And for those of you who live in the North, you had best look and see if an economic cause is not back of your sudden awakening. Until the needs of manufacturers in the North (where child labor has been restricted largely by the influence of labor unions upon legislation) demanded an interference with the cheaper production of the South, how many of you had ever troubled yourselves regarding this frightful evil? Not many; and for that matter, not many of you are worrying about it even now. For, to the manufacturers and

traders of the North the restriction of child labor is not an unmixed blessing. What is wanted is just enough regulation to bring about an equilibrium between the cost of production in each of the two sections. It may go too far and seriously inconvenience the gleaning of profits. And so long as this is so, there is abundant motive for many of you keeping quiet. To such of you the whole industrial world may turn, pivoted upon a child's heart, and you, your "glassy essence" reflecting only the interests of your employers, may remain serenely oblivious.

William J. Ghent.

No, you have small need and less inclination to prosecute discoveries in morality. Your trade is rather to excuse or sanction the thing that is, to allay the unquiet of the masses, and to denounce the "wicked agitators" who would fain awaken the people to a sense of their power. It is a good world, you say. Cautiously you admit that it is not what it might be; but if all would invariably do the right and proper thing, you say, all would be well. And so, by tongue and pen, you coax and persuade the toilers to keep at their plodding tasks, to bear with patience hunger and cold, illness and wounds, and the thousand privations which are their inescapable lot. Your employers must reap their rent, interest and profits. And how can they reap unless the masses sow?

The seditious and subversive agitators stir them to complain. But for each complaint you have a ready specific. Is life, as they say, under the sway of the prevailing *régime*, merely a game, a lottery, a universal Monte Carlo? Then beat the game, say you. From your university chairs, your rostrums, your pulpits, and your editorial desks, you blandly tell us, just as do the runners and "cappers" of a faro bank, that this or that plan or "system" will assuredly do the trick. Now, it is Morality, and now Sobriety; now it is Faithfulness, and now Hard Work; now Thrift and now Efficiency. And tho many of you know in your hearts that none of these things will do, yet still you proffer these counsels to the generations that toil and suffer and pass away and find no answer to the painful riddle of life.

Not in Morality, as you preach it, does the working class find its salvation. For in even the best ages the sleets and snows of misfortune have fallen alike upon evil and good; while in the worse ages, given up to competitive and fratricidal strife, morality becomes a hostage given to fortune, leaving the victory to be won only by the unscrupulous, the strong and the inhuman. Nor is sobriety other than a trumpery counsel which blinds men's eyes to their real wrongs. That men, and especially workingmen, might all desist from strong drink is a hope which all may justly hold. But that such abstinence would have other than the slightest effect upon the present distribution of the world's goods is delusion, or something worse. Faithfulness, as you mean it—an unquestioning devotion of the worker to the interests and aims of his employer—is not only not a virtue, but a social crime. For it makes men partners in their own exploitation; it blinds them to the fundamental antagonism of interest between themselves and their employers. Let, indeed, the workman play the game fairly, as the game is played; let him ren-

der a fair sum of efficient toil for a prevailing rate of wages. Under the rules of the game he must always produce by his toil a far greater value than he receives in wages, else capitalism could not endure for a moment. And the worker must accept the rules or he cannot take part. But to ask him to merge his interest in that of his employer is to ask of him a subservience which lowers him from the status of a free man to that of a serf.

Nor is it by means of Efficiency, as you call it, that the salvation of the working class is to come. For by it you mean, not social efficiency, the ordering and regulating of the processes of production to make them most fruitful. You mean individual efficiency, the sharpening of beak and claw for a more intensive and cruel warfare. Surely, tho, this remedy has all the hollowness and futility of the others. Is efficiency possible to but a part of the race? It must be so, since you are ever declaiming about the incompetent, who have none but themselves to blame for their poverty. Then efficiency can promise but a Presbyterian sort of salvation to the elect. Or is it attainable by virtually all? If so, what change would it work in the inequalities and privations of life? Small change, indeed, for were we all the efficient equals of Mr. Morgan or Mr. Rockefeller, the rough work of the world would still have to be done, and the doers would have to be those who rightly, according to the doctrine, should be doing something better. And then did you ever consider the enormous and increasing disparity of numbers between wage-earners and bosses? There are, for instance, more than 1,200,000 railway men, and not 1,200 of these are general officers. If the 1,198,800 developed an efficiency equal to that of their superiors, would they then all become general officers? Where are the places for them, and who would do the hard work? Your "efficiency" is only a lure which you use to keep alive in the worker the credulous hope of individual success.

Nor is Thrift, nor is Hard Work, the way out. Millions of men have toiled faithfully all their lives, and other millions have both toiled and saved, only to die in poignant want. The product of men's toil, and no less of their thrift, is drawn into other hands, and the workers close their lives in poverty. In London, where the processes of the capitalist system are allowed a virtual free play, one person in every four of the entire population dies on some form of public charity. In New York, where the struggle is in some measure modified, one person in every ten is buried in Potter's Field. And were it not for the intervention of private charity, of benevolent societies, of labor unions, and of political leaders, it is possible that the number of pauper burials would approximate that of London. To preach toil to men who have always toiled when they could, and who see before them only the pauper's grave, is a shameless mockery. And then did you ever stop to inquire where the work which you urge men to do is to come from? Do you not know that the needs of the present system require an ever-increasing army of the unemployed? And do you not know that the figures show incontestably this growing army? Or are you too fatuous in your service to your masters to study the figures and to learn their lesson?

No, none of the proffered "systems" will beat the game of the great industrial Monte Carlo. They have all been played, over and over again, and tho here and there an individual winning is made, the masses remain plundered and poor. And the most conspicuous result of your exhortation and advice is to aid in keeping them so.

Is life not only a game, but in its fiercer phases a battle, as the "agitators" say? Is it true that thousands are struck down in death and hundreds of thousands put out of the fighting by wounds and disease? Then, say you, seek a safer place in the battle; exercise your freedom of choice, and avoid those occupations that are dangerous. Did you ever, for even a moment, put yourself in the worker's place that you might consider the degree of his choice? Do you not know that such is the pressure upon him that he must seek work where he can get it, whatever the conditions? That for the bare chance of earning his bread he must often face hazards of maiming and death vastly greater than those of a soldier in the bloodiest of wars?

And if your own tasks were equally dangerous, could you meet the question with such easy complacence? If during every year 1 out of every 9 of you were wounded, and 1 out of every 120 killed, would you not see the matter in a different light? These are the figures of casualties among trainmen for the year ended June 30, 1904. Or suppose that only 1 in every 19 of you were wounded, and only 1 in every 357 killed, would it not still be a lively question with you? These are the figures for the 1,296,121 railway employees for the same year. If you had to spend your working hours amidst unguarded machinery; if you were forced to breathe air clouded with metallic dust, or the fluff of cotton, silk or flax, or the fumes of molten white lead, would you not find something seriously at fault with the existing *régime* of industry? Doubtless you would not strike. For you have small sense of a community of interests with your fellows of like tasks, since virtually the whole range of your ethical feeling is but a reflex of the interests of the class above you. Nor would you have the moral courage for such an act. For you have a haunting fear of privation. That specter of poverty which the worker knows so well, which appears at his cradle and follows him all his days, and which he learns by familiarity to jest with and provoke, is to you a monster to be kept at the remotest distance. And so you would not tempt privation by a strike or by wild talk of a social revolution. But you would cringe and whine and beg for better things.

Did you ever pause to think of the debt you owe the workers? In a million fields, in a multitude of factories, in mines and forests, men, women, and even little children are reaping and sowing, hammering and planing, gathering and piecing together the products which make the wealth of the world. From some part of this wealth, a little from each worker, are taken and assembled the mites that make the enormous fund which society puts aside for your maintenance. Though the state or the magnates are your immediate paymasters, *you are in reality the pensioners of the working class.* The workers toil at hard and bitter tasks that you may be employed at tasks which are light and congenial. They strive at toil which slowly warps and disfigures their bodies or poisons their veins; or with a frolic welcome they brave chances greater than those of a soldier in the field—and all that you may follow your pleasant vocations, well clad, well housed and secure from harm. Multitudes are chained to a deadening monotony of labor, robbed of all opportunity of initiative and of creative expression—labor which slowly darkens their minds and benumbs their souls—while to you are given the tasks in the products of which you may enshrine what is best in you. They grow old before their time, and they die at half your age. Each of you will have seen, before you have passed your intellectual prime, two generations of toilers descend to the grave. The fruit of their toil has been gleaned by others, and to you has been given a bounteous share. All that you have is from them, and what return do you make for it?

They do not begrudge you your easier lives, so long as they feel that you are rendering a service to the race. The patient endurance of the poor is no more the marvel of the universe than is their devoted sacrifice. The workers realize, as none others can realize, what has been denied them, and they seek to secure it for their children. Every instinct which develops in them as a necessary outgrowth of their lot pleads for an infinite extension of social service. And wherever the instincts or ideals of the working class have found expression thru government, they have manifested themselves in the amplest provisions for learning and the arts. "The republic has no use for savants" was an apothegm of the petty *bourgeoisie*, never of the proletariat.

But when they find you soothed with the "execrable complacence of your prosperity," proud of your subservience to your capitalist masters, and glorying in your ineffable meanness of spirit, turning upon them and rewarding their toil for you with sleek counsels to be patient and to endure, their indignation bursts forth in a torrent. They loathe, they despise you. Because you can be happy in your creative work, you counsel them to find pleasure in their monotonous and

joyless tasks. Because fashioning the things in which you can embody your heart and soul, and no less your material interests, you can work long hours, you urge them to give to their masters long hours at tasks in which they can feel no interest and which rob them of health and life. You do this because it is needful to your capitalist masters that you do it.

So wholly are you centered in your tasks of serving your masters that you are inhibited from developing a sympathetic imagination. You cannot put yourselves in the workers' places. You cannot comprehend their lot, nor can you even apprehend their feeling. You are thus enabled in the same moment to disavow the debt you owe them and to

"Insult, exult, and all at once,
Over the wretched."

What Lear felt on the wild heath, as he thought of the "poor, naked wretches," whose "houseless heads," whose "unfed sides," whose "looped and windowed raggedness," made them the sport and prey of the elements, never comes to you. The humbled king could moan out,

"Oh, I have ta'en
Too little care of this!"

But you, complacent alike in your prosperity and your subservience, can only turn upon them with angry impatience and counsel them to go to work and keep quiet.

With what eager impulse and complaint will you make yourselves the defenders of the present scheme of things and the assailants of the coming order! Now that in every civilized land the working class, sick of the reign of cruelty and wrong, is awakening to a consciousness of its power, and to a determination to ordain a fairer life, you take upon yourselves the mission to ridicule its aims and ideals, and to discredit its leaders.

It is only the unsuccessful, you say, who attack our existing institutions. You cannot understand, such is your subservient complacence, that multitudes among this revolutionary working class are proud of their unsuccess and wear it as a badge of honor. Pray you, under the existing scheme of things, how many and what quality of men achieve "success," and what must they not do to achieve it? It is not, except in rare cases, probity, nor truthfulness, nor humaneness, nor fellow service, that wins this fallacious good. It is, in the majority of cases, grafting and lying, fawning and cringing, selfishness and brutality, restrained only by that Chinese ethical standard, the necessity of "saving your face," that give victory in the struggle. And the men who are seeking the overthrow of this system disdain to make use of these means. They leave the function to you. They do not, like your bishops, lend their presence to Chambers of Commerce at banquet, and give to the gamblers in the world's wealth the benediction of divine favor. They do not, like your Boards of Foreign Missions, solicit the profits of lawbreaking and theft for their propaganda, and promise an intercession at the throne of grace. They do not, like your college heads, prescribe the dainty punishment of "social ostracism" for the world's robbers, and then accept the fruits of the robbery, crying out from their gables, "Bring on your tainted money!" Nor do they, like your journalists, make themselves the servile lackeys of the ruling class; nor, like your economists, constitute themselves the secular priests of capital, perpetually renewing their character of "pests of society and persecutors of the poor." Many of them might be "successful" if they chose to do these things. But they choose not to do them. Rather they choose, like Francis, the bride Poverty, instead of the harlot Success. And so you are right in your statement. But you utter your own condemnation when you speak it.

The thing which, as the structural basis of a fairer life, these men strive for—the common ownership of the means of production—you assail with sweeping condemnation. Few of you, save for a select group among the teachers, have ever so much as considered the proposal. The identity of your thought, the virtual identity of your language, when you speak of it, shows unmistakably that you draw your pabulum from a common source. Most of you would, of course, assail it with equal virulence if you knew more about it; for your in-

stincts and beliefs reflect the instincts and beliefs of your employers, and you feel and see as they. But knowing the subject only as you do, you have only a common stock of phrases which you employ in its condemnation.

You prate of the folly and sin of "dividing up," studiously ignorant of the fact that what these men propose is to terminate the enforced dividing up which everywhere prevails today, and to substitute the holding of productive property in common. You prate of a certain "menace to woman," blinding yourselves to the fact that the salvation of woman is to be found alone in her economic security, and that under our present system, whether in wedlock or prostitution, women are bought in the open market like potatoes. Actually or feignedly you distress yourselves with the thought of the "coming destruction of the home," oblivious of that visible present devastation of the home, moral as well as material, that goes on increasingly and inevitably under the processes of capitalist accumulation.

You are tenderly solicitous of liberty, too, and fearful that this revolutionary working class may ordain a universal slavery. What liberty has any part of the working class today? And what liberty, pray, have you, except the liberty of saying and doing what is expected of you by your masters? Few of you have any real concept of liberty. You look upon it as only the absence of governmental restraint. The myriad restraints upon freedom of belief, speech and action, and upon self-development, which are the inescapable results of an economic system wherein one small class owns all the machinery of production, do not occur to you. You make a fetish of the abstraction of liberty; the substance of liberty you do not know. You cannot see or understand that real liberty is a power, a capacity, mutually exercised and mutually secured. It is not a shadow, but a substance. "The restraints of Communism," as the younger Mill well said—and he was no over-friendly judge—"would be freedom in comparison with the present condition of the majority of the human race."

You are fearful of "confiscation," too, and of the assertion by the working class of an equal ownership in the means of production and of the equal worth and dignity of labor. You find beautiful beyond expression the sentiment of Pippa's song:

"All service ranks the same with God."

Only you want all service to rank the same with God alone. The mere suggestion that it should so rank with men is to you seditious and subversive of our glorious institutions. And now that chattel slavery has been abolished, you can thrill—such of you as yet retain some residual emotion and are not held to the mere "passionless pursuit of passionless intelligence"—at the sentiment of Emerson's lines:

"Pay ransom to the owner,
And fill the bag to the brim.
Who is owner? The slave is owner
And ever was. Pay him!"

But these words express an ethical verdict on a past age. The economic sanction for the robbery of the slave has gone, and with it the moral sanction. No slave-holding class now dictates to you the special moralities which it is needful that you inculcate to the robbed. But let some irreverent person substitute the word "toiler" for the word "slave," and instantly you are shocked with horror. "Confiscation!" you shriek, and every instinct of antagonism within you awakens. And why? Because, tho there is no longer a slave-holding class to dictate to you your ethics, there is a ruling class of capitalist owners of the means of production, holding to you the relation of masters, and by the interests of that class your ethical standards are necessarily formed.

For your lighter hours you have recourse to tawdry phrases that have grown threadbare thru eager and ignorant handling. "You cannot make men rich by legislation," "you cannot make men good by legislation," "you will destroy initiative," "you will eliminate individual responsibility," "you will reduce everybody to a dead level" are some of these collocations of words. And how you plume yourselves upon your superior "cultivation" as you look upon the "lower stratum of society" and tell it what is good for it and what to avoid. You do not choose to remember that in every age "cultivation," as manifested by your class, has been the lackey of priv-

ilege and oppression; and that the learning which was made possible for you by the toil and sacrifice of the workers you have ungratefully used against them. You choose to forget that in every age your class has framed just the sort of formulas for reproof and exhortation which best accorded with the interests of the ruling class. The hollowness of your present phrases is but a characteristic of all the hortatory phrases of your class since first men enslaved their brothers and called upon priest and teacher to sanction the act.

How solicitous you are regarding the maintenance of initiative! As if the whole progress of civilization had not been attended by a setting of bounds to the range of men's lower initiatives and the opening of fields for initiative on higher planes. And as if, furthermore, the impulse to action could never be anything else than the expectation of getting something from your neighbor! The Levantine pirate, when piracy was abolished, felt just the sense of outrage from the restriction of his freedom of action that the factory lord of today feels over a restriction in the hours of child workers. Initiative is born with man, as hunger and thirst and aspiration are born with him; and the closing of the opportunity for initiating methods of plundering one another of the means of life, which the capitalist system maintains, will but set free the incentives of men to a wider range of nobler initiatives, individual in their expression, tho social in their aim, and wholly obviatory of that "dead level" which you so keenly deplore. You may notice, also, when you take time to think of it, that thruout this period of the restraining of men's initiatives the sense and degree of men's personal responsibility has steadily increased.

And, then, how childish is your stock phrase regarding goodness and legislation. You seem not to understand how far from the purposes of the revolutionary working class is "legislation," as you mean it, ordering men to be "good." But waiving this, your phrase evades the truth of what we know, and you know, to be operative even within the untoward environment of a system that prompts men to do evil for gain. That small body of law which has a really social function —that body of law which sets new restraints upon the brutal and fratricidal struggle among men—is assuredly one of the decisive factors in moral development. For the restraints imposed by the law in one age become a basis of conscience in the next age. To at least this extent, if to no further, men are indubitably "made good by legislation." And last, you would do well, for at least two reasons, not to harp too assiduously on that other and twin phrase regarding legislation and riches. First, because it is not, as you seem to think, an argument against the aims of the workers, since they do not propose to "make men rich by legislation"; and, second, if you will but look more closely you will discover on every hand abundant proofs that under the present order thousands upon thousands of men are constantly being made rich by legislative protection or connivance, and that among the direct beneficiaries of this legislative wealth-making are yourselves.

And now, finally, how can you keep your way, month by month, mouthing the phrases inspired in you by your masters, and forgetful of your obligations to those who toil? Do you never feel a consciousness of ingratitude when you think upon those by whose patient striving you are fed? Does an inner voice never speak to you of your subservience? Do you never start and draw back, if only for a moment, from your forced labor of mending your phrases, year by year, to make them accord more nearly with the newer needs of your masters? When, ten or twenty years ago, you preached unrestricted competition because that was the thing your masters demanded, you did not divine that among their needs today would be a moral and economic sanction for the limiting of competition, as in trusts and companies. Did you, when it came to making the shift, make it freely and gladly, without a qualm, or did you palter and hesitate, as one who would avoid an enforced duty?

And do you never grow tired with it all, and look upon it as a burden from which you would be free? Is it an always pleasant lot to be doing only that which your masters desire of you? Do

you recall Rossetti's "Jenny," and the question he asks of her and answers in the same breath:

"For sometimes, were the truth confessed,
You're thankful for a little rest,—
Glad from the crush to rest within,
From the heart-sickness and the din,
* * * * * * *
From shame and shame's outbraving, too,
Is rest not sometimes sweet to you?"

Do you not sometimes tire of it all, and look out wistfully into that larger communion of life where service is not a meretricious and degraded pandering to the privilege and luxury of a few, but a rendering of good to the human race? Do you not recognize that in the purposes of the master class, in so far as it takes any notice of you at all, you are but as the pathetic little Jenny in the hands of her master:

"Who, having used you at [its] will,
Thrusts you aside, as when I dine,
I serve the dishes and the wine."

Do you not sometimes wish to break clean from it all, and to merge yourselves in that universal movement that makes straight for the goal of human emancipation? There is room for you when you shall have awakened to your better selves.

New York City.

Myths of American History

BY H. J. HASKELL

Editorial Writer of the Kansas City Star.

WHEN Sainte-Beuve remarked that history was merely an accepted fable, there was a large element of truth in the witty exaggeration. Historians were disposed to accept all the statements of their predecessors without investigation. If some writer with a vivid imagination happened to say that Europe was in a panic in the year 1000 over the approaching end of the world, his assertion was unhesitatingly copied by his successors, even tho there was no contemporary evidence of its truth.

But in recent years all this has changed. A story is no longer credited simply because of its frequent repetition. Careful investigators have been challenging statements, sifting evidence and weighing probabilities. In no field have their results been more striking than in that of American history. In some instances their labor has been apparently destructive, as in revealing the duplicity of President Polk in instigating a war of spoliation. In others it has been a work of rehabilitation, as in probably clearing Aaron Burr of the charge of treason. Occasionally mere details have been corrected, as in the demonstration that the West Indian island on which Columbus first landed could not have been the present San Salvador. Again, important errors in the viewpoint have been set right, as in the proof that the Revolution was not the result of conscious tyranny and oppression on the part of the British Government.

In this scrap-heap of cast-off material are legends that have an important part in American life, or that at least enter into the mental make-up of the average man or woman. For instance, on December 22 New Englanders celebrate as Forefathers' Day the supposed anniversary of the landing of the Pilgrims on Plymouth Rock. Yet there happens to be no record of what the "Mayflower's" passengers were doing on December 22, 1620. The real anniversary is December 21—December 11, Old Style. The error arose in transposing the date from Old to New Style.

But there was no "landing" in the popular acceptance of the term even on December 11-21. The Pilgrims first trod the land of the New World on the shore of Provincetown Harbor in November. Later an exploring expedition was sent out in a small boat, while the "Mayflower" remained at anchor off the end of Cape Cod. On Monday, December 11-21, this party, William Bradford's quaint chronicle says, "sounded ye harbor and

founde it fitt for shipping; and marched into ye land, & found diverse cornfeilds, & little runing brooks, a place (as they supposed) fitt for situation; at least it was ye best they could find." The "Mayflower" herself did not anchor in Plymouth Harbor until December 16-26, and the last of the passengers did not leave the ship until the end of March.

Bradford says nothing of the famous "rock" as the landing place. The established belief rests on the testimony of two aged persons who died early in the last century. They agreed that in 1741, when a wharf was about to be built at Plymouth, old Elder Faunce, then ninety-one years old, had come down to remonstrate against exposing the rock to injury, because he had been assured in his boyhood by the first settlers that it was the "Mayflower's" landing place. Such a tradition would afford doubtful proof of a matter of importance. Since only sentiment is involved it may, perhaps, pass muster.

Most persons probably still have a vague impression that the old stone tower at Newport, R. I., is a relic of the Northmen's voyages to Vinland a thousand years ago, as explained by Longfellow's "Skeleton in Armor":

> There for my lady's bower
> Built I the lofty tower
> Which, to this very hour,
> Stands looking seaward.

But it was long ago demonstrated that this is the shell of Governor Arnold's "stone-built windmill," mentioned in the Governor's will late in the seventeenth century, and that it was probably modeled after a famous mill in Warwickshire, the county from which the Arnolds emigrated.

An even more prevalent belief is that the artificial mounds scattered over the United States were constructed by a mysterious, pre-historic civilized race which occupied the continent before the advent of the Indians. Modern investigation has substituted for this romantic theory the commonplace idea that the mounds were the work of Indians, and that the stage of culture revealed by the excavated relics is about that of the Cherokees, Choctaws and Seminoles.

Prescott has made famous the "Empire of Montezuma" and its capital, the "far-famed Venice of the Aztecs." Unhappily for romance, the "empire" has faded into a confederacy of Indian tribes, Montezuma has become an elected war chief, his "palace" an Indian communal house, and the glittering "Venice of the Aztecs" an overgrown adobe village.

Historical research is not, however, merely iconoclastic, and an admirable illustration of its constructive tendencies is afforded by Prof. E. G. Bourne's recent rehabilitation of Spanish rule in colonial America. He has pointed out that, contrary to the popular impression, the Spaniards seriously undertook the task of civilizing the Indians, that for this end they established numerous manual training schools, and that their institutions of learning, both in numbers and in standards, outranked those of English America until the nineteenth century. His comparison of the English and Spanish systems of dealing with the Indians leaves no warrant for self-righteousness on the part of the English-speaking peoples.

A curious instance of the survival of a false impression is the connection of Connecticut with the "blue laws," tho its legislation in colonial times was no bluer than that of the other Puritan colonies. The legend arose thru the publication in London in 1781 of a "General History of Connecticut" by the Rev. Samuel Peters, containing what purported to be the colony's code of laws. This code, which included the famous injunction that "no woman shall kiss her child on the Sabbath or fasting-day," has been proved to be Mr. Peters's own invention.

It was long supposed that Braddock was ambushed by the French and Indians in his campaign against Fort Duquesne in 1755. A more careful examination of the documents has cleared the veteran of Fontenoy — and incidentally Major George Washington of his staff—of guilt of such a blunder. The wagons and artillery were advancing along the road, while the soldiers marched thru the forest on either side with a screen of white and Indian scouts. The battle was an ordinary frontier forest engagement in which the British were flanked and driven in toward the road. Braddock's great and fatal mistake was his refusal to allow his regulars to follow the ex-

ample of the Virginians and fight from behind cover.

Among the numerous misconceptions regarding the Revolution, a striking one concerns the outcome of the failure of the powder supply at Bunker Hill. The lack of powder is generally supposed to have caused the American defeat. On the contrary, as Charles Francis Adams has pointed out, it proved the patriots' salvation. The fortification of Breed's Hill, without provision for the defense of Charlestown neck, was a strategic blunder that should have proved fatal. The British had only to land on the neck under the guns of the fleet to cut off the Americans and starve them out. This course Clinton advocated, but his advice was fortunately ignored by the admirably stupid Gage, who insisted on a frontal attack on the fortifications. Had the Colonials' powder held out and the third attack of the British been repulsed, the Royalists would doubtless have adopted Clinton's plan the next day and have bagged the entire American garrison. As it turned out, the patriot troops were able to flee across the neck to safety.

The treason of Benedict Arnold is, of course, familiar. But probably comparatively few persons know that General Charles Lee, at one time second in command to Washington, was a traitor. The evidence of his treachery was found eighty years after the event in Sutton House, England, whither it had been carried by Lord Howe's private secretary. The document is a plan of campaign drawn up for Howe in Lee's handwriting, and pledging him "sincerely and zealously" to enter into the British cause. His plans miscarried, however, and while his contemporaries suspected his good faith they never found him out.

A legend about Washington that first appeared about sixty years ago has gained a wide currency and still persists, altho it was discredited by Moncure D. Conway in an essay published in 1889. The story is that Frederick the Great sent a sword to Washington with the inscription "From the Oldest General in Europe to the Greatest General on Earth." No sword from Frederick is mentioned in Washington's will, tho the document disposes of all his swords, and the weapon which recent tradition has fixed on bears no inscription. It is almost certainly the gift of a German, Theophilus Alte, who sent it to Washington in 1795. A foundation for the legend appears in a stray item in the *New Jersey Journal* of August 9th, 1780, which says that Frederick had recently sent His Excellency, General Washington, a portrait of His Majesty, with the inscription which later rumor ascribed to the sword. There is no further trace of this portrait, and the item was probably an invention. What makes it practically certain that Frederick never sent any such laudatory message to Washington is the fact that only once in his voluminous writings does he even mention the American commander's name. In his memoirs he merely remarks that "General Washington, who was called at London chief of the rebels, gained at the commencement of hostilities some advantages over the Royalists who were assembled near Boston." Had Frederick regarded Washington as "the greatest general on earth" it is hardly conceivable that he would have concealed his opinion so carefully.

Incidentally, the reasons for discrediting the cherry tree story are not widely known, and it has even been suggested recently that Washington's failure to denounce the legend proves its credibility. The fact is that Washington had no opportunity to pass on the story. The first edition of Weems's "Life" did not appear until two months after Washington's death, and it contained no anecdotes of his boyhood. The author was apparently encouraged by the success of his volume to improve on it. In the fifth edition, printed in 1806, he first cites verbatim the classic conversation: "I can't tell a lie, pa; you know I can't tell a lie. I did cut it with my little hatchet." The fact that one of Weems's stories of his hero has been found to be copied bodily from Dr. Beattie's sketch of his son published in England in 1799, would discredit the collection of anecdotes, were there no other reason for rejecting them.

Modern research has dealt more kindly with the character of Aaron Burr than with that of most other conventional villains of history. If Professor W. F. McCaleb has not absolutely cleared Burr of the charge of treasonable designs

against the integrity of the Union, he has at least cast such doubt on the point that it can no longer be affirmed with assurance. It is undeniable that Burr made treasonable proposals to Merry and Yrugo, the British and Spanish Ministers. Professor McCaleb, however, produces much evidence to prove that these were merely a blind for securing money from the British and Spanish Governments in order to carry out his real plan for establishing himself at the head of a Mexican empire.

His contemporaries' belief in his treason was chiefly due to the statements emanating from the mendacious General Wilkinson, at one time his associate, who later had a personal motive for discrediting him. The brilliant grandson of Jonathan Edwards was not an admirable character, but he was probably not the traitor his enemies painted.

In connection with Burr it may be noted that the simplicity of life attributed to his great antagonist, Jefferson, was largely legendary. Jefferson's account books show that in his first year as President he spent $25,263—and that, too, at a time when the President's salary of $25,000 was probably equivalent to the $50,000 now paid. He preferred to ride horseback in Washington, where the streets were bad, but at one time he owned a coach and four that cost him $1,600, and his coachman and footman wore livery. He kept eleven servants in the White House; his wine bill for a year was $1,300, and a Federalist Congressman once wrote that he "wished the President's French politics were as good as his French wines."

Another striking illustration of how legendary material can find its way into contemporary history is afforded by the myth of Marcus Whitman's "saving" of Oregon. The story, as it has been incorporated into numerous histories, is briefly this: For many years Great Britain and the United States had disputed the title to the Oregon country lying between Russian America on the north and Mexican California on the south. In October, 1842, Marcus Whitman, a missionary of the American Board to the Indians, happened to learn, while at Fort Walla Walla, that Congress was about to surrender the American claims, in ignorance of the disputed country's value, in return for certain fishing rights. He, thereupon, started on a winter journey over the mountains for Washington, where he arrived on March 2, 1843, persuaded the Administration to put off negotiations for the surrender of Oregon, and offered to lead a thousand settlers thither.

So much for the legend. Professor Bourne has shown by contemporary records that what Whitman really crossed the mountains for was to dissuade the Prudential Committee of the American Board from its decision to abandon one of the Oregon mission stations. True, he went to Washington, as well as to Boston, but there is no indication that he exerted any influence on Congress, for the surrender of Oregon was not then contemplated. A month before his arrival the Senate had passed the Linn bill to extend United States laws over the territory. Contemporary newspapers barely mention his visit to the East, and know nothing of his legendary mission. He did accompany a large band of emigrants to Oregon that autumn, but his only interest in the expedition, according to the records of the American Board, was to induce "a small company of intelligent and pious laymen to settle at or near the mission station."

The mythical account of the missionary's purpose was invented about twenty years later by his colleague, H. H. Spalding, who had been left a nervous wreck by the Indian massacre of 1847, in which both Whitman and his wife perished. Spalding's apparent object was to elicit sympathy for the cause of Protestant missions in a bitter controversy with Catholics in which he had become involved. It is charitable to assume that with the efflux of years his memory had become confused.

While public sentiment has always been divided regarding the justice of the Mexican War, until recently accounts of its origin were based on President Polk's message to Congress, announcing that "War exists, and notwithstanding all our efforts to avoid it, exists by the act of Mexico itself." It was consequently assumed that the war message was instigated by the news of the attack on Gen-

eral Taylor's force on the Rio Grande. The recovery of Polk's diary by George Bancroft a few years ago revealed the hollowness of the President's assertions.

In September, 1845, Polk notes that he expects not only to annex Texas, but also to purchase New Mexico and Upper California from Mexico. His commissioner to Mexico, Slidell, returned, however, without accomplishing the purchase, and on Saturday, May 9, 1846, the exasperated President writes that he assured the Cabinet of his intention to send a war message to Congress on the next Monday. At this time no word had been received from Taylor, and Bancroft, then Secretary of the Navy, urged that the President wait for some overt act of aggression by Mexico. Polk refused the advice, but the same afternoon Taylor's report of the first skirmish came, another Cabinet meeting was called, and it was determined to base the appeal to Congress on the news from Texas.

Accordingly, the President worked all day Sunday on the message. His double-dealing did not distress him, but he piously observes: "I regretted the necessity for me to spend the Sabbath in the manner I have." The real purpose of the war—the dismemberment of Mexico—is emphasized in another diary entry a few days later. To put a better face on the conflict before the world, Buchanan, then Secretary of State, had prepared a circular letter to be sent abroad, disclaiming any intention of seizing Mexican territory. Polk had this suppressed. "I will not tie up my hands," he writes, "by any such pledge. In making peace with our adversary we shall acquire California and New Mexico and other further territory as an indemnity for this war, if we can."

Another curious revelation of the diary and correspondence is that the President made an agreement with Santa Anna, then an exile in Havana, by which the United States Government was to allow the Mexican leader to return home on condition that he use his influence to secure the cession of the coveted territory to the United States. Santa Anna returned, but was ungrateful enough to fight for his country and repudiate his compact.

Whether Jefferson was frugal or extravagant, whether Burr was a traitor or a filibuster, whether Whitman saved Oregon or not, are, of course, questions of comparatively minor importance. But a real transformation of American history has come in recent years in the new point of view by which the discovery of the continent is regarded, not as one man's isolated achievement, but as an incident in the expansion of European commerce; colonial development not as an independent movement, but as the growth and unification of "outlying portions of the British Empire," and the welding of the nation not as suddenly accomplished by the adoption of the Constitution, but as a slow evolution largely determined by economic considerations. These are the fundamental changes that have made American history no longer Sainte-Beuve's *"fable convenue."*

Kansas City, Mo.

A Processional

BY HENRY AUSTIN

In Shelburne village is a birch-clad knoll,
With here and there an over-topping pine,
Whereon a summer cottage hath been reared
To home the Whitest Art, and keep the soul
In tune with Nature and with human love.
Pavilioned calm, under the friendly frown
Of Bald Cap, a dwarf mountain, or a hill
Aspiring heavenward, sometimes one may see,
When August noons have kindled up the air—
Oh rare and strange and precious privilege,
Oh Vision of wonder and supernal power!—
A proud processional of mountain storms.

It is a rapture unto few vouchsafed;
Ne'er to be rivalled; ne'er to be forgot.
From the bland brow of soaring Madison

Adown the undulous valley, following slow
By rhythmic lure the labyrinthine charms,
The serpentine meanders beautiful
Of silver Androscoggin, they descend,
Majestical of motion.

Mark that speck,
Dark, leadlike, on the vast, sky-holding head
Of Washington, far over to the left!
Benignly on his comrade Presidents
He smiles. His glorious countenance is blue;
Is bluer than the heavens that bend to him.
But yonder leaden lump, albeit so small,
Catches, and clings, upon the wistful eye.
For soul of symbolist 'twould easy be
To fancy this an image of his dread
Of what might happen in the days afar,
If the great land that he so greatly loved,
The pure republic 'stablished by his life,
Should e'er become for vulgar Money-Kings
A chessboard—and the people merely pawns!

Away with ugly fantasies like this!
Tho on the smoothness of that lofty brow
The shadow gathers; gathers rapidly;
Goes rolling down, and on toward Madison.
A breath ago—'twas just a little cloud,
No bigger than a hand; while now, behold!
It is a purple mountain, pendulous
In air; and striving—with a half success—
Madison to eclipse and all the vale
To overshadow; all the lovely vale
That far below exposes, fast asleep,
Her breasts of beauty in a dream of Peace.

But presently this purple pendulous
Mountain refrains from its endeavor vain
To shake with transient show of evil power
The placid heart of steadfast Madison;
And seems to change its visage grim and fierce
Into the likeness of a giant roc,
That magic monster-bird of Orient myth!

Anon, more dreadful still, belike some shape
Unspeakable—unpicturable—shape
Utter in formlessness and force, compound
Of bird and snake (the which held lurid reign
And revel red in chaos ere the Flood)
This huge of purple vapor plunges down,
Down on the pallid valley; the gray vale
Awake now, widely, with expectance keened;
And keyed to Agony's defiant pitch
In every quivering tree, and shivering blade
Of wavy grass, and every gypsy weed
That hopes to be transfigured to a flower!

With what a flush of speed this towering storm
Has gathered; but—it pauses, ere it swoops;
Just for a single moment dense and tense,
It pauses with a feint of hesitance,
As if in sense and relish of its power.

So far, no sound hath risen; tho yon high elm,
Most curiously shapen like a harp,
Seems almost pulsing into piercing notes,
Funereal runes Druidic. Still, as yet,
There is no sound—only an awestruck stir—
A palpitant shrinking from the coming crash!
It comes!

One long, low, strong, melodious roll
Swells, echoing, in a chain from hill to hill;
And now, a flash of lightning, molten-gold,
Links, for one eye-blink, dazzling ere it dies,
The purple, pendulous, looming mount of cloud
And the startled river, mailed in steely sheen.
Then changes form again this wondrous cloud.
Its bird-shape vanishes; and it becomes
A floating fort, on bastion bastion piled,
Rampart on rampart rising!

Oh! the roar,
The steady roar of this artillery
From soaring battlements of purplish black
Confounds the shadowy confusion; drowns
The petty rumble of the railway train
That snakes along the valley; turns that voice
Of man's most potent enginery of peace
Into the vaguest shadow of a sound
And makes his cannon pyrotechnic toys;
E'en as their trailing veils of smoke might seem
The merest puffs of breath in frosty air
Against yon floating mass of stayless cloud.

The thunders thicken, tho yet falls no rain;
Thicken in volume and in frequency;
While, stabbing here, and there, and everywhere,
The forced night of the landscape, how the gay,
Bravado lightnings, faster and more fast
In their delirium of ruthless power,
Play royal games of havoc!

Suddenly,
From the calm knoll of this pavilion safe,
A thousand feet afar from all this ramp
Of elemental passion, one beholds
That storm-cloud burst below—upon the vale
At silver Androscoggin's keenest curve.
Silver no more, the leaden-visaged stream,
As bursts the cloud, is into foam-wraiths cut
By the precipitous lunging of the rain:
Rain so continuous, there seem to be
No single drops; but just a hurling swift
And a swift hurling from the angry sky
Of diamondine javelins.

Brief the space
Of this attack! Yet, ere the river white
Hath quite recovered from its brilliant bath;
Ere e'en the echoes of the first great cloud,
So myriad-shapen, into silence faint;
Lo! treading on the first cloud's wingèd heels
Another storm comes towering down the vale
With strides yet more gigantic and with pomp
Of music vaster; close upon his heels
Another, and yet another, in such proud
Processional colossal, it might seem
Nature were striving here to realize
In visual and aural shape the dream
Of that blind poet luminous, who sang
The splendors of the angel hosts that fell
(Because too proudly did their souls aspire)
"With hideous ruin and combustion, down
To bottomless perdition; there to dwell
In adamantine chains and penal fire."

Passaic, N. J.

Present Religious Conditions in Cuba

BY WARREN A. CANDLER, D. D., LL.D.

Bishop of the Methodist Episcopal Church, South.

IT is now a little more than seven years since the Spanish-American War ended, and the authority of Spain over "the ever faithful Isle," Cuba, ceased,

Before and during that war there were some small missions of Protestant churches on the island, but anything like a general movement for the establishment of Protestantism in Cuba was not undertaken before the year 1899—the year after the war closed.

When the Protestant missionaries began their labors they found the island a land filled with religious indifference in which there was a considerable amount of down-right and out-spoken infidelity of the Voltaire type. The Roman Catholic Church, by reason of its official connection with the Spanish Government, and from other causes, had lost its hold upon the Cuban people, and no other form of Christianity had been embraced by them.

The same state of things religious continues until now, but it has been very much modified during these seven years of political freedom and Protestant evangelization.

The agents and colporteurs of the American Bible Society and the Protestant preachers have scattered among the people tens of thousands of copies of the Bible. These Bibles have not been given away, for if they had then soon would have been thrown away. Most of them have been sold to people who wished to own them and were willing to pay for them. It is now impossible to get these books out of Cuba, or to restrain the influence of them. And after all has been allowed for the theories of the distinctive criticism which can reasonably be asked, it remains indisputable that in the Bible there is a quality found which inspires and invigorates the moral life of men and nations as no other book can. This tonic influence has reached thousands of the Cuban people, and it extends daily the area of its power.

With the coming of Protestantism into Cuba has come also a new type of sacred songs. Roman Catholicism has its chants, requiems and the like, but it has no hymns of joy. These are the peculiar treasure of evangelical Christianity. They belong to the lands over which have passed those great movements of grace which for lack of a more exact word the English-speaking people call "revivals." Thousands of Cubans are now singing these songs. An incident may illustrate this matter. At the last celebration of the Cuban independence day the only songs used in the celebration held at the little town of San Juan de Los Yeros, in the Santa Clara Province, were hymns taken from the collection published by the American Tract Society in Spanish. As one passes along the streets he will not infrequently hear children and older people singing these songs. There is no way to estimate the pervasive power of these evangelical hymns. It must be candidly admitted that many of them are rather clumsy translations from the hymns of the Wesleys and Moody and Sankey; but despite their many blemishes and defects they have power with a people who have had no such hymns before. Cuba, as well as all Spanish-America, awaits the coming of its Watts, and its Charles Wesley; but when they come, as come they will in time, they will find in these Latin lands better hymns than Watts and Wesley found in England when they came singing their songs of salvation thru the eighteenth century.

A movement for a better observance of Sunday has sprung up in Cuba. Even in this great city of Havana, the political capitol and the commercial metropolis of the island, the movement has acquired such power as to secure action by the municipal authorities. The newspaper *La Lucha*, in its issue of January 19, reports that the ayuntamiento took action at its previous session ordering that all places of business be closed on Sundays,

excepting undertakers, drug stores, restaurants, cafés, fruit stores, newspaper offices, cigar stands and dairies. Bakeries, butcher shops and provision stores are allowed to remain open until 10 a. m. on Sundays. The ordinance takes effect next Sunday, and it is strongly supported, editorially, by some of the daily papers. It is a rather liberal, not to say loose Sunday-closing law, or so it seems to one accustomed to the Sunday observance found generally in the Southern States of our own country; but if it is enforced Havana will not be a more "open town" than New Orleans, Chicago or New York. This ordinance, at any rate, shows moral progress, and it will liberate many a laborer from Sunday toil.

The Protestant churches are meanwhile working and growing. Their services are well attended, because in them men preach, and the preaching of the Protestant preachers has provoked the Catholic priests also to an amount of preaching not common in their churches in former years.

But while all these signs of religious improvement are visible it is still true that Cuba is a land of religious indifference.

Recently, as I was returning from a visit to Pinar del Rio I shared my seat in the railway car with an educated Cuban gentleman. He told me he was educated at Lehigh University. Desiring to get from him his views of Cuban conditions, unbiased by any personal influence whatsoever, I did not disclose my identity to him. After asking him about social, educational and economic conditions, I inquired, "What is the state of the Church and of religion in the islands?" He replied, "The great majority of the Cuban people are indifferent to religion. Their sympathies, perhaps, are more nearly with the Protestants than with the Roman Catholics. The Protestant places of worship are generally crowded with people, while the Catholic churches have but few attendants. But the Protestant churches are few and small, and hence reach only a small per cent. of the Cuban population. I estimate that 2 per cent. of the Cuban people attend the Catholic churches and one-half of 1 per cent. the Protestant churches."

I have no way of testing the correctness of his estimate of the attendance on the Roman Catholic churches, but I am in position to know that his estimate as to the Protestant services is approximately correct, and my observation of the number of worshipers I saw in the Catholic churches I have visited agrees with his calculation.

If his figures are approximately correct, then more than 95 per cent. of the Cubans do not habitually attend any Church. Such a state of things religious bodes no good for the young republic. Godless republics, in the very nature of things, can not be stable.

Herein also is an appeal to the zeal of the American churches. It has been demonstrated that the Cubans are ready to attend Protestant churches—at least that multitudes of them will. But there are not enough Protestant places of worship on the island to meet the demands of the situation. The Methodist Mission is said to be the strongest of all the Protestant missions. It has 27 churches with about 2,000 members and 1,300 candidates for membership awaiting further examination and instruction. As the bishop in charge of the mission I have been entreated to open work in many places not now occupied, but I have not had men or money sufficient to respond to these appeals. I dare say those in charge of the Cuban missions of other Protestant denominations have had similar experience.

We will not have done our duty by Cuba if we stop with merely freeing her from the domination of Spain. We must help to create and maintain the religious life without which civil freedom cannot long survive, nor attain its best form while it lasts. Our debt of compassion and brotherly kindness will not have been fully discharged until we have done what we can to bring this mass of religious indifference into obedience to the faith that is in Christ Jesus our Lord.

HAVANA, CUBA.

Literature

A Long Distance View of Municipal Ownership in Great Britain

THE object of Mr. Hugo R. Meyer's book* is to show how deplorably belated is Great Britain with regard to street car traction and electric lighting in comparison with the United States; to condemn all who have been directly or indirectly connected with municipal ownership in England; and to glorify company control of public utilities as it exists in American cities. But it is so obviously a long-distance view that a reading of Mr. Meyer's book suggests that he has never been in England or Scotland, and that he has worked up his subject in one of the three great libraries in this country which are famous for the completeness of their collections of British Parliamentary reports.

These reports are numerously cited by Mr. Meyer. They are cited in such a way as to give an air of authority to what he writes. It is, however, only necessary to note the blunders which he makes in so comparatively simple a matter as the topography of London to realize that he is writing on a subject of which he has little first-hand knowledge. He does not spell correctly such well-known London names as Walsingham House (Piccadilly), Hornsey or Hendon; and he surely has got out of his depth when he lambasts the old Metropolitan Board of Works and the Corporation of the City of London for not admitting street cars into the City and into the congested parts of central London, over which the Metropolitan Board of Works—since 1889 superseded by the London County Council—exercised control. In reading these pages one is compelled to ask: "Was Mr. Meyer ever in Chancery Lane or Fetter Lane during the busy hours of the day; or did he ever stand for five minutes near the Bank of England?" Mr. Meyer writes as an authority on municipal engineering; but it would surely exhaust his stock of experience to devise a plan by which the Aldersgate and Moorgate street cars could be continued from their present termini into the City, past the Bank to London Bridge. Fetter Lane and Chancery Lane are the only thorofares by which Fleet street or the Strand can be reached from the Holborn end of Gray's Inn Road, the present terminus of the North London street car systems. Both these old London lanes are too narrow and too crowded to admit of even a single line of street car track. They are about as available for street car tracks as Maiden Lane, New York. Yet it is because there are no street cars in the older and more congested parts of the City and of central London that Mr. Meyer holds up to ridicule both the old Metropolitan Board of Works and the City Corporation, which has its headquarters at the Guildhall.

According to his presentation of the case, almost every man who has been in municipal politics in England since 1870 —when the Tramways Act was passed— and every man who has been in Parliament during these thirty-six years, has been either a fool or a blockhead, and for the sake of obstructing progress has stood in the way of company promoted enterprise. He overlooks the fact that one-third of the municipal councillors in an English city are elected every year; that each municipal council appoints its own representatives to the Association of Municipal Corporations; that general elections to Parliament come on an average once in five years; and that the President of the Board of Trade, the state department responsible for the oversight of most public utilities, is amenable to the control of the House of Commons.

According to Mr. Meyer, public opinion in England must count for nothing. He does not even give the people of England credit for knowing what they want in regard to public utilities or understanding how to get it. Nevertheless, they have long known what they want;

* MUNICIPAL OWNERSHIP IN GREAT BRITAIN. *By Hugo Richard Meyer.* New York: The Macmillan Co. Pp. xii, 340. $1.50.

and, generally speaking, they have secured what they wanted. The English people, nearly forty years ago, made up their minds that there should be as little company control of public utilities as was possible; and if Mr. Meyer had paid less heed to the expert testimony that has been given before select committees of the House of Commons by company promoters' witnesses, and moved about a little among people in England, he would have ascertained that, altho the United States may have more miles of street car lines than Great Britain, and more central stations for the distribution of electricity, English people are quite satisfied with their policy and progress, and would resent the counsel inferentially offered by Mr. Meyer that they should exalt "the man of affairs" above the Municipality and the State.

In England the "man of affairs" in all matters concerning public utilities is known as the company promoter and the exploiter. English people are familiar with him, and it has long been the policy of municipal corporations, without regard to politics, to keep the company promoter and the exploiter of public utilities at a safe distance. At times a little loss or a little delay may result from this cautious policy. Still, caution is as characteristic of industry in England as it is of the attitude of English people toward new inventions appertaining to public utilities; and if England is behind the United States as regards street car mileage and central electrical distribution stations, there is very little graft in English municipal life, and municipal government is not the disturbing problem it has been in the great cities of this country since the public utilities began to attract the attention of scheming financiers and promoters.

It has been remarked that Mr. Meyer shows himself ignorant of English municipal history. All that need be cited in proof of this is his reiterated statement that British municipalities have originated nothing in water supply. Has Mr. Meyer—sometime Assistant Professor of Political Economy in the University of Chicago—never heard of Loch Katrine, Thirlmere, Vyrnwy, and Elan and Claerwen, the sources from which Glasgow, Manchester, Liverpool and Birmingham obtain their water supplies? Apparently not; and perhaps for the reason that the little group of English financiers who worked for the appointment of the select committee on municipal trading, and then saw the collapse of their scheme for heading off municipal ownership, have never regarded water as a public utility within their purview—as a utility which nowadays could be exploited by company promoters—and consequently they have put out no literature in opposition to the ownership of water supplies by the municipal corporations.

Society in the Days of the Grand Monarch

An exquisite specimen of the salon of the eighteenth century has been preserved for us in inimitable fashion by Janet Aldis in *Madame Geoffrin and her Times, 1750-1777.*[1] This famous *salonière* was *une vraie bourgeoise,* the daughter of a one time *valet de chambre* of the Dauphine. She was born in 1699, and fourteen years later was sold by her grandmother to M. Geoffrin, a prosperous general cashier of a mirror manufactory, whose heyday of youth, if he ever had one, was passed, for he was in his forty-ninth year. For a long period she was a patient, faithful housewife—so absorbed in the personality of her money making husband that the lawyer Blackstone would have been delighted with her. At the age of thirty she experienced a rude awakening on her own account: she fell in with the notorious Marquise de Tencin, a relic of the vicious days of the Regency, ruined in fortune, but still reputable, tho in her youth she had been imprisoned on the charge of murdering her lover. The Marquise was attracted by Madame Geoffrin and invited her to her house, where met some of the most famous literary men of her day. Madame Geoffrin's quiet and unassertive virtue was both a curiosity and a charm to many who frequented the salon of the Marquise, and in time she opened a salon of her own in a small way, quite to the disturbance of the money loving husband, who yielded

[1] Madame Geoffrin; Her Salon and Her Times. 1750-1777. *By Janet Aldis.* New York: G. P. Putnam's Sons. $2.75.

meekly to his wife's ambitions and betook himself to the management of the dinners in order to cut down expenses. M. Geoffrin sat regularly at the head of the table crowded with guests until 1750. In that year he disappeared, and when some one asked the madame what had become of the old gentleman who sat so long with them, but never spoke, she replied: "I know whom you mean. It was my husband. He is dead."

Now the Madame Geoffrin was at the same time helped on her upward course by the death of the Marquise, to whose social and literary lights she fell heiress. For twenty-seven years she had apparently smooth sailing; doubtless there were moments of anguish in the beginning when some invited lion came so late that his coming was despaired of, but this period was soon passed, for the madame so far triumphed in her chosen art that it was indeed a huge lion who could dare to pass her by.

Launched on the full tide of her story, our author sweeps us along with irresistible charm. In the salon of the madame in Rue St. Honoré we are introduced to the wit, philosophy and esthetics of that wonderful age—the eve of the Revolution. Scarcely a mighty figure escapes us. The dried up Fontenelle shoots his epigrammatic wit at us and maintains a placid and cynical sweet reasonableness that reminds us of Arnold Daly. Voltaire, the uncharacterizable, comes, but he is not happy with the madame, whose illiteracy he makes the subject of a sharp turn. Madame de Pompadour is charmed with Madame Geoffrin's daughter, and thru this curious channel we catch glimpses of the glorious court which Burke raves about in his "Reflections on the French Revolution." Now we meet the encyclopedists, the uncouth but incomparable Denis Diderot, fiercely aglow with wrath and enthusiasm; now the calm and dignified Montesquieu, whose ponderous work on the "Spirit of Laws," the madame can no more appreciate than her butcher can; now comes D'Alembert, cool and light of temperament; Grimm, the astute German literary jackal; Abbé Raynal, Hume, Horace Walpole, Joseph of Austria and all the rest crowding in upon us with irresistible charm. We are positively sorry when the madame finally dies and the crowd rushes to some new limelight seekers and forgets her cold ashes.

We are fortunate, however, as we lay down Madame Geoffrin to have another handsomely illustrated memoir, quite different in style and content, but nevertheless with distinctive interest for one who never tires of the age of the Grand Monarch. Arvède Barine, in his *Louis XIV and la Grande Mademoiselle*[2] (1625-1693), endeavors to give us an intimate acquaintance with the King, and with his age, so far as it is reflected in the higher social circles. He protests against the impression given by the scathing memoirs of St. Simon and also against that view of Louis which makes him the man for whose favor Molière and the Libertines fought with varying chances of success. The outcome of our author's enterprise is hard to characterize. Its chief fault seems to be that it is neither successful history nor charming light gossip. If we want to know about Mazarin, Colbert, Louvois we will not turn to Barine, but to Cheruél, Clement and Lavisse. Those, however, who delight in feudal ideals, futile discussions on whether an accepted lover is more unhappy than a rejected lover in the absence of his beloved, and in selected dainties from court scandals and chat, will find this volume entertaining and readable. Perhaps the spirit of the age —if anybody knows what that is—will be found better here than in Cheruél's seven volume "Histoire de France sous le Ministère de Mazarin," or Isambert's "Recueil Général des Anciennes Lois!"

Les Cartes à Jouer du 14e au 20e Siècle. Par Henry René D'Allemagne, Paris: Hachette et Cie. 2 vols. 60f.

The splendid volumes on the history of playing cards that M. D'Allemagne has given us are notable in more than one respect. They constitute an exhaustive study, and will always remain as monuments to the author's intelligent persistency in research. The treatment of the facts regarding the origin of playing cards and the widespread esteem in

[2] Louis XIV and La Grande Mademoiselle. (1562-1693.) *By Arvède Barine.* New York: G. P. Putnam's Sons. $3.00.

which they have been held from their earliest use among many nations until the present time, as well as everything else about the book, is in a style characteristically French and very artistic. William Andrew Chatto, William Hughes Willshire, our own Mrs. John King Van Rensselaer and more than two hundred other writers in their various historical sketches of playing cards have paved the way for the present admirable treatise. In the D'Allemagne book consideration is first given to the Oriental origin of playing cards, in China and Hindustan. This is followed by some account of the early use of "The Devil's Picture Books," as our Puritan ancestors loved to call them, in France, Germany, Italy and Spain. The game of Tarots, with its quaint symbolism, which incidentally accounts for the origin of the "unlucky thirteen," is the subject of an important chapter, copiously illustrated. By means of the present author's studies in connection with this book, the old theory that playing cards originated in 1392 in order that the melancholy of Charles VI. of France might be diverted and overcome, is entirely discredited. He has found from the account books of certain Belgian princes, whom he names, that playing cards were in use at the much earlier date of 1379. Some space is given to the early German playing cards, from which Gutenberg derived his earliest inspiration as a block printer, and at least one such card Gutenberg subsequently printed. That playing cards are so various, so interesting and so heavily charged with folk lore and the artistic interest, as the D'Allemagne book demonstrates, will surprise many persons who have not given the subject consideration.

Historical personages appearing upon a deck of French playing cards, in the print department of the Bibliotheque Nationale, Paris. Reproduced from D'Allemagne's "Les Cartes," etc.

Ancient Records of Egypt. Historical Documents, from the Earliest Times to the Persian Conquest, collected, edited and translated with commentary by James Henry Breasted, Ph. D. Vol. III. The Nineteenth Dynasty. 8vo, pp. xxviii, 279. The University of Chicago Press. $3.00.

We have previously noticed Professor Breasted's "History of Egypt" and the two first volumes of this series of *Ancient Records*. This volume is devoted wholly to the flowering period of the Nineteenth Dynasty, and the next volume will carry the monumental story thru the Twenty-sixth Dynasty, including thus the two biblical Kings of Egypt, Necho and Hophra, which will conclude this series. This gives to the English reader for the first time the historical sources for his knowledge at first hand of the history of the oldest of nations, and it is greatly to the honor of the University of Chicago that it has accomplished this work. With it are to be mentioned the two parallel series of historical documents, one of Babylonia and Assyria, and the other of Palestine, Phenicia and Syria, to be given us by the scholars of the same University.

Napoleon's Notes on English History. By Henry Foljambe Hall. New York: E. P. Dutton & Co. $3.00.

In spite of his unquestioned greed for power, his cant, terrible wrongs to France, and his duplicity, Napoleon will ever remain a hero to the simple-minded. The intolerable panegyrics of Abbott will doubtless remain history for those who have no capacity for the temperate and scholarly works of Sloane and Rose; for a thousand generations of Frenchmen doubtless will be found to shout themselves hoarse over *L'Aiglon*. While this remains true, the lightest word about Bonaparte or the slightest and most inconsequential shred of his own writings will find enthusiastic copiers, hopeful publishers and many readers. The latest addition to the English stock of information is a translation of Napoleon's English history note books made while he was yet a youth. The notes from the Norman Conquest to the Revolution of 1688 are printed *in extenso* and fill about eighty pages. The centuries beyond the advent of William the Conqueror are dismissed by a cursory review. The chief interest in these notes is the fact that they are extremely commonplace and throw little or no light on the character of Napoleon as a youth. Indeed, they constitute an arid chronicle such as might be made today by any schoolboy preparing for college entrance examinations. Nowhere are they illuminated by any of that prodigious precocity which hero-worshippers like to find. There are, however, some entertaining passages, especially the youthful Bonaparte's opinion of Oliver Cromwell:

"Cromwell was in early days a libertine; religion took possession of him and he became a prophet. Courageous, clever, deceitful, dissimulating, his early principles of lofty republicanism yielded to the devouring flames of his ambition, and having tasted the sweets of power he aspired to the pleasure of reigning alone. He possessed a strong constitution and had manly but brusque manners. From the most austere religious functions he passed to the most frivolous amusements and made himself ridiculous by his buffoonery. He was naturally just and temperate."

Historic Illinois. The Romance of Earlier Days. By Randall Parrish. Illustrated. Chicago: A. C. McClurg & Co. $2.50.

The striking and picturesque incidents of the early days of Illinois are admirably portrayed in this book. Indians, trappers, explorers and settlers crowd its pages, and live over again the stirring times when an empire was in the making. It is not a history, but rather a series of historic pictures. Its matter is drawn from many sources. "Every known writer on Illinois history has been consulted," says the author, and there is no reason to doubt the claim. The abundance of material, covering so wide a field, could have been gathered only by a patient search in many quarters. While the style is popular, there is no sacrifice to the demands of romance, and it is evident that extreme care has been taken in verifying all statements of fact. It would be difficult to find a picture of pioneer days at once so true to the spirit of the time and so accurate in detail.

The City, a Poem-Drama, and Other Poems. By Arthur Upson. New York. The Macmillan Co. $1.00.

In the "Octaves in an Oxford Garden," which forms the second part of this volume, there is a vein of pure, if

not very rich or vigorous, poetry. Mr. Upson seems to be rather remarkable among the younger poets for having retained something of the traditional moral sentiment for the past. It looks very much as tho the historical sense, by re-immersing us, as it were, in this or that particular period or age, had to some extent shut off those larger prospects and perspectives which our very distance and detachment once allowed us, at the expense, of course, of much exact detail and definition. At all events there is noticeable in Mr. Upson's verse a feeling for the transitoriness of life, inspired by contemplation of the passage of time, which is becoming ever rarer and which our poetry can hardly afford to lose.

Literary Notes

A PRETTY pocket volume in green lambskin, entitled *Anthology of French Poetry,* contains short poems in the original from Froissart to the beginning of the present century. (Macmillan, 60 cents.)

....Church building committees will find much valuable information in Kidder's *Churches and Chapels,* published by W. T. Comstock, New York. It contains two hundred illustrations of successful church buildings in America, of both ritualistic and non-ritualistic forms of service, with ground plans and very practical advice on what is wanted and how to get it.

....Since we have no good American annual, it is fortunate that the new London *Statesman's Year-Book* (Macmillan, $3.00) devotes 225 pages to the United States and its dependencies. The *Year-Book* for 1906 is just out, including the latest data from all countries up to January, and is the most comprehensive and reliable compendium of statistics of the world available in English.

....*The Journalist,* a magazine for all who read and write," will be issued about July 1st as a continuation of *The Journalist,* which has been published weekly since March 22, 1884. The new magazine will contain much in the way of departments, including one devoted to advertising. Special attention will be given to fiction, and prizes will be offered from time to time for the best short stories on specified subjects. Allan Forman and Arthur E. Harrell will be in editorial control.

Pebbles

JOHNNY went to see the Stock Yards;
Mother missed him in the jam;
Johnny fell into the discard,
And came home as potted ham.
—*Puck.*

IF the muck-rake did not exist, it would be necessary to invent it.—*New York Evening Post.*

AMONG the new popular songs we note the refined ballad by G. F. Baer, entitled "Everybody Grafts but the Reading."—*Chicago News.*

ODE TO OUR COUNTRY.

(Written intermittently on July 4.)

MY country! In the solemn hush
(Pop! Pop! Popperty-bang-perlang!)
Of dawn, when from the East there rush
(Bing! Bang! BANG!)
The wide flung heralds of the morn
(Wish! Bippety! Bop!)
Proclaiming that the day is born—
(BANG! BOOMETY! BING!)
When all the world is gray and still
(Clankety-clank-clank! Bow-wow-wow!),
And silence broods upon the hill,
(Crash! Bang-bang-bang!)
'Tis then in solemn grandeur roll
(S-s-s-s-s-s-s-s-s-s-s-s-BOOM!)
Deep thoughts of thee across my soul!

My country! Ah, that lips could frame
(Whack! Bang! Boom!)
The song that rises with thy name—
(R-r-r-r-r-r-r-r-r-crack-whizz-BLING!)
When in the lulling, restful noon
(Pop! "Look out!" "Ouch!")
My feeble lyre I would attune
(Wow! WOW! Whoop!)
To some impressive melody
(Swish-sh-sh! Ka-zim-m-m-m!)
To symbolize my love for thee!
(Oom-pah, oom-pah, OOM!)
Oh, land of mine, where all are blest
(Blimmety! Bang! Boom!)
With all security and rest!

My country! When at crooning eve
(Yi-yi! Bang! Pop-pop-pop!)
The slowly creeping shadows weave
(Clang! Clang! Clang-ang-ang!)
The swathing fabric of the night
(S-s-s-s-s-s-s-s-s-s-s-s-blip! Ah-h-h!)
Illumined with pearly gems of light,
(Cr-r-r-r-r-r-r-r-r-ROOM!)
'Tis then my heart is moved to pay
(FI-er! FI-er! FI-ER!)
This homage to thy natal day.
(Ba-loom! Ba-ling! Ba-LANG!)
Oh, land of honey and of wine,
(BANG! BOOM! CRASH! WHOOP!)
What wondrous, soothing peace is thine!

—W. D. Nesbit, in *Chicago Tribune.*

A PLAY may be so natural that running water is used in river scenes; the details of costume may be carried out to perfection; every situation may be true to life, but there is one place in which the most realistic playwright fails: He makes the men's proposals of marriage too plain. Every married man knows he never came right out and asked his wife to marry him. He hinted at his feelings, and the first thing he knew he was accepted. But a stage hero comes right out and says: "I love you. Will you marry me?" And experienced people in the audience know very well that's not true to nature.—*Atchison Globe.*

Editorials

The Index of "The Independent"

THE semi-annual index of THE INDEPENDENT is now ready, and will be sent free to any subscriber who will notify us that he wants a copy. Of course those who return to us the twenty-six issues of the past six months with $1.50 will have the index bound with the numbers.

Crossing the Equator

ABOUT the Fourth of July we cross the line that divides the year. We have been watching the sun rise every morning farther and farther to the north, but now it will slowly recede to the south. The days are imperceptibly growing shorter. We need not mind this, so long as we are able to read the morning paper at five o'clock and need not turn on the gas for a six o'clock dinner. But by and by we begin to feel that we are being closed in upon. The glorious freedom of the year that lets us loose in the fields is steadily approaching the confinement of winter. But for the present the shortening of the days does not affect us. They are long enough, and, above all, morning is still ours—that wonderful break o' day, soft, dewy, sweet, yellow—when we live without neighbors—except God. A true countryman loves these early hours, when he can feel his selfhood, and then it is he gets that enlargement of mind, taste and aspirations that books and human company cannot give. Did you ever see anything more typical of absolute freedom than a barefoot country boy, with his dog, going after the cows at four o'clock in the morning? He is whittling a whistle into shape or blowing a shrill call through his thumbs on a blade of grass. The dew does not wet his trousers, for they are rolled up nigh to his hips. You see the cows at the distant bars waiting his coming. They have gathered from the groves and beyond the brook and are ready to be let loose for the barn. The dog alone seems to be inspired with a sense of duty, for dearly he loves to be behind a drove of cows and keep them in their proper paths. At one of our summer resorts they have a "Morning-tide School." The pupils go away, not together, but each one by himself, into the pines and the orchards at three o'clock. This is just before the birds begin to sing, and when the cows stretch themselves in the pasture. Are all these students without a teacher as they stroll here and there about the fields? We think not. One does not need a man to interpret Nature. He may as well learn the language that Nature speaks and then take his lessons direct from the Great Master. In fact, no one really knows very much about the world in any other way. These pupils of ours will by and by come together and compare notes. You will find that collegians who have been up till midnight studying books have not found out a tithe as much.

The farmer calls July the "corn month." If this delightful cereal does not grow through these days, in other words, if it be not hot enough for corn in July, the crop will be a failure. If the heat is sufficient it will measure inches every day. There are few sights richer than a field of corn just in the full pulsation of most rapid growth. It is soon over your head and becomes the most perfect hiding place in the country. Hops, too, are climbing their poles, hand over hand, and the grapes are filling with wine in the vineyards. Apples have grown heavy enough on the limb to turn over and henceforth they will hang downward. It will not be long before you must brace the limb, or it will come down with the weight. Some of the apples, with the Rostiezer and Tyson pears, are already mellowing. Is there any art finer than that which puts the blush on a summer pear or paints an Astrachan with crimson and gold?

By the end of June we have got through eating weeds—dandelions, docks, pokeweed and many more which come under the head of "greens." Even "sparrow grass" has had its month. Delicious Swiss chard takes their place, with young beets and carrots, and green peas and green corn. How we should like to have seen Harriet Martineau when that ear of green corn was placed on her plate! Taking it by both ends, she says, there was no escape from it, "we must

deliberately place it between our teeth and bite." But the delicious juice that flowed into her mouth was full compensation for any lack of table manners. If there were no other good reason why city people should have country homes it would be sufficient that they might have fresh vegetables out of their own gardens and of the most progressive type. There are men in these days, like Mr. Laxton, whose glory is in creating a more delicious vegetable. Nearly all of these extra choice products are consumed in the country.

The distinguishing feature of July is the harvest color that spreads over all the fields. Green rules through the preceding months, but when the wheat and the oats begin to ripen the valleys grow golden. Ah, what a sight it is now to drive down the valley road, mile after mile, and all the way hemmed in by great yellow fields that touch the roadside and climb up the hill slopes! The reapers are just beginning their work and the swaths lie straight in their tracks. A wise observer says, "You will note that now people begin to feel more like singing." It is a sort of thanksgiving that bubbles up from the heart. There is nothing to ask for in the harvest way after this—only one may ask for health, common sense, temperance and honesty to enjoy what Nature gives—rather a long list, after all. But midsummer is not one whit finer than it used to be in the old farm days. It is certainly interesting to see the reapers ride down the swaths, but the rustic splendor of a half dozen men, with competitive pride, sweeping the grain with long swings of the cradles—that too was very beautiful. Man power (touched with manly pride) is the most commanding power that we ever see in operation.

July puts us into the berry field. One goes up and down the red rows of red raspberries and currants with a sense that if Nature ever does a superfluous act it is in so overloading these bushes with fruit. But every one will come to use, gathered either in our baskets or by the birds or the bees. Cherries are as good for the eyes as for dessert. What possibilities hang on the limbs of that Morello! Cherry pie and cherry pudding make character as well as comfort. Nature provides fruit much more bountifully than flesh for our provision. The vegetarian who spreads her tables in July with berries, currants, cherries and with early apples and pears needs no apology for her opinions. Raspberries come very near being the crown of vegetation, only for blackberries that ripen a little later. We hold that garden to be an absurdity that does not contain a row of Cuthberts, another of Golden Queens and a third of Shaffer's Colossal. Every morning for three weeks the bushes are clothed in scarlet or purple, where the boys and the birds dine together.

It is a busy month, and what we need is more hammocks, with a capacity for lying still at noon for two hours—three would not hurt us. This is allowed already for old people, but a business man in the prime of life who should adopt such a custom would be held to be on the road to failure and wholly un-American. But it would be far more rational than racing after dogs or playing golf. What we need is regular daily and adequate recuperation. If the strenuosity of American life is not met sufficiently by the night's sleep, then a noonday siesta becomes imperative. This we write for the country as well as for the town. The old one hour "nooning," used for a swift dinner and possibly a pipe should be expanded to a real rest period, a recreation. A recent writer says that "Sunday is simply the voice of Nature calling us off duty in order that we may not be overworked." But he adds, "My Sunday begins whenever I am tired and any day in the week. I will not go beyond the danger mark. When I am tired I stop." This is the new lesson of the higher rightness, that one should remember his own Sabbath day to keep it holy. It is a crime to destroy our own lives or weaken our life power. Rest is a part of religion. Swing your hammocks and make every noon a Sabbath.

A Fruitful Session of Congress

THE first session of the Fifty-ninth Congress adjourns with a remarkable record of important legislation. Very few understand how much work our national legislators must do in perfecting and enacting the absolutely necessary measures of each year. These great ap-

propriation bills, with certain other measures that cannot be postponed, consume almost all the time of each short session. In each long one the same work cannot be avoided. We recall no other long session in which the time remaining for legislation that is not of a routine character has been so well employed as in this one that ended last Saturday night.

First and greatest of the new laws is the one relating to railroad rates and practices. A radical bill for the inspection of beef and the other products of great packing-houses, the Pure Food bill and the bill removing the tax from denatured alcohol stand near the top of the list. One new State was made, and under certain conditions another may be added. The consular service was reorganized. It was decided that the Panama Canal should be constructed with locks, and $42,000,000 was appropriated to meet the cost of the work until the end of this new fiscal year. A new naturalization law, requiring uniform practice and establishing safeguards against fraud, was passed.

Provision was made for national quarantine, to prevent such dangerous and unseemly controversies between States as were seen during the recent epidemic of yellow fever at New Orleans. The application of our coastwise navigation laws to trade with the Philippines was postponed for three years; an employers' liability bill was carried to enactment; measures were taken for the preservation of Niagara Falls; authority was given for the construction of a battleship larger than any now in existence; provision was made for a final settlement of the affairs of the five civilized Indian tribes; and for the first time money was appropriated expressly for the traveling expenses of the President.

On the other hand, there were a few omissions, or postponements which may point to unwise action hereafter. The House should have followed the Senate in passing the bill prohibiting contributions from corporations to national campaign funds. Perhaps it will do so next winter, after the Congressional elections. In the Senate, the House bill reducing the tariff on imports from the Philippines should have been promptly accepted. But it has not yet been finally rejected. It is much to be regretted that the Isle of Pines treaty was not ratified. We should have been glad to hear of the ratification of the treaty with Santo Domingo. The proposed modification of the Chinese exclusion laws, legislation suggested by Germany's new tariff, and the pending labor bills, deserved to be discussed, at least, if time for discussing these questions could be found. But it may be that there was not time. We must not forget how much time was required for the important work that was done.

The Railroad Rate and Meat Inspection bills were not made ineffective by the changes agreed upon at the last moment. When pipe lines were exempted from the provision forbidding common carriers to transport products owned by themselves, this was not proof that Congress had yielded to the influence of the Standard Oil Company. The change, while it was one desired by the Oil Trust, was also one distinctly in the interest of independent producers. Nor is it truthfully to be said, in our opinion, that the House surrendered to the packers when it insisted that the cost of inspection should be paid by the Government. In many respects the two bills were improved after their first passage in one branch or the other. This is most clearly to be seen in the case of the railroad bill. Probably both were improved in the final conferences. The bill for reorganizing the consular service was injured when the original provisions for applying the merit system were rejected. But the error has been corrected by the President's recent Executive order.

A great extension of Federal authority, some say, is indicated by the most important legislation of the session. We should call it a needed exercise of authority already existing. Year by year, with the growth of our manufacturing industries, the consolidation of industrial corporations and railway interests, and the increase of power that has attended the increase of the wealth of small groups of men, the inability of States to deal with the most formidable of our domestic problems has been more clearly shown. Fortunately, the Constitution, as it stands, empowers the national Government to do the work—of regulation

and restraint in the interest of the public—of which the States can do only a part.

It may be predicted, with confidence, that if the present Constitutional grant of power shall prove insufficient for the work of this kind which needs to be done, this grant will be enlarged by the people. The enforcement of such laws as have been enacted by the present Congress will soon show how broad is the scope of the Constitutional provision upon which the authors of them rely. If there were no other evidence that such laws are enacted in response to an almost universal popular demand, sufficient proof would be found in the fact that this legislation has not been of a partisan character, but has been sustained by almost unanimous action in Congress.

In this legislation Congress has been obedient to public opinion, but this public opinion has been represented forcibly by the President, by whom it has been stimulated and even created. The Railroad Rate bill and Meat Inspection bill were his own propositions. But for him these two laws would not now exist, and the enactment of the Pure Food bill, lagging for years, was due, in part, to the influence exerted by the discussion of these other bills and the investigations that compelled support for them.

We do not overlook the influence of those who are commonly called the muckrakers. They have been shaping public opinion. What some of them began has been completed by official investigators working under the President's direction. Others have assisted. The President was the one man, who, by virtue of his office, his energy, and his hold upon the confidence of the public, could lay the gist of all these disclosures before the law-makers, and present it so forcibly and persistently that legislation must follow.

His methods have sometimes invited criticism; his recommendations may have been occasionally defective in respect to details of procedure; but his work as a whole has been of great and enduring service to the people. Incidentally, he has given the Senate an opportunity to elevate itself in public estimation by exhibiting its powers in a memorable debate and by displaying an unexpected radicalism in defense of public interests against the greed and lawlessness of some great corporations. Incidentally, also, he has effectively served the Republican party by encouraging and giving fresh life to its radicalism and reform tendencies, and by weakening, in the public judgment and in fact, the influence in it of those corporate and other alliances, which, if accepted and persistently defended, tend to imperil the preservation of a popular majority.

You Mr. Ghent

In an article published in The Independent, this week, you, Mr. Ghent, under the title, "You Retainers," address the professional classes generally, editors, ministers, lawyers, judges, teachers, professors, as the paid and hired advocates of a most oppressive industrial system; necessarily oppressive because not socialistic. You charge us with being no less the dupes than we are, in our "ineffable meanness," the subservient tools of our "capitalist masters," possessing as we do only a "servile class conscience." We pass the article over to the judgment of our readers, who will consider what is the obliquity of its ethics and what the charity of its discourtesy, and how far is justified its sneering contempt for the *bourgeoisie*. We also leave the reader to judge whether the description of the degradation of the working classes is justified, when one sees every plain and hill of our happy Republic dotted with their comfortable homes.

So we "Retainers" have a word to reply to you, Mr. Ghent. Somewhat we agree with you; much we admire you, and much of your invective we denounce as unjust. We believe that we know the proletariat about as well as you do. It is they for whom we work. They are the patrons of our newspapers and our churches, and their children are our scholars. They are our supporters; they are not yours. The labor unions we believe in, as well as you.

To be sure, we do not, like you, stigmatize as "scabs" those who work outside the unions; but we recognize and approve the unions, so long as they aid their members and keep the peace. You charge us as a class, the overwhelming

majority of us, "publicists, professors, teachers, ministers, editors, lawyers and judges," with being indifferent to the sufferings of the working people, which find sympathy only with you, a professional writer, and a few others of your kind. We do not say that your attitude of superior arrogance is an evidence of intolerable conceit, nor do we dare to call your prophetic maledictions rude malevolence, for it is clear that you honestly regard yourself as the prophet of a new social morality, whose duty it is to awaken us with your curses. We admire the confidence of your courage, equally as we admire the charm of your polished eloquence.

But you address us as "retainers," paid and supported by the social organization which we are compelled to defend. What are you? You are no practicing artisan. You do not make your living as a housesmith or a printer. You may have been such as a youth; and so were we. You, too, are a retainer; you make your living as a representative and defender of Socialists, and, incidentally, of labor unions. To be sure we grant that you are honest and earnest; but so are we. We are not as passionate as you in our beliefs, for we give our chief energy to making a living in other ways than as the paid advocates of the social system in which we live, but would it not be decent for you to allow that we may be as honest in our approval of the rights of individual property as you are in your doctrine of collectivism?

You charge us with a selfish disregard of the evils of child labor, and of the multitudes of deaths and accidents in the railroad service, and in various dangerous or poisonous occupations. One would think, to hear you talk, that you and your unions had been the only forces which had abolished or diminished social evils. We teachers, ministers, editors and professional men were in this business before your first labor union was organized. Where were you when Wilberforce and Clarkson were putting an end to slavery in the West Indies; or when a similar work was done in this country? It is our work quite as much as yours which has nearly abolished child labor by compulsory attendance at school. Who care for children by creating our elaborate public school system? It is the men whom you abuse. And you want the railroads owned by the State. So do we, not, however, because we believe that men will be more careful, and that deaths by collisions or couplings will cease. They have just such accidents in countries where the public owns the roads, and just as many—do they not? in Italy, or as in England, and just as many and as mischievous strikes.

But to get at the bottom of your complaints. It is that we do not immediately accept your doctrine of "the common ownership of the means of production." But have not we, the classes you inveigh against, gone far in that direction? Are we not half socialistic in our roads, parks, water works, public schools, post office, and are not the nations you attack as most individualistic doing the most in this direction? And are we not trying, as fast as we can, to extend the scope of collectivism, so far as public utilities and natural monopolies are concerned?

But you want common ownership of *all* the means of production. We may come to it, but you must allow us an honest purpose in that we lag behind you in accepting that doctrine. You claim to represent the interests of laborers; so do we. The overwhelming majority of wage-earners reject your doctrine, the "6,468,964 workers" you tell of. The largest of all classes of laborers, the farmers, are to a man against you. Why, then, should you abuse us for agreeing with your clients, seeing that they refuse to take you as their advocate?

Now a word as to the selfishness you accuse us of. We do consider our own interests; so do you; so does everybody. We send men to Congress to represent the interests of their State or district; but they do not cease to regard the interests of the common country. You and we, employers and employed, who you say are enemies at war, and bound to remain such until your socialism is achieved, must consider each their own interests, but not neglect that of others. Such is our idea of our duty, for we believe in altruism. We do not sneer at "faithfulness" any more than we do at "thrift," "sobriety" and "morality." But it is the nadir of class selfishness to

which you descend, and where your unwilling clients will not all follow you. We do not refer to your treatment of so-called "scabs," for you describe them as "that infinitesimal fraction who are prevented from displacing union men," for if they are so few they are not worth considering, and it should not have been worth your while to palliate the violence which they suffer. Nor do we refer to the general support by the artisan class of a protective tariff to increase their wages to the injury of laborers abroad and of the purchasers of their products at home. We rather refer to their rules against apprentices, and their urgency to limit immigration and shut out those who escape from oppressive labor conditions in other countries. We believe in your labor unions, for they do good; they match the combinations of capital; but selfishness is a vice and self-interest a virtue limited to no class.

We cannot, Mr. Ghent, answer railing for railing. We do not think it would be courteous or just. We do not say that you are "dishonest," that you "prate and drone cheap moralities," to quote only from the first half-column of your long article; for we believe you are honest, and you don't drone, if you do prate. We admire your earnestness, the literary art with which you adorn your philippic and the poetry with which you beribbon your rapier. Neither our space nor our choice allows us to follow your example. We simply wish to indicate that you have no monopoly of honesty, and that the class for whom you assume to speak repudiates your right. But we agree with you that we want more socialism, while we cannot agree that private wealth is theft.

Municipal Reform in Kentucky

THE multitude of visitors the past two weeks to Louisville, Ky., have had the pleasure of learning of an effort to relieve it of the discredit of furnishing "a horrible example" of municipal misgovernment; for the public spirited citizens who are actively engaged in devising ways and means for the relief of the city deny that "Louisville is hopelessly and helplessly corrupt." They frankly admit, however, that there has been great political corruption—that for years the city has not had an honest election and that that held last November was as bad as any election held anywhere. It is asserted that the records will show that every crime against the ballot that could be committed was committed during the two days of registration and on the day of election.

Those who repudiate the declaration that Louisville is hopelessly corrupt base their belief upon the following facts: Normally Louisville is a Democratic city. For years there was no such thing as a Republican organization, tho there were many Republicans. Republicans and independent voters increased with time and occasionally they carried an election, altho the results were not always such as to inspire sufficient confidence to justify a continuance. The consequence has been the building up of a strong political machine within the Democratic party. This machine, as elsewhere, has become a close corporation, with rotation in office, but a rotation of practically the same persons. Like so many Southern cities, Louisville has in the main shared the belief that it was necessary to maintain party loyalty; and the politicians have done all in their power to confirm that belief. Ten years ago, when a Good Government Club was organized, there were few independent voters; since then their number has largely increased. The doctrine that partisan politics had no place in the municipal election, never anywhere of rapid growth, gained slowly in favor; and the last election showed the advances which it had made.

After the election of 1903, which had also been marked by great frauds, a few public-spirited citizens met to discuss the situation. An effort was made to raise $15,000 to prosecute the most flagrant cases. Those having the matter in charge were compelled to report that they were unable to raise any sum of consequence. Preceding the November, 1905, election, however, interest had been so awakened and had so far developed that a vigorous City Club was organized and enough enthusiasm evinced to encourage the belief that something could be done; and $10,000 was raised in a very few minutes after the election to provide the costs for the contest which was determined upon. For many months

the best lawyers of the city and many of the younger members of the bar have been doing splendid work in taking depositions and collecting evidence to be used in the trial of the cause. Before it is completed it will probably be the most stupendous task of the kind ever undertaken in Louisville, or, for that matter, in the South. In addition, numerous prosecutions were brought to punish those responsible for the frauds; but it will be weeks before the cases can be decided.

These facts are cited in justice to those who have been working long and earnestly in Louisville to bring about a change in affairs. Where people proceed in such a practical manner it cannot be said that their condition is hopeless or helpless. There is a steady growth of municipal reform sentiment in Louisville, and the list of those desiring honest elections and clean politics is growing day by day; and the recruits are coming from the bone and sinew of the community. The young men are interested as never before. The hope of a people lies in its honest, incorruptible, intelligent youth. The outcome of this contest may be disappointment; but the spirit of determination indicates that this disappointment will be but temporary, and that Louisville will join with her sister American communities in throwing off the shackles of corruption and of partisanship and enter upon a career of public spirited municipal development.

As we write this we see the reports of the open bribery of voters at the white Democratic primary at Savannah, Ga., where men stood on the public street and bought votes at from ten to forty dollars each, twenty-five dollars being the usual price. This equals the worst we hear of Rhode Island elections. When conditions are so bad we may look for the moral reaction which has encouraged the citizens of Louisville to believe that their city is not "hopelessly and helplessly corrupt."

A Barbarous Teaching

When the public mind is stirred by a great tragedy the current comment is seldom profound. The sensational features are too exciting, and the temptation to platitudinous moralizing is too alluring to allow of much attention to any real significance that the occurrence may have. The attitude of the community toward the shocking taking off of Stanford White has been no exception to this rule.

Careers like those of White and the man who killed him, are, unfortunately, not novel. There have been such men as they in all ages, and others like them could be found in all our American cities. Sometimes they come to tragic ends, and sometimes they are gathered to their fathers full of years and of worldly honors, and only their most intimate associates ever know what manner of men they have been.

The social conditions, also, that have been revealed by this deplorable affair are in no wise worse than conditions that have prevailed since history was first recorded. In fact, they are probably somewhat less bad than those which distinguished the "best circles" of Sodom, and the Roman four hundred.

Nor yet is there anything new in the swift taking of life by an enraged man, who feels that he has been injured beyond endurance. The first murder happened a long while ago.

That which is new in the moral life of man is the more and more complete substitution of a legal redress of injury for the mad deeds of private vengeance. This substitution is of the very essence of civilization, in distinction from barbarism. Thru toil and tribulation, calm-minded men have built up a certain measure of social control over individual wrath and self assertion. They have thereby made life safer for all. And, what is of not less importance, by restraining the most furious of human passions, they have in a measure disciplined the whole nature of man, enabling him more successfully to bring all his passions under the control of reason.

It is a lapse from civilization into barbarism, then, when, under stress of any excitement, we forget this enormous moral gain, and allow ourselves to justify those acts in which men, defying the order established by all for the good of all, take vengeance into their own hands.

The most sobering element in this latest social tragedy, therefore, is not the

wickedness which it has brought to light; it is the disposition manifested in many quarters, and voiced in a portion of the public press, to regard the act of Mr. Thaw as a justifiable homicide.

We should be among the last to wish to deprive Mr. Thaw of any defense to which he is morally or rationally entitled. If it can be established that at the moment of his crime he was irresponsible, either thru mental unsoundness or because of an overwrought emotional state that inhibited self-control, he should have the whole benefit of whatever doubt that fact may create in the minds of his jurors. There have been noteworthy cases of acquittal on the ground of momentary emotional insanity. One of the most celebrated in New York history was that of MacFarland, indicted for the murder of Albert D. Richardson, whose widow, Abby Sage Richardson, lived to be as much respected and beloved for her qualities of character as she was admired for her literary talents.

But it is one thing to give all the benefit of this doubt to the indicted prisoner, and it is a different thing to say that a man injured, as Thaw believed himself to be injured, is justified in killing the man who has wronged him. There may be some among those who are urging such justification because they are mentally confused. They fail, perhaps, to see that the acquittal of a man who is thought to be too irresponsible to realize that his act is unjustifiable, is not the same thing as calling his act justifiable. We are not at present addressing such persons, except in so far as we would urge them to sharpen their wits. We are condemning those whose minds, tho keen, are also perverted enough to teach that, under circumstances of extreme provocation, it is morally right and socially wholesome to inflict swift private vengeance upon a certain class of wrongdoers.

It has been reported, for example, that a clergyman, whose distinction is that he happens to be the spiritual guide of John D. Rockefeller, has said that it would be a good thing for society if men who take liberties with their neighbor's wives should more often suffer the fate of Mr. Stanford White. Remarks of this kind, by whomsoever made, belong all to one category. They belong to the category of those wretched attempts to justify a code of honor that survived from barbarism; a code which has too long flourished in many of our American commonwealths, which not long ago saved from the gallows a prominent official in a Southern State, and which openly justifies the lynching of negroes for "the usual crime."

We cannot afford to defend this code of honor of the uncivilized man. For uncivilized he is who cannot submit his personal grievances to the orderly and solemn arbitrament of organized society. His provocation may be more terrible than he can bear, and under it he may lose his self-control; but let not him or his friends say that in cold blood he may rightly take the supreme law of vengeance into his own hands. That way lies the chaos from which we have painfully struggled forth.

Marking Western Trails

It is encouraging, as well as interesting, to note that the West is awaking to the value of landmarks and is seeking to locate permanently some of its most prominent reminders of frontier days before they are forever obliterated. Prominent if not chief of these are the old highways over which the pioneer emigration took its way long before such a thing as a tourist car was imagined. The "trail" was an essential part of the West's development, and the tens of thousands of families that traveled by such routes made up the sinew of the new population.

Of course the principal of these thorofares of early days was the "Santa Fe Trail" leading from the Missiuri River to California over the southwestern route. Even today signs of its well worn path may be seen in deep furrows on the pasture lands, tho much of its course has been obliterated by cultivation. In Kansas City sharp disputes have arisen regarding the exact course, and the lovers of historical accuracy have insisted that the line be marked before first hand information knowledge thereof is lost forever.

The Daughters of the Revolution in

Kansas have set themselves the task of doing this. The Legislature appropriated a thousand dollars to help them and the school children have contributed as much more. With this and future assistance it is proposed to place every mile along the 400 miles of the trail's course thru Kansas a monument properly inscribed and with the familiar design of a "prairie schooner" as an emblem of the past. It is expected that the States and Territories to the west will continue the work until the long journey is identified for the coming generations.

Of scarcely less interest is a movement for the marking of the "Old Oregon Trail" from The Dalles eastward to Indianapolis. It was by this route, with its many fan-like dependencies, that the Pacific Northwest was settled. The emigrants, with their linch-pin wagons, made eight months' journeys into what was then an unknown land, and met with many a terrific experience growing out of the hostility of Indians and the dangers of the prairie fire. From the Missouri River eastward it will probably be difficult to trace this primitive roadway, but the Western end should be amenable to the historian's most practical treatment.

Then there is the plan of George Wharton James and Charles F. Lummis to turn into a State road the old "Camino Real" over which the Jesuit mission builders pushed up from Mexico at the time the trade with the Southwest was developing. Romance and adventure are a part of the history of this famous highway, and the stories of its days of glory make up a part of the most delightful portion of the records of California's youth. California's Legislature can scarcely refuse to help in this movement; nor in the one to identify the trail of the gold hunters who took their caravans westward from "St. Joe" and crossed the Sierras imbued with the courage of Pilgrim Fathers.

It is not enough that the bones of the vanquished in the struggle over the plains lie along the way; actual, visible, permanent milestones are wanted, and the placing of them is a real contribution to history. It has more than local interest, and will do much to inspire in coming generations a suitable respect for the privations of the early travelers across our great expanse of plain and mountain.

From the Lewis and Clark expedition in 1805 and the painful journey of Zebulon Pike only three or four years later these trails were the trunk lines of travel across the continent. To leave their well traveled ribbon of brown meant death. Until the railway came in the latter sixties, the canvas topped wagon and the ox cart had no rival. Lurid incidents, such as the Mountain Meadow tragedy, unceasing vigilance, frequent situations marked by great pathos and all the exciting train of adventure that is connected with the settlement of an untried land, brooded over these main traveled roads for more than half a century. It would be strange if the people of the West did not appreciate sufficiently the importance of these reminders of the past to preserve their records in permanent form. The West has too few historical possessions as it is, and it ought to make the most of such interesting ones as these.

American Provincialism

The one dark lining to the silver cloud of the record of Congress thus far appears in the evidence that while the people and Congress are interested in domestic affairs they have no proper interest in foreign affairs. The record of the legislation of Congress as to home matters is excellent, as our list of its enactments shows. But it will be observed that the omissions and neglects of Congress have to do with foreign relations. There was the whole series of treaties quite passed by, the treaty with Santo Domingo, the Isle of Pines treaty, and the commercial treaty with Germany. Equally the bill for the relief of Philippine customs so earnestly asked by Secretary Taft has been neglected. There is a certain brutal selfishness in such neglect of our duty of courtesy and justice to foreign nations and to our own colonies. Equally no action was taken to meet the requests of China for a more decent immigration law, and no bill, even to that effect was considered, simply, we judge, because the President saw it was of no use to have a conflict with Congress on the matter. All the President

could do was to direct a less drastic execution of the present exclusion law. Our people seem to be provincial in their exclusive interest in their own affairs. One of the most successful of our New York journalists once remarked, that if he could have his way he would print no foreign news at all; and we have observed, with regret, how few are the daily papers that seem to pay any attention to foreign news.

Consular Reform

One who reads the daily published "Consular Reports" has discovered that under the present Administration, being a consul is quite a different job from what it used to be. Some of our most disgraceful scandals abroad have come from incompetent consuls appointed by political favor, sometimes dishonest, and sometimes drunkards. At last it has come to be the turn of this department to feel the touch of the President, who was once a member of the Civil Service Commission, and who then added greatly to its efficiency. During his Presidency he has done much to enlarge the merit system, and his order taking the consular service out of politics is one of the most important of all his reforms. Now no man can be made a consul without passing a thoro examination and then can be appointed only to the lower grades. In fact, the candidates must, generally, be those who have, from their youth, chosen the service as consular clerks. The higher appointments will be by promotion. Our readers will remember that in the article, "What Can a Young Man Do?" by Governor Rollins, in our issue of last week, the consular career was one of those mentioned as new to the young man of the present age. It is to be commended to young graduates. A candidate must know one other modern language besides English, and must pass an examination on American and foreign commerce and international and maritime law. Our President's vision looks abroad, even if our people generally are blind to foreign affairs. If we had any foreign commerce perhaps we would take more interest in foreign nations.

The Texas Heretic

Rev. Dr. Caldwell, pastor of a Southern Presbyterian Church, in Fort Worth, Tex., was charged with heresy. He did not believe that Moses wrote the Pentateuch. He questioned the historicity of the early chapters of Genesis. He did not accept the truth of the miraculous accounts of Balaam's ass, of Samson, Daniel and Jonah; and he was charged with the further heresy of believing that while Christ died for man his death was not penal. His presbytery, that of Fort Worth, acquitted him, but the Synod was against him and ordered his name dropt from the roll of his presbytery. On this matter the case went to the General Assembly, which supported the presbytery against the Synod. Now, what should be done about it? He has been protected by the court; why not lynch him? We mean in some religious way. The Southern Presbyterian Church, the very home and seat of all orthodoxy, ought somehow to be protected against its temporizing with unbelief. Has the Church lost its record for stringency of faith so nobly shown in the trial of Dr. Woodrow, and in many another ecclesiastical field? What, with this chance lost, and the Southern Methodist General Conference, against the advice of three of its bishops voting to initiate a restatement of their creed, it looks as if we of the North might be required to send down missionaries of the strict theology; say, the men who are so proud of their success in forcing Professor Mitchell out of the Theological School of Boston University.

One of the results of the Loomis scandal was the sending of William J. Calhoun, of Chicago, to Caracas to investigate the past and present relations of the United States with Venezuela, and report the truth to the President. Judge Calhoun went to Caracas, stayed there several months, and then returned to Washington. Month after month has gone by, and yet his report has not been made public. "If not incompatible with the public welfare" we respectfully suggest that it is time it be published. It was certainly expected that the report would not be withheld from the public.

Title Guarantee and Trust Company's New Building at No. 176 Broadway.

The Title Guarantee and Trust Company's Building

A FEW days ago the Title Guarantee and Trust Company moved into its new ten-story home, at 176 Broadway. This building—designed by Messrs. Howells & Stokes, and erected by the Thompson-Starrett Company—was planned for the exclusive use of the company, which occupies every part of it. The front is of fine white granite, quarried at Bethel, Vt., and seen elsewhere in New York only in the Fifth Avenue residence of Harry Payne Whitney. The entrance is thru a domed rotunda, which opens out in three directions; on the right to the banking department, on the left to the mortgage department, and in the center, thru an arched vestibule, into the main lobby, a lofty pillared hall, around three sides of which runs a mezzanine floor affording room for a large number of employees. For other departments and uses the remainder of the building is admirably arranged. A company having so large and so valuable a collection of records needs many fireproof file rooms and vaults; these have been generously provided and are connected with each floor. On Montague street, in Brooklyn, a new building is being erected for the use of the company's branch in that borough. Clarence H. Kelsey is the company's president. Its growth, while rapid, has been of the most substantial character. Beginning business in 1883 with a capital of $600,000, the company now has a capital of $4,375,000, with $6,644,530 in surplus and undivided profits.

No "Fireproof" Buildings

LECTURING on "Fire, Fire Risks and Fire Extinction" before the Society of Arts (London), Prof. Vivian B. Lewes stated that there was no such thing as a fireproof building. The experience of fire underwriters during the past twenty-five years, he said, confirmed such a statement. Neither was there any such thing as fireproof material. Under the action of fire granite and stone splintered, marble turned into lime, bricks fused, and iron and steel melted.

It is much more important to use a non-inflammable than any supposed fireproof substance. The remarks of the English professor seem to have been borne out in most of our recent conflagrations. In Baltimore many of the so-called fireproof buildings offered no resistance to the supreme test to which they were subjected. In New York city widely advertised "fireproof" buildings have been totally destroyed by the devouring element more than once. In San Francisco the fire spread over a great area and its progress was not stayed by the fireproof buildings within it. Every conflagration and many individual fires teach lessons regarding the insufficiency of the term "fireproof" objected to by Professor Lewes, but in spite of such lessons buildings of precisely the same character are suffered to replace those destroyed, and the term "fireproof" continues to be overworked.

SINCE 1900, the cotton mill industry in the South has more than doubled, both in spindles and in capital invested, the number of spindles rising from 4,452,000 to 9,470,000, and the capital from $112,837,000 to $230,000,000.

....The Central Trust Company of Illinois, of which Charles G. Dawes is president and William R. Dawes cashier, and whose capital stock is $2,000,000 and surplus and undivided profits $915,122.98, now has total resources amounting to $13,036,423.79.

....It is well worth a visit to Brooklyn to inspect the safe deposit vaults in the new building of the People's Trust Company, of which Edward Johnson is president. The latest devices in construction have been introduced, and neither pains nor expense have been spared in making these vaults absolutely fire and burglar proof.

....Dun's Index Number of commodity prices proportioned to consumption was 106.794 on June 1st, against 106.059 a month earlier and 98.759 one year ago. Altho the advance in May was not large, it made for June 1st a new high record for the last twenty-two years.

....The annual report of the American Car and Foundry Company, submitted last week, shows an increase of net earnings so large that $1,357,659 was added to the surplus, which is now $14,113,094. In the past year the company made 73,540 cars, against 35,857 the year before. At the beginning of the new year there were orders on hand for 71,339.

....The directors of the Windsor Trust Company, Mutual Life Building, with a branch at Fifth avenue and Forty-seventh street, elected John Alvin Young president last week, to fill the vacancy caused by the death of Justice Charles H. Van Brunt. Mr. Young has been vice-president and active manager of the institution since its organization. The directors declared a semi-annual dividend of 3 per cent., and announced that the assets of the company were $15,000,000 and the deposits $12,000,000, an increase of $4,000,000.

....Dividends and coupons are announced:

Guanajuato Cond. Min. & Mill Co., 1½%, payable July 31st.
Fourth Nat'l Bank, 3½%, payable July 2d.
Harlem Savs. Bank, 3½%, payable July 16th.
Amer. Chicle Co. (Preferred), 1½%, payable July 2d.
Amer. Chicle Co. (Common), 1% and extra 1%, payable July 17th.
Internat'l Silver Co. (Debenture Coupon No. 7), payable July 1st.
Minn. & St. Louis R. R. (1st Mort. 7s), coupons, payable July 1st.
Des Moines & Fort Dodge R. R. (1st Mort. 4s), coupons, payable July 1st.
Dollar Savings Bank, 3½%, payable July.
Washington Savings Bank, 4% up to $500, 3½% over $500.
N. Y. & N. J. Telephone Co. (Quarterly), 1½%, payable July 16th.
N. Y., Ont. & Western R. R., 2%, payable July 30th.
Electric Storage Battery Co. (Common and Preferred), 1¼% each, payable July 2d.
United Copper Co. (Quarterly), 1¼% and extra ½%, payable July 31st.
Twelfth Ward Bank (Semi-Annual), 3%, payable July 2d.
Wells, Fargo & Co. (Semi-Annual), 5%, payable July 16th.
Franklin Savs. Bank, 3½%, payable July.
Greenwich Savs. Bank, 4%, payable July.
Des Moines & Fort Dodge (Preferred), 5%, payable August 1st.
Gen. Rubber Co. (Gold Debenture Coupons), payable July 2d.
Bronx Savs. Bank, 4%.

The Independent

VOL. LXI NEW YORK, THURSDAY, JULY 12, 1906 No. 3006

Survey of the World

The President's Address on the Fourth

Mr. Roosevelt spoke for nearly an hour, on the Fourth, to his fellow townsmen at Oyster Bay. As a nation, he said, we should approach the problems of today in the spirit in which Lincoln met the trials of his time. Lincoln "bore no rancor even to those who had gone hopelessly wrong"; while endeavoring to cut out the evil, he yet did his work without hating the evil-doer; and he treated nothing that was done against him as a wrong to be avenged. A large part of the President's address related to the duties of citizenship and the qualities that characterize a good citizen. Here he repeated the substance of his speeches on this topic in past years. Referring to the exposures of iniquity in business, politics, and social life, he said that there was no warrant for growing hysterical about them. We should avoid overemphasis both in blaming and in praising ourselves and our country. We should war with the evil, but show no spirit of malignity toward the man responsible for it. We should remember that many wrong-doers have been exposed to special temptations, and we should try to remove the causes of their evil action. Turning to recent legislation, he said:

"This year in Congress our chief task has been to carry the Government forward along the course which I think it must follow consistently for a number of years to come—that is, in the direction of seeking on behalf of the people, as a whole, thru the National Government which represents the people as a whole, to exercise a measure of supervision, control, and restraint over the individuals, and especially over the corporations, of great wealth, in so far as the business use of that wealth brings it within the reach of the Federal Government."

"A fair amount" had been accomplished, partly because "we have approached the task absolutely free from any spirit of rancor or hatred":

"When it becomes necessary to curb a great corporation, curb it. I will do my best to help you do it. But I will do it in no spirit of anger or hatred to the men who own or control that corporation; and if any seek in their turn to do wrong to the men of means, to do wrong to the men who own these corporations, I will turn around and fight for them in defense of their rights just as hard as I fight against them when I think that they are doing wrong. Distrust as a demagog the man who talks only of the wrong done by the men of wealth. Distrust as a demagog the man who measures iniquity by the purse. Measure iniquity by the heart."

Mr. Bryan and the Presidency

Mr. Bryan arrived in London from Norway on the 3d, and was at once questioned by reporters concerning the preparations for his reception in New York. That reception, he said, must not be regarded in the light of an indorsement for the Presidential nomination. While he appreciated the compliment paid by the various State conventions, he did not regard their expressions as binding upon them or upon the party of their States. "I shall not prosecute them for breach of promise," said he, "if they transfer their affections to another; I will not even publish their letters." To allow the reception to be regarded as an indorsement would be "unjust to others who may be candidates":

"I have seen the names of several mentioned as possible candidates, among them Congressman Hearst, Senator Bailey, and Governor

Folk, who have all rendered conspicuous service to the party and the country; and their claims should be considered. The party is entitled to its most available man, and the question of availability cannot be determined so far in advance. Circumstances and issues may strengthen the claims of some one of the gentlemen mentioned, and the list should be an open one until the time comes to choose. I may add that it would not be just to me to be put in the attitude of announcing my candidacy or of admitting the certainty of my being a candidate. It is two years before the convention meets, and I am not willing to sit on a stool and look pretty that long."

On the 7th, however, ex-Senator James K. Jones, who was chairman of the Democratic National Committee in the Bryan campaigns of 1896 and 1900, gave to the press a letter, dated at Stockholm on June 18th, in which Mr. Bryan said that he would accept the nomination for the promotion of certain reforms:

"I have been watching political developments and have noted with gratification the vindication of Democratic principles. You have correctly stated my position. As I wrote to Colonel Wetmore, I shall do nothing to secure another nomination and do not want one unless the conditions seem to demand it. I may add that I enjoy the freedom of private life and feel that I can do some good without holding any office. There are, however, certain reforms which I would like very much to see accomplished, and to assist in the accomplishment of these reforms I am willing to become the party candidate again if, when the time for nomination arrives, the advocates of reform are in control of the party and think that my candidacy will give the best assurance of victory. If some one else seems more available, I shall be even better pleased."

Congressman John Sharp Williams, leader of the Democrats in the House, has published a statement, in which he says of Mr. Bryan: "He is no Socialist, but rather an intense individualist. He may make some mistakes about the means, but never about the ends he wishes to attain. Those who once trusted him trust him yet; thousands who distrusted him trust him now, and other thousands are beginning to trust him. He will be elected." Senator La Follette says: "As things stand now, Roosevelt is the only man who could defeat Bryan." Mayor Tom L. Johnson, of Cleveland, accepts the invitation to preside at the reception in New York, writing a long letter full of praise of Mr. Bryan. "For almost ten years," he says, "democratic Democrats have known that the Presidency was taken from him by a huge corruption fund distributed by corrupt and corrupting beneficiaries of privilege." On the 7th, Mr. Hearst gave to the press a long statement, beginning with the words: "I would like to say very positively that I am not a candidate for the Democratic Presidential nomination in 1908." Referring to Mr. Bryan's list of possible candidates, he remarked that he would substitute Stevenson for Bailey. Having commended Bryan and Folk, he added that Bailey's nomination for second place was conceivable. "It would have the material effect of eliciting a substantial campaign contribution from John D. Rockefeller, but its disadvantages would be obvious." He had done his duty, he continued, in making the fight against the forces of corporate corruption in 1904, but he would never undertake another contest in that way. "I am well pleased, as I am well satisfied, to use the powers of my publications to drive out of office the white slaves of the Trusts and to promote the fortunes of the honest servants of the people, and I cannot do this as effectually if I am mixed up in purely party politics." It is understood that Mr. Hearst is a candidate for the office of Governor of New York.——On the 4th, at the Independence Day dinner of the American Society in London, Mr. Bryan read a long address on "The White Man's Burden." Introducing him, Ambassador Reid said he believed Mr. Bryan was as well satisfied as he himself was, tho by different reasoning, that the United States had not been ruined by its gold. Mr. Bryan replied that when he saw the progress his country had made walking on one leg, he wondered what it would have done walking on two legs. Two days later, having heard that his address had led some people to think that he had become an imperialist, he said:

"Nobody can read it carefully and honestly and find in it the slightest trace of approval of a policy of seizure and despotic control. I spoke in favor of the peaceful spread of knowledge and morality. I declared for an altruistic attitude toward the backward races. I distinctly indicated that the consent of the governed is the only rightful source of authority. The world must have peace; the liberties of its peoples must be inviolate. Progress must result from intellectual and moral, not from physical, means."

Secretary Taft in the South

Secretary Taft opened the Congressional campaign, on the 9th, with a speech at Greensboro, N. C. That the address was a partisan one may be shown by the following passage concerning the Democratic party:

"It has no policy which the country can depend upon. Its whole stock in trade is irresponsible criticism and obstruction; when charged with the responsibility for doing anything, it utterly fails. It is made up of elements so incongruous that when called upon to take affirmative action it lacks the cohesiveness necessary for the purpose. It is a party of negation and inefficiency."

It was not in a partisan spirit, he said, that he expressed a belief that no political change could work greater advantage to the whole country, and especially to the Southern States, than a breaking up of the "Solid South." What he regarded as the disadvantages of the unchallenged domination of one party he set forth at length. Owing to the South's unvarying allegiance to the Democratic party of the North, Southern interests and the Southern people had been misrepresented in Congress and in national politics with respect to tariff protection, the Philippines, the Canal, and the Santo Domingo treaty. He sharply criticised Republican organizations wherever they represented "little save a factional chase for Federal offices." The Republican party in North Carolina, he asserted, "would be much stronger as a voting party if all the Federal offices were filled by Democrats."

Important Rebate Decision

An important decision was made in New York, last week, by Judge Holt, concerning certain defendants in the sugar rebate cases. The indicted corporations and persons were the New York Central Railroad Company, the American Sugar Refining Company, Nathan S. Guilford (vice-president of the Central), F. L. Pomeroy (general traffic manager of the same company), C. Goodloe Edgar and Edwin Earle, the last two being merchants of Detroit. In addition to indictments for violation of the law which forbids the granting of rebates (the penalty being nothing more than a fine), there was one for violating Section 5440 of the Revised Statutes. This section provides a penalty of imprisonment (not more than two years) for conspiracy "to commit any offense against the United States or to defraud the United States in any manner or for any purpose." Under this indictment, Guilford, Pomeroy, Edgar and Earle were accused of conspiring to commit the offense of violating the law against giving rebates. They demurred, and Judge Holt sustained the demurrer. It was under an indictment of this kind that Thomas and Taggart were found guilty in the Federal Court at Kansas City, and (on the 22d ult.) were sentenced by Judge McPherson to be imprisoned in the penitentiary. In December last, Attorney-General Moody, in a long letter to the District Attorneys concerning rebate prosecutions, said: "I suggest to you that in all cases where the evidence warrants it, an indictment for conspiracy to commit an offense against the United States, based upon Section 5440 of the Revised Statutes, be obtained. The Supreme Court has held that a conspiracy to commit a crime, itself punishable only by fine, may be punished by imprisonment." In sustaining the defendants' demurrer, Judge Holt said that the most serious objection to the indictment was that Congress, in passing the Elkins act, expressly abolished imprisonment as a penalty for any offense to which that act related. As Congress clearly intended in the Elkins act to abolish imprisonment for the offense of giving or taking rebates, and to substitute therefor a heavier fine, the indictment could not be sustained. The contention of counsel for the Government that conspiracy to commit a crime is an offense distinct from the commission itself of the offense was disapproved. "The claim," said Judge Holt, "that the agreement to give rebates is a conspiracy punishable by imprisonment, while the actual giving of rebates is an offense punishable only by a fine, seems to me too subtle a distinction to be drawn in the administration of the criminal law." In the Railroad Rate law recently enacted, the penalty of imprisonment for rebating is restored. But Congress did not intend, the judge said, that this legislation should be retroactive, therefore it could not be applied to these defendants for offenses committed some time before

the bill became a law. Demurrers against other indictments in these cases were overruled, and the defendants accused under those indictments will be tried for violation of the laws which forbid the giving or the receiving of rebates. In the Kansas City cases, Thomas and Taggart have taken an appeal. In due time, therefore, the Supreme Court will decide finally whether rebaters can be tried (and if convicted, imprisoned) under the conspiracy statute. The question is a very interesting one, because it is understood that Mr. Moody (and the President) desire that prominent offenders, who may soon be indicted, shall be accused under this statute, and, if convicted, be sent to the penitentiary.

Other Rebate and Trust Cases

John N. Faithorn and Frederick A. Wann, officers of the Chicago & Alton Railroad Company, were found guilty at Chicago, last week, of giving a rebate of about 25 per cent. on meat shipped from Kansas City by Schwarzschild & Sulzberger. They asserted that the money was paid for the use of the packers' side tracks.——The Government's investigation in preparation for suits against the Standard Oil Company and the railroads from which the company is said to have received rebates is in progress thruout the country. Evidence will be laid before a grand jury in Cleveland this week. In Findlay, O., the county prosecutor, aided by the Attorney-General of the State, has brought suit against the Standard Oil Company, John D. Rockefeller and two of the Standard's subsidiary companies, for violation of the State's Anti-Trust law. A summons for Mr. Rockefeller has been issued and will be served upon his return from Europe.——The ice dealers arrested in Philadelphia for criminal conspiracy have been held for trial. District-Attorney Moran, of Boston, has sent for copies of the Philadelphia Attorney's brief, desiring to proceed against the ice dealers of his own city. Prosecutors in Pittsburg, Baltimore, Washington and Indianapolis are preparing to take action against ice combinations said to have been formed in those places.——A preliminary report has been made by the committee appointed by the directors of the Pennsylvania Railroad Company to inquire as to discrimination in coal traffic. It says that only a very small percentage of the shippers testified that they thought there had been discrimination; that no undue preference was proved; and that the number of officers or employees holding coal shares is very small. A most searching investigation is promised. The Audit Company of New York, with fifty accountants, has been employed to go over the accounts and records of the last six years. Upon the recommendation of the committee, President Cassatt has issued a general order requiring all officers or employees to get rid of their shares in coal companies doing business along the lines, and of any other interest the holding of which might conflict with their duty.——The nomination of Franklin K. Lane, of San Francisco, having been confirmed, there were two places in the Interstate Commerce Commission to be filled. E. E. Clark, of Cedar Rapids, Ia., chief of the order of Railway Conductors and formerly a member of the Anthracite Strike Commission, has been appointed to one of them.

Panama and Other Southern Countries

The Isthmian Canal Commissioners who were not confirmed by the Senate have been appointed again by the President, with the exception that Mr. Bishop's name has been dropped and that Chief Engineer Stevens succeeds General Ernst, who was recently placed on the retired list of the army and has become a member of the International Waterways Commission.——Secretary Shaw anounces the coming issue of $30,000,000 of Panama Canal 2 per cent. bonds, for which bids will be received up to the 20th inst. These bonds will be available for the use of national banks as a basis for circulation.——The election of members of the Assembly, in Panama, on the 1st, was a peaceful one. In the Province of Panama there was a mixed ticket, made up by an agreement of the two parties. In the other provinces, as a rule, supporters of the Amador Government were successful.——More ships have been sent to Santo Domingo for coast patrol duty.

One of them is the cruiser "Columbia," carrying 400 marines. Revolutionists are active in the vicinity of Monte Christi, where 500 of them were attacked last week by 600 Government soldiers, but without decisive results. There had been futile negotiations with the rebels, who had insisted upon retaining control of Monte Christi. Officers of the insular Government have been conferring with representatives of the State Department, in Washington, concerning a suggested readjustment of Santo Domingo's foreign debt by a new issue of bonds. If the creditors should agree to such a readjustment, with provision for the payment of interest out of the revenue collected and set aside under the existing agreement, the pending treaty might be withdrawn. Ratification of it is not expected. The sum deposited in New York by the collectors now exceeds $1,300,000.——Guatemala and Salvador are at variance, owing to Salvador's alleged support of the revolutionists who have invaded Guatemala from the south. It is expected that the quarrel will be settled by arbitration. A special envoy from Salvador is now on his way to Washington, where the good offices of our Government will be sought to promote an arbitration agreement.——It is now known that Colombia's Minister at Washington, Señor Mendoza, was recalled, for his successor, Señor Enrique Cortes, has been appointed. Our Minister at Bogota says this is the first step toward the negotiation of a treaty for the settlement of questions arising out of the secession of Panama.

The Philippine Islands

Cholera of a very virulent type has appeared in Manila, but it is said that the epidemic is now under control. For the week ending on the 4th, the number of cases reported was 116, and 99 of them were fatal. The disease has spread, because the natives fail to report cases of it, being in fear of the health authorities and unwilling to submit to sanitary regulations. The greatest recent epidemic of cholera in the Philippines was in 1902, when the number of fatal cases reported exceeded 83,000. For a small epidemic beginning in August, 1905, the record was 713 cases and 553 deaths. Dying out in March last, the disease appeared again in the early part of May. At last accounts it had attacked only five Americans, two of whom died.——Attorney-General Lebbeus R. Wilfley has been appointed judge of the new United States Court in China, recently created by Congress at the suggestion of Secretary Root, and designed to correct abuses in the administration of justice thru the consular courts, in which the presiding officer in many instances has had very little knowledge of law. Judge Wilfley is a native of St. Louis, and for a time was judge of the court of first instance in the islands. His successor is Gregorio Araneta, a Filipino, who is now Solicitor-General.——Montalon, the most powerful outlaw in Luzon, has surrendered to the constabulary.

The Russian Deadlock

The Duma has now come into direct conflict with the Council of the Empire, the upper house of the Russian Parliament, which is dominated by the official class. The bill abolishing capital punishment passed the Duma, but there is no probability that it will be approved by the Council, at least in its original form, for a caucus of the Centrists, the principal party in the Council, has declared against it. The chief opposition to the measure came from the disturbed districts, Poland, the Baltic provinces and the Caucasus, where revolutionary activity is most feared. There is some reason to hope that the present Ministry will be soon replaced by one more in harmony with the Duma. In fact, General Trepoff, commandant of the Imperial Palace, who is regarded as the dominant force in Government now, gave a long and remarkably outspoken interview to the press, in which he advocated that policy as less dangerous than the present one of uncompromising opposition. He explained the cause of the revolution in these words:

"The great power of the revolutionists lies in their control of the press. Political passions are such that the most prudent men have lost their heads and are raving like lunatics over Utopian schemes, which can only result in

blood and flame. I cannot deny that the revolutionists have won over nearly all the men of talent. Even if moderate journals should be founded their promoters would find no collaborators. Furthermore, you know that the larger number of the papers of St. Petersburg are in the hands of Jews, and that most of the members of the staff are Jews, while the reporters generally are revolutionary agitators. Then see to what extent the Jews are represented in Parliament, and say what will prevent an upheaval, principally the work of Jews thru their cunning provocation of Christians and skillfully contrived posing as innocent victims of a bloodthirsty tyrant."

The Government has sent its bill for the solution of the agrarian problem to the Duma, accompanied by a long and eulogistic account of what the Czar's Government has done for the peasants in the past, and an argument to show that even if all the land were confiscated there is not enough to satisfy the demands of the peasants. The Government proposals are as follows:

"First—To distribute upon 'favorable terms' all the arable land in European Russia to the peasants who have not sufficient land.

Second—To purchase for the account of the state the land which private owners are willing to sell.

Third—To sell such lands to the peasants on reasonable terms, even if this should involve the assumption by the state of the difference in the cost and the selling price.

Fourth—To establish the principle that new, as well as old, peasants' lands cannot be sold to persons not belonging to the peasant class, besides exempting the land from seizure for debt.

Fifth—To assist emigrants to reach Siberia and Central Asia, and to help them in installing themselves there, not only by allotments and land, but by the building of Government roads.

Sixth—To make arrangements for the sale of the lands which the emigrants leave behind them for the benefit of these emigrants, the rigorous improvement of agriculture, correcting the inequalities in plots of land, etc., and the right of the distribution of the lands severally where desired."

The report is being circulated among the peasants that "the Little Father" wants to give them land, but that the Duma is preventing it. A Cossack member of the Duma was attacked by the police while he was addressing a mass meeting on the streets of St. Petersburg. A revolver was taken from him and he was severely clubbed. When the affair was reported in the Duma it aroused a storm of indignation, and Minister of the Interior Stolypin, who endeavored to explain and condone the action of the police, was howled down by the Group of Toil. Alladin, the peasant orator, declared that if the Government permitted such infringement of the right of inviolability of the members no Minister's life would be safe if he appeared in the Duma.——The official report of the Bialystok pogrom or Jewish massacre has been published, and the unprecedented action taken of communicating it to foreign Governments thru their Ambassadors. The Government report says that 82 persons were killed in the riots, of whom 75 were Jews, and that the property destroyed was only $100,000. It is admitted that certain inferior police officials were guilty of inciting and taking part in the attack on the Jews, but holds that the Jews provoked the outbreak by their revolutionary actions for months past. The Commissioners of the Duma sent to Bialystok state that 82 Jews and 6 Christians were killed, and assert that they have evidence to prove the following charges:

"First—That no religious race prejudice existed to warrant the measure.

Second—That the rioting was deliberately prepared by accusing the Jews of being revolutionists.

Third—That the day of the riot was announced in advance by the authorities.

Fourth—That the Administration and the troops acted lawlessly in permitting the systematic killing of peaceful Jews, including women and children, under the guise of suppressing a revolution, and that six of the military and civil authorities not only assisted, but participated in murders, tortures and robbery."

The English in Egypt

Sir Edward Grey, Secretary for Foreign Affairs, created a sensation in Parliament by giving a solemn warning against weakening the authority of the Government in Egypt by criticising its acts in the House. He said:

"All this year fanatical feeling in Egypt has been on the increase. It has not been confined to Egypt, but has spread along the North of Africa. It was for this reason that a little time ago the garrison had to be increased. The attack on British officers which happened recently is something which would not have occurred a little time ago and would not have occurred today but for the fanatical feeling which has spread in Egypt this year.

"As things are now, I say deliberately and with a full sense of responsibility that if the House does anything at this moment to weaken or destroy the authority of the Government as

it exists in Egypt you will be face to face with a very serious situation, because if the fanatical feeling in Egypt gets the better of the constituted authority of the Egyptian Government, you will be face to face with the necessity for extreme measures."

These remarks were made to forestall an attack upon the Government by John Dillon, Nationalist, but they did not prevent him from denouncing the brutal barbarism of the floggings and executions in Egypt. Four natives have been sentenced to death and eleven to flogging and imprisonment for the attack on the British officers, which resulted in the death of Captain Bull. According to the official version of the affair, five officers went into the fields near Denshawi to shoot pigeons, when they were surrounded by villagers, who took their guns away from them. In some way one or more of the guns went off, and four persons, including a woman, were injured, and a threshing floor set on fire. This infuriated the natives so that the officers decided to run to their camp, six miles away. The mob pursued, throwing clods and striking them with sticks. All were badly hurt and one of them killed before help arrived.

Macedonia

The disorders in Macedonia generally calm down during the summer until the harvest season. The principal feature of the situation during the past three months has been the remarkable increase, in numbers and activity, of the Greek bands, which have been reinforced by considerable drafts of Cretans and by volunteers from the Morea. Among the chief exploits of the Greeks have been attacks in force on fourteen Bulgarian villages. In some instances the villagers defended themselves successfully and drove off their assailants, but in most cases the bands effected an entry, and, after burning some houses and taking hostages, compelled the inhabitants to declare allegiance to the Patriarchate and to accept Greek priests and schoolmasters. By far the most important achievement of the Greeks, however, has been an attack in great force on a party of Vlach peasants escorted by forty Turkish soldiers on May 13. This has led to serious political complications between Greece and Rumania. The exploits of the Bulgarians within the same period have been comparatively insignificant. Their activity has been hindered partly by want of funds (the Greeks are liberally financed by subscriptions from abroad) and partly by internal dissensions, but chiefly owing to the smallness of their bands, the necessity of confronting the Greeks and Servians together, and the pressure of the Turkish troops, which have latterly shown a noteworthy increase of energy. In the Monastir vilayet the Bulgarian bands are computed to number about 150 men, while the Greeks on the warpath muster about 2,000. Attacks have been made by the Bulgarians on three Patriarchist villages of Nissi, Grumasi and Vrjani, and numerous isolated instances of retaliatory murders of Greeks have occurred. In general the Bulgarian bands have remained quiescent in compliance with orders from the committees, and in all the numerous engagements which have taken place between them and the Turkish troops the latter have been the assailants. A singular feature is found in the attacks made by Bulgarian bands upon Bulgarian villages in the Seres district, where the brigand chief Sandansky, the captor of Miss Stone, acts on his own account. The Servians have been singularly inactive thruout the spring, altho some large Servian bands are maintained in the northwestern districts. No bands of Vlachs exist, but in some of the Vlach villages a certain number of peasants have been allowed to bear arms to protect themselves against the Greeks. Moslem bands are still on foot, and numerous murders of Bulgarians have occurred. The operations of the Turkish troops against the bands have, on the whole, been attended with far greater success than hitherto, especially in the Perlepe district of Monastir and in that of Seres, where unusual energy and ability have been displayed by the respective military commanders, Saadeddin Bey and Ibrahim Pasha. On the other hand, the operations in the Salonika district have been conspicuously unsuc-

cessful. As usual, Turkish energy has been mainly directed against the Bulgarians. Bulgarian bands have been totally annihilated at various places. These repeated annihilations—there is no mention of prisoners or wounded—bear witness once more to the extraordinary heroism with which the Bulgarians fight to the last man, and also seem to illustrate the Turkish practice of despatching the wounded. The operations of the troops against the Greeks have not been characterized by similar zeal, and it was not till after the engagement near Grevena, already alluded to, in which 40 Turkish soldiers were either disarmed, killed or wounded by a strong Greek force, that the authorities departed from their somewhat indulgent attitude toward the champions of Hellenism. The Porte has now invoked the good offices of the Powers at Athens in order to prevent the despatch of armed contingents from Greece, but until the last few weeks there has been little to show that their presence on Turkish soil was other than agreeable to the authorities.

The Opening of Abyssinia

The mutual jealousy of the Powers has hitherto prevented the opening of the great African empire to the commerce of the world, and the railroad which the French were constructing from the coast to Addis Ababa, the capital of Abyssinia, was interrupted last year, supposably by the intrigues of Germany. But after the Algeciras Conference the matter was taken up by the three European Powers, France, Great Britain and Italy, and they have now come to an agreement and have made a treaty accordingly with Abyssinia. Italy has confidentially communicated the result of the negotiations to her ally, Germany. Russia and the United States, who both have sent commercial embassies to King Menelek recently, for the purpose of extending their trade in that country, do not appear to have been consulted. The agreement of the three Powers guarantees the integrity of the empire, the open door and commercial equality for all countries. The French will continue the construction of the railroad to the coast, but Great Britain and Italy will have representatives on the directorate.

Foreign Notes

The death of Chief Bambaata did not put an end to the Zulu war in Natal as was supposed it would. The natives show no disposition to surrender, and it is doubtful whether the present temper of the British troops would give them a good opportunity to do so if they were willing. The soldiers are exasperated by the outrages inflicted upon the bodies of white men which have been found. The warlike Zulus number 8,000 and whenever they are overtaken they charge the British lines with desperate courage regardless of their great loss of life. In an engagement on July 3d 350 natives were killed and on July 8th a band of Zulus was surrounded and very few of them escaped. None of them were taken prisoner and 547 were killed.——Fighting has occurred on the Turco-Persian frontier, where the Turkish troops have been seizing various points along the disputed boundary. A Turkish colonel who had advanced to occupy the Persian district of Sife Méltehave, south of Passvah, with 300 regular and 700 irregular cavalry, was attacked by the Governor of Pushtiku and repulsed with loss. The affair derives its importance from the strained relations between Russia and Great Britain on account of their clashing interests in Persia.——The Red Cross Conference at Geneva has concluded its work and the protocol containing the new rules for the amelioration of the evils of war has been signed by the representatives of all the civilized nations. In this conference, for the first time, China, Korea, Siam and Kongo were represented. The convention must be ratified before the end of the year, and for all countries failing to do this the old convention of 1864 will hold. No very radical changes have been made in the rules, as it was thought more important that these should be simple, well understood and universally agreed to rather than to run risk of making them ineffectual and impractical in actual warfare. The Hague tribunal will have the power to interpret the rules in time of peace.

The Battle Over the Railway Rate Bill

BY J. P. DOLLIVER

[United States Senator J. P. Dolliver is among a few members of the Senate who, from the time the Railway Rate Bill came over from the House, looked forward with unwavering optimism to its final passage, improved and strengthened by the long controversy in the Senate. He is a member of the Senate Interstate Commerce Committee, into whose hands it first fell; the colleague of Senator Allison and next-door-neighbor, as well as warm friend and admirer of Senator Cullom, the two veteran railway rate advocates of the Senate. He made one of the first speeches in the Senate on the bill and was in the front of the fight thruout, always looking forward. Obviously he is especially fitted to look backward now, as he does in the following article, over the battleground, and consider the victory that was won.—EDITOR.]

THE adjournment of Congress gives the American people an opportunity to consider the work of the session and to pass judgment upon what has been done. It is obvious that the session just closed will be regarded as historic, not only on account of the laws which have been enacted, but on account of the new frame of the public mind, which has found an unexpected interpretation in both Houses of Congress.

For nearly a generation, following the Civil War, the American people were infatuated with the questions which concern money making and the material enterprises associated with commercial prosperity. With one accord they set themselves to the task of rebuilding the waste places and restoring the losses incident to civil strife, and it cannot be disputed that their efforts have been rewarded by the most ample success. Never before in the history of the world has such a step been taken in the accumulation of property and the profitable organization of business. The universal motto has been "Make money," and the tendency has grown to add to it the watchword of greed in all ages, "honestly, if you can—but make money."

It is a hopeful and encouraging sign of the times that in the midst of unexampled commercial and industrial development the American people by a spontaneous movement, which illustrates the moral health of the community as a whole, have summoned the entire marketplace to the bar of public opinion to answer whatever questions may be asked as to the methods and practices of the business world. At this hour every organization which deals with the enterprises of commerce and industry is under cross-examination. Nor will the investigation be ended until every form of fictitious and fraudulent dealing has been driven into the light of day.

The new statute amending the interstate commerce law is only one of many illustrations of the coming ordeal thru which our great corporations must pass in order to make their operations acceptable to the eighty millions of people who are at once their customers and their judges. The defense of the law of property, and especially of corporate property, is impossible, unless there can be introduced into American business methods a strict moral integrity which shall cheerfully respect the rights of the people and the laws of the land.

One-sixth of the national wealth is represented in the American railway system, a system no longer divided in interest, but joined together by innumerable legal devices into a compact organization. This gradual amalgamation of the transportation lines—much of it accomplished in violation of law and often accompanied by arbitrary additions to the sum total of the stocks and bonds upon which the public is expected to pay dividends and interest—was almost unnoticed by the people until President Roosevelt, acting upon the advice of Attorney-General Knox, brought the Northern Securities Company into the courts of the United States. That litigation, of vast importance in itself, was of still greater consequence, because it brought the people of the United States face to face with an intolerable situation—a railway system

united, compact and aggressive, with no effective machinery for protecting the rights of the community against the abuses of its management.

The President lost no time in calling the attention of Congress to the fact that the tribunal created, twenty years ago, for the regulation of railway rates had become helpless and impotent to deal with the question. It had fallen into contempt and disrepute, not because it was incompetent, but because the law fell short of clothing it with the necessary powers to transact the business for which it was created. It had the power to condemn a rate complained of and to bring a lawsuit to enforce its orders to cease and desist; but it had no power to make an order substituting a proper rate for the one condemned, and therefore its orders became futile and of insignificant value.

The agitation for railway reform went straight to the proposition of taking this discredited railway commission and clothing it with the necessary authority to sit in judgment upon a disputed railway rate, and to follow up its judgment with an order, having the effect of law, putting in operation the rate found to be just and reasonable. It is an interesting thing to note that this demand fell upon the ears of a Congress apathetic and indifferent to the whole subject, partly because it did not understand it and partly because of the overgrowth of railway influence in the commercial and political life of the nation.

Shortsighted persons accused Congress of corruption, and the Senate of the United States was made the subject of calumny and vituperation little short of a national scandal. Yet, within a single year, it has been demonstrated that the well-considered judgment and purpose of the American people finds as complete an expression in the attitude of Congress as had any period in our national history. When the subject was taken up in earnest in both Houses, it was dealt with in a way thoroly satisfactory to the public interests involved; the petition of the American people was answered. They have received all that they asked for and a good deal more.

The new law is applicable not alone to railroads, but to all carriers engaged in interstate commerce. The private car system can no longer practice the arts of extortion upon the shippers of perishable commodities without redress. Connecting railroads can no longer be lawfully used to create oppressive commercial conditions by refusing to make joint rates applicable to thru shipments. Every account book, including every memorandum kept by the carriers, is brought under the eye of the national Government. The Commission is authorized to establish a uniform system of railway accounting, so that secret practices hitherto so fatal to fair dealing will no longer be practicable unless the railways are content to adopt a felonious scheme of fraudulent bookkeeping to cover up illegal transactions.

But more important than all these things is the simple provision of the new law making the Interstate Commerce Commission the judge of the reasonableness of railway rates which are subject to complaint, with a definite jurisdiction to determine what will be a just and reasonable rate to be observed for the future. There has been much loose thinking and wild talking and writing about what has been described in some newspapers as the "President's surrender to the railroads." The truth is that the President has surrendered nothing which is essential to the operation of the law with which his name will be associated. The most radical agitator never contended that the orders of the Interstate Commerce Commission could be made conclusive. If Congress itself exercised the power of fixing a railroad rate every such act would be subject to attack in the courts, and if the rate fixed by Congress were found by the court to be unjust and oppressive to the carrier the act fixing it would be declared void by a decree in equity.

Under the new law the orders of the Commission will not have greater force than an act of Congress, but they will have the same force, and the attitude of the courts toward them will be the same. The power which the Commission exercises under the new law, taken in connection with the law itself, is the power of Congress over interstate commerce; neither less nor more. And the jurisdiction of the courts over the orders of the Com-

mission is as well defined in our jurisprudence as the walls of the chamber in which the Supreme Court sits.

The so-called Allison amendment was introduced, not for the purpose of enlarging the jurisdiction of the court, but for the purpose of clearly recognizing it, and whoever has obtained the opinion that the Supreme Court of the United States is likely, under this law, to spend its time weighing considerations of an administrative detail with a view of revising the discretion which the law confides to the Interstate Commerce Commission will be rudely awakened from such a dream when that great tribunal takes up its first interstate commerce case under the new law.

The court, in the very nature of our institutions, is incapable, either directly or indirectly, of exercising the power over interstate commerce which the Constitution has conferred upon Congress. Therefore, if the law provided that every decision of the Commission should be taken to the court to have its reasonableness inquired into, with a view to substituting the judgment of the court for the discretion of the Commission, such a provision would be ignored by the judicial department of the Government as alien to the function and disposition of the courts. So that nobody interested in the efficiency of this law need have any fear that it has been weakened by any broadening of the jurisdiction of the courts over the Commission's orders. Such a thing has not been done, and if it had been the courts themselves would have made short work of it. In practical operation every order of the Commission will be obeyed by the carriers affected by it, and no suit will ever be brought to vacate an order which does not contain the allegation that the decision complained of is so unjust and unreasonable as to be destructive of property rights in a constitutional sense.

The new law contains two provisions which will probably receive the further attention of Congress. One of them is the prohibition against carriers engaging in the transportation of merchandise which they produce themselves. Whether the provision in the new law on this subject sufficiently guards against the abuse incident to the railway ownership of mines and other enterprises will be clearer when the report of the Interstate Commerce Commission's investigation of the coal roads is made to Congress. In the law, as it finally passed, this provision was made applicable to railways only, thereby avoiding the absurdity of denying to pipe lines the right to carry their own oil. The question became important in connection with complaints that the railways were operating coal mines in competition with their patrons, thereby putting the independent coal corporations at a fatal disadvantage. Whether the provision on the subject contained in the new law will fully correct these evils is doubtful, but the disposition of Congress to confine the carriers to the business of transportation is so distinct that whatever is necessary to be done further in the matter will be done.

The provision of the new law in relation to railway passes is interesting chiefly as an evidence of the improved order of things which recognizes the injustice of this species of favoritism and discrimination. The railway pass system had died a natural death thru the agency of public opinion before the subject was taken up in Congress, and, while the provision on the subject contained in the new law is a fairly adequate interpretation of the public demand, it will undoubtedly receive further attention at the hands of the law-making power. It signalizes the tendency of the times to require the corporations engaged in transportation to confine their activities to that field. It is not the purpose of this step forward in the reform of railway abuses to cripple or harass the great corporations who are engaged in the interstate carrying trade. The friends of the measure confidently anticipate that within five years it will receive from the business community of the United States the same tribute which Sir William van Horne has paid to a similar statute recently enacted by the Dominion Parliament, the operation of which has proved of incalculable advantage both to the railways and the people of Canada.

FORT DODGE, IOWA.

The Real Senator Tillman

BY GILSON GARDNER

WASHINGTON CORRESPONDENT OF THE NEWSPAPER ENTERPRISE ASSOCIATION.

IN a truly representative government it is necessary that the honest farmer be represented; hence Benjamin Ryan Tillman. The Senator from South Carolina is honest, and, incidentally, is a farmer.

In modern politics honesty seems to be an achievement. Until the contrary is proved, a politician is assumed to be dishonest. But a man who has had a fine chance to be dishonest, and comes out of it poor, is assumed to be less dishonest than the average. Tillman was Governor of South Carolina, and established the system by which the State dispenses all alcoholic beverages. He came thru the ordeal without a taint of graft. That helped to win the public's confidence.

Since then Tillman has served eleven years in the United States Senate. Again the opportunity, and again the ordeal successfully passed. He has not been a model statesman, but nobody questions that he has been honest. His voice and vote have been consistently against graft. Often he was little more than voice—loud, rasping and only crudely eloquent—but there was no doubt about the meaning—for whom and for what he spoke. The public's confidence increased.

Tillman represents the honest farmer in revolt. But with the recent quickening of the public conscience, his constituency has swelled to include some honest city people. With the issue of honesty against dishonesty pressing to the front, the agricultural character of his calling has become of secondary moment. He has come to be the champion of independent miners of coal, of consumers and shippers, of thousands outside his State and calling, who have sought representation against the combinations of power and greed.

Historically, Tillman is a monument to the Populistic uprising of twenty years ago. Beginning in the granger agitation, in 1886, which took the form, in South Carolina, of a demand for higher industrial and technical education, the farmers rose in political revolt. The chief insurgent was Tillman. He was the boldest and most radical of them all. His speech was fiery. He arraigned and denounced, and his utterance was like that of a frenzied prophet.

The farmers applauded, and elected him Governor.

From the plow to the Governor's mansion, at the age of forty-three; that means political revolution. What went down? Tradition, social and hereditary prestige, the vested interests, the influence of the railroads. All these were arraigned on the other side. A man of the common people had overthrown the oligarchy by which the State of South Carolina had been governed since the founding of the Republic.

Other men were brought into power and prominence on the wave of Populism; but they went out with the backsweep. They were the demagogs and time-servers. Tillman is neither. In the office of Governor he developed some unexpected qualities. Radical and intemperate in speech, he proved sane and practical in administration. He constructed. He established the technical and industrial schools. He levied the taxes on the liquor trade and the fertilizer trust. He whipped the rascals out of office and secured a fairly decent Legislature. He refused to take bribes, and was not to be intimidated. He was honest and fought to stay so.

Tillman, the Senator, is better known for his intemperate speech than for his constructive statesmanship. When the gentleman from South Carolina opens his mouth the Senate is wont to hold its breath, and to get ready to dodge. He spares nothing—not even the time to choose his words. They are often homely, redolent at times of the stable and pig-pen; but they are not without a pic-

turesque force and vigor. He is like a Cyclops hurling rocks. Occasionally it is necessary to get from under.

It was in one of these "speaking parts" that Tillman made his first appearance before the country at large. Addressing himself to the policies of the Hon. Grover Cleveland, then President of the United States, the farmer-Governor of South Carolina confided to his State convention his belief that Cleveland was "nothin' but a big bag of beef, nohow." Adding, "I wish I had him here; I'd stick a pitchfork in his old fat sides."

This was putting a new point on political criticism, and Tillman awoke to find himself in the spot-light of publicity. Which was pleasant. There is something about the spot-light and the center of the stage which even reform statesmen cannot always resist. After his first speech in the Senate—a speech on the subject of Cleveland and pitchforks—Tillman received 40,000 letters. That bale of letters is still treasured in storage as one of his dearest mementos.

Senator Tillman.

But the most spectacular performances of the Senator from South Carolina are not premeditated. Tillman is a violent man. He is subject to attacks of uncontrollable rage, at which times he is to all intents and purposes quite irresponsible. It was in such a moment that he sprang over two desks and grappled the throat of his colleague, John L.

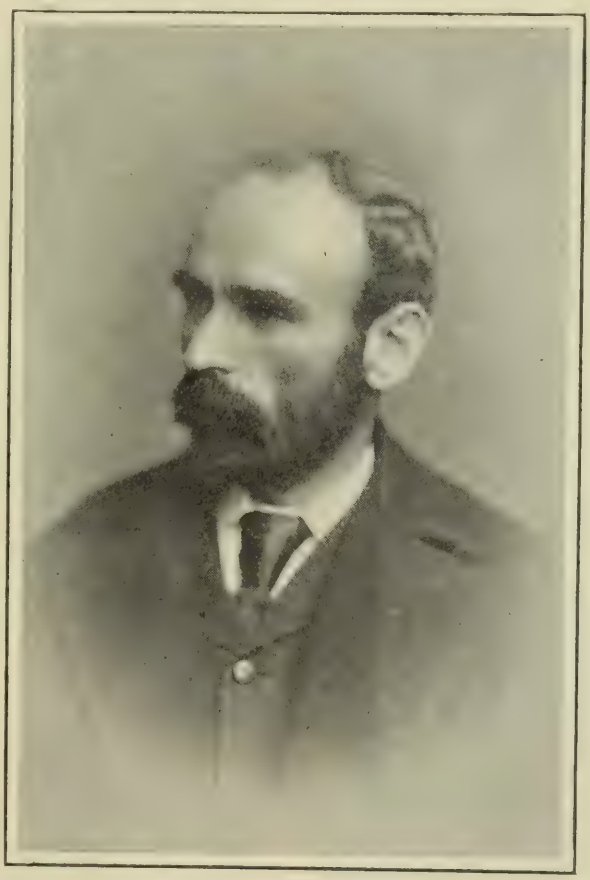
McLaurin, and it is into such fits of frenzy that he has often been thrown by the thoughtless or mischievous flaunting of the negro question, by some Northern Senator, to whom the problem is a purely academic one. It is then Tillman becomes savagely picturesque. Out of his seat, and halfway up the middle aisle, his square jaw set, and the one eye burning like a hot coal, he is every inch a menace. His words become like the barking and snapping of a dog. The seamed visage is now more drawn, the lips curl into a sneer, while his whole frame trembles with emotion. If an artist could reproduce that moment, adding a red bandanna handkerchief over the forehead, a cutlass in the hand and a dagger between the teeth, he would have a perfect pirate boarding the merchant ship.

These outbreaks by Tillman are chronicled quite faithfully by the daily press. They make good "copy." The less spectacular doings of him and other public men are less known for the converse of the "copy" reason.

Tillman is not a pirate. He is not a cannibal; nor even a curmudgeon. As a matter of fact he is an idealist and poet. Real reformers are either poets or fanatics. A man touched with a monomania becomes a power along the line of his mental obliquity, if only by reason of his concentrated persistence. The only other type with courage to wage aggressive warfare against a world of wrong is the Don Quixote—the poet in action—the man who dreams great deeds and acts his dreams. And so it is not a cause of wonder when we find that Tillman's real passions are his roses and his library of the poets. In front of the big white plantation house is a garden where he spends all his leisure time, a garden containing hundreds of varieties of roses—new and unheard of products of grafting, crossing and cultivation—the work of his hands. And in his library are scores of volumes of verse. For the man of wrath is a man of sentiment. He is a sentimentalist in action. He is a dreamer fighting for his dreams. He is a knight charging the hosts of evil—a Cyrano de Bergerac, with a blade ever ready for the shams of the false and cruelties of the oppressor. He is a knight who fears not; who is bold, aggressive, gentle and true. In short, as we have said, he is a poet.

Tillman's hardest battle is with himself. That evil genius of a temper is ever at his back. He tries to curb it. He tries to file the rough corners from his speech. But it is not easy. But he is always ready to make amends. Many is the harsh term he has withdrawn, and many the raw phrase that has been stricken from the *Record*. He does not harbor grudges. He likes his colleagues, and is liked by them. He has the saving grace of humor. He fights fairly and tries to deal justly even with an enemy. Nothing more magnanimous has been seen in recent public life than the voluntary acknowledgment Tillman paid to Roosevelt of the latter's services in the passage of the Rate Bill. With a fresh injury rankling in his thoughts, and the memory of an old one still vivid in his mind, it must have taken a struggle to give the victor so generously of the spoils of glory. "I did not think I could be surprised in Tillman," the President remarked. "But I am." Which is first-hand testimony to a regrettable fact that he does not know Tillman as well as he should.

In his twenty years of public life Tillman has grown. His thought has widened, and he has gained in charity. His radicalism has been instructed and his temper chastened. But if he lives to be a hundred and continues in the Senate, he will continue its most unique and interesting figure.



WASHINGTON, D. C.

Topics in London

BY JUSTIN McCARTHY

THE short Whitsuntide holidays are over—holidays which this year sent wandering out of London the largest number of pleasure seekers ever known to have left the metropolis at such a season—and the Houses of Parliament are once more settled down to their work. For the House of Commons that work is still principally the Education bill. The Government, we now learn, are endeavoring to make some arrangements by which to secure the passing of this measure within something like a reasonable time. The Education bill, altho clear and direct in its main purposes, is yet so complicated and so various in all its practical arrangements that it calls up opposing interests in the details of its every clause and provokes lengthened discussion by almost every sentence it contains. The Government now begin to believe that it will not be possible to pass it during the course of this session, and that the most satisfactory plan will be to bring the session to an end at its ordinary time and then have an autumn session in which to finish the Education bill and dispose of any other business remaining to be done. Such an arrangement as this would certainly be in keeping with the growing inclination that Parliament should arrange its sittings so as to get thru its work in the months of spring, of autumn and of early winter, and leave the best part of summer and the early autumn altogether free from the indoor toil and labor at Westminster.

The Late Michael Davitt.

The Education bill has thus far stirred up a strong amount of hostility to the Government alike among Churchmen and among Non-conformists, who, at the same time, are by no means allied powers, but are actually hostile to each other and oppose the Government on entirely different principles. The Government, however, hold such an overwhelming majority in the House of Commons that their main trouble is to find time for getting thru the mere mechanical work of passing the clauses of their measure, and are not in the least distressed by any dread of finding themselves left in a minority. An amusing illustration of this condition of things may be found in the fact that several times lately there has been tumultuous exultation on the side of the Opposition when on some particular division the Ministerial majority has been brought down to 150 or thereabouts, a majority which in any former Parliament would have been recognized as a splendid Ministerial triumph. The Irish National party, under the leadership of Mr. John Redmond, have, as might be expected, maintained an absolutely independent position in their action with regard to the Education measure. They have supported the Government wherever they believed that the purpose of a clause was to render justice to the principles of the religion which is that of the great majority of Ireland's people and to other creeds as well, but they firmly opposed other clauses which seem

J. E. C. Bodley.

to them calculated to exclude religious teaching from public schools altogether.

John Redmond, John Dillon, Edward Blake and T. M. Healy have especially distinguished themselves in recent debates. A friend of mine, an influential Protestant clergyman and in politics a strong Conservative, has written to me within the last few days a letter in which he says: "How splendidly most of your party have opposed the attack upon religion which the Government have made. I would give a good deal to put the clock back and hear Healy's speech." My friend, however, must have seen that the Irish party supported with equal earnestness every provision in the measure which seemed to them to maintain the interests of religion and popular education as well. I cannot remember any Parliamentary measure which caused so many divisions of opinion among the various political parties in the House of Commons. The Opposition thus far have made but a poor show, and the strongest antagonism to the bill has come from the British Non-conformists.

The death of Michael Davitt created a profound sensation thruout England, and not only among those who were in sympathy with his national cause, but also among those who were entirely opposed to his political principles. I can hardly call to mind any other instance equally remarkable of a public tribute of admiration paid by all parties and sections to the representative of a political cause which is still exciting, and is for some time likely to excite, so keen and passionate a controversy. That is the fact connected with Davitt's death which I especially desire to impress just now on the minds of my American readers. I was a personal friend, as well as a political associate, of Davitt during a great many years, and have ever looked up to him with the fullest admiration for his noble character, his superb disinterestedness and his absolute devotion to the cause of his country. I retained his friendship to the very last, and quite lately he came to visit me and mine in my retirement. But at present I do not desire so much to offer my own tribute to the memory of Michael Davitt as to record my satisfaction at the manner in which his death was received by the vast majority of those in England who had never felt any sympathy with the Irish national cause. The leading English Conservative and Unionist journals, London and provincial, seem to have rendered full and willing justice to Davitt's exalted character, great intellectual capacity, utter unselfishness and ready sympathy with every movement for the benefit of humanity. I can well remember how, during the time while Davitt had a seat in the House of Commons, he was thoroly appreciated and admired by English Conservatives and Unionist members who had no manner of sympathy whatever with his cause, but who were deeply impressed by the sincerity, the disinterestedness and the simple natural eloquence of the man himself. It was one of Davitt's most remarkable characteristics that without any effort on his part thus to impress his political opponents he ever did impress them with the conviction that in him they saw the living type of a truly sincere and high-minded patriot.

A great sensation has been created by the announcement that Sir Edward G. Clarke is about to resign his seat in the House of Commons for the City of London. He was elected to that seat at the last general election with Arthur James

Balfour as his colleague. Sir Edward Clarke has made the announcement himself, and he assigns as his reason for retirement that his state of health does not allow him to continue in Parliamentary life. There is, however, a very general and indeed universal belief that Sir Edward Clarke has been made a victim to the dictatorship of Joseph Chamberlain. Clarke is a member of the Conservative party and represented for many years the constituency of Plymouth in the Conservative interest. When Lord Salisbury's second Government came into power in the August of 1886 he was made Solicitor-General, and being then only Mr. Clarke he received the honor of knighthood. He declined, however, to accept the same office when Lord Salisbury formed his third administration in 1895, and it was then understood that his reason for this course was because, altho a thoro and sincere Conservative so far as political principles are concerned, he was at the same time a Free Trader, and did not believe he would be allowed to get on satisfactorily under the rising influence of Joseph Chamberlain, who had become a convert to the financial creed of Protection.

Like most sudden converts, Chamberlain is a fanatic for his new creed, and he has exerted himself to get rid of every one who does not meekly submit to him on that question. Clarke is one of the most distinguished members of the legal profession in this country, and one of the most brilliant pleaders, astute lawyers and skilful cross-examiners at the English bar. He has taken a leading part in some of the most famous trials carried on during his time. When he entered the House of Commons he at once made his mark there, and was recognized by all as one of the most powerful debaters in the representative chamber, and indeed not merely as a great debater, but as a genuine Parliamentary orator. His manner is impressive, his voice strong and sweet and many-toned, and whenever he arose to address the House he was sure to find the benches crowded on both sides of the chamber. I had a seat in the House during many years of his Parliamentary career, and I came to know him well personally and to be charmed by his manners, his wide and varied culture and his thoro sincerity. He had many artistic tastes, was a lover of literature and the drama, and at every great theatrical performance in London he was sure to be found among those who attended on the opening night and on other nights also. Such a man must be a genuine loss to the House of Commons, and the regret felt at his disappearance from public life will be only all the greater if its cause should be declining health. But he is not an old man as we regard age in our days, for he was born in February, 1841, and those who have seen him lately say that he does not seem to be suffering under the weight of years, and in any case that the effect of those years must have been making itself felt somehow at the very recent period when he stood as a candidate and was returned to Parliament once more at the late General Election. The opinion, therefore, which prevails everywhere is that Sir Edward, having found that he could not get on with Mr. Chamberlain, now the actual leader of the Conservative Opposition, and being unwilling to give any trouble to his party by

Sir Edward Clarke.

the appearance of disaffection, felt bound to make some graceful excuse for his retirement and thus suddenly discovered that he was growing old. The City of London, however, which as a constituency is completely under the Chamberlain dictatorship, promptly accepted Clarke's resignation, and has already chosen a man, a comparatively obscure personage, whom they propose to elect as his successor. In the ordinary course of things it might be taken for granted that some intelligent and independent Conservative constituency would offer to Sir Edward Clarke an opportunity of finding another seat in Parliament, but I fear that the influence of Joseph Chamberlain will prove too strong for any such offer in the present instance, and I doubt whether even if the offer were made Sir Edward Clarke could now be induced to open another chapter of Parliamentary life.

"The Church in France" is the title of a volume just published by Messrs. Archibald Constable & Company, of London. The volume contains two lectures delivered at the Royal Institution by Mr. John Edward Courtenay Bodley, an English scholar, writer and thinker, to whose literary productions I have already directed the attention of my readers in THE INDEPENDENT. Mr. Bodley, I should say, is not a member of the Church in France, and is dealing with his subject only as a student of history. The author says in his preface:

"It was pointed out to me that altho many people in England took a lively interest in the religious crisis in France, there was no book, large or small, in the English language to help them to understand the constitution of the Concordatory Church, now disestablished, or to follow the phases of the controversy, which has by no means come to an end with the passing of the Separation Law of last December."

The whole subject is, in fact, one of the deepest interest to all who follow the workings of living history and it is at the same time one which the mere readers of newspapers must find it impossible to understand in all its details. No one could be better qualified than Mr. Bodley to make the full meaning of the crisis clear to the whole English-speaking public in the New World and in the Old. Mr. Bodley is a Corresponding Member of the Institute of France, and has indeed passed a great part of his life in that country and has also been a traveler far and wide, and has studied the United States as well as British North America and South and East Africa. The volume of lectures is, above all things, lucid in its style, and makes even the most complicated passages in the history of the Church of France and its relations with the Church of Rome perfectly clear to the understanding even of the ordinary reader to whom the subject is quite new. I should say also that it reproduces the text of all the important documents and laws which bear upon the questions it is explaining to the public. The literary style of the author is full of charm and would of itself secure the absorbed attention of every intelligent reader who opens his pages.

The book comes to the English public at a very appropriate time, when many of our cities and towns can see the immediate evidences of the French religious crisis in the numbers of French priests and nuns who, expelled from their own country, have found a refuge here. The whole subject must have created a deep interest in the United States, and I can cordially recommend Mr. Bodley's lectures to American readers.

LONDON, ENGLAND.

A Thought

BY MINNIE FERRIS HAUENSTEIN

I'd rather be a slave and have a friend
  Than regnant Cæsar, doomed to live alone;—
Or be an island in a land-locked bay
  Than great Gibraltar on its rock-bound throne.

Far, far above the splendid pomp of kings,
  And better than the pride of wealth to me,
An eye that kindles as it meets my own,
  A hand that warms my heart with sympathy.

BUFFALO, N. Y.

My Life in Prison

BY URBAIN GOHIER

[The well-known enemy of great standing armies, the author of that strong book, "The Army Against the Nation," writes us as follows from the Santé Prison, Paris.—EDITOR.]

FOR the first time in my life I find myself in prison. It is not a pleasant place. I have appeared a dozen times before the courts of my country, not that I have ever been guilty of a felony, but because it is my habit to profess opinions which are not to the taste of the Government. There are so many persons who are always ready to bow servilely to those in power that they would be willing to change Titus or Marcus Aurelius into low tyrants. It is necessary that good citizens, from time to time, sacrifice themselves to the demands of a political opposition. This keeps our rulers within certain bounds of conscience and prudence. It is a rather thankless task, however. Tho I have been often before the courts, as I have just said, I had always heretofore been acquitted, because I found no difficulty in making the jury understand the morality, the patriotism and the disinterestedness of my labor. But at last, after twenty years of militant journalism, I have met defeat and been condemned. My personal defense produced its usual effect, but I had beside me twenty-seven co-accused, whose presence and various ways of defending themselves destroyed the impression of my own vindication.

Our crime was that we had favored in a manifesto, addressed to the new recruits and future soldiers, anti-military and pacific ideas. We condemned military service, because general and obligatory training under the colors and barrack-room life are the origin of the destruction of the physical, intellectual and moral fiber of our nation. We advocated pacific ideas, because war in itself is atrocious, and because our country is not in a position to carry on a victorious campaign. Tho the aim of this act was really patriotic, I was charged with a lack of patriotism. Such is the justice of men and their logic. I am descended from one of the oldest country families of the purest French provinces, Touraine and Berry, and I was declared to be an unpatriotic Frenchman by a Hebrew judge, who was recently naturalized! This detail is not the least curious feature of this trial. Some five years ago 500 groups of young men, natives of ten different European nations, united in proposing my candidature for the Nobel peace prize. They held that, during the present generation, no propaganda for the maintenance of peace in the Old World had been more effective than my own. I did not win the Nobel prize, but I did get one year of prison!

The jail in which I am confined is under the authority of the Minister of the Interior, M. Clemenceau, who was a member of the staff, at the same time as myself, of the *Aurore,* during the Dreyfus affair. In that formidable crisis, in the midst of daily trials and dangers, especially after we opened our columns to Zola for his arraignment of the general staff of the army, we, Clemenceau and myself, stood side by side and met the brunt of the battle. We lived thru tragic moments then. But now that my former companion in arms is a member of the Government, he needs the help of the army. He has had to oppose with bayonets the irritated Catholics and the revolutionary workingmen. Consequently, Clemenceau must make the military class forget how roughly he handled them a few years ago in my company. What better means can be found than keeping me in prison? But as in 1870, when he was thirty years old, more or less, my eminent ex-collaborator neglected to take up arms against the invader, my captivity furnishes him a fine occasion to manifest his patriotism. So I am left in prison. But it is no joke.

One morning last winter, before sunrise, while I was sleeping the sleep of the just, the police came and woke me up; I was given a few minutes to dress, and I was then hurried off on foot, thru the empty streets of Paris, to the central

lockup. I was led from desk to desk, from jailer to jailer; I was searched even down into my socks, felt all over to see that I had nothing concealed on my body, measured, cataloged, entered with a number on several registers, relieved of what was in my pockets, of my necktie and of my braces, and then shut up in a dirty cell. Since then I have twice been brought back to this same spot in order to testify in other cases where my presence was necessary; so I know it well, and I can swear that it is one of the vilest places in all Paris. The walls guard the trace of the passage there of thousands of criminals and vagabonds; air and light are lacking; the lungs are oppressed by a damp heat, with nothing done to prevent the escape of noxious exhalations, while fleas swarm everywhere. The heavy wooden stool is fastened to the wall by a short chain to prevent its being used as a weapon against the guards. A wooden spoon, the only kitchen utensil, is used to fish out of a bowl morsels of food that a starving dog would refuse. When I left this charming spot and when I had to go back to it for the lawsuits just mentioned, I was carried thru Paris in a "Black Maria," in the company of hooligans from the lowest classes of society.

The judge who charged the jury declared that my propaganda against military vices and massacres surpassed in evil the crimes of common law criminals. By urging young Frenchmen not to spill the blood either of their fellow countrymen in home troubles or of their human brothers in foreign lands, I had committed a felony more reprehensible than that of house-breaking or assassination. It was but natural, therefore, that I should be treated like an assassin and robber. Did not the Inquisition punish heresies with awful sentences pronounced in the name of orthodoxy? Was I not a heretic, since I separated myself from governmental orthodoxy in certain essential matters? Is it not the duty of the French Republic to defend itself, just as does the Roman Church, against new ideas? Is

Prison de la Santé, Paris.

not the French Republic the faithful friend, ally and money-lender of the Czar and his autocratic régime, and consequently authorized to profess the same maxims and to practice the same methods of government as the Russian Autocrat? And, after all, is not the prison the logical continuation of the school-prison and the barrack-prison, where every French boy consumes his flowering youth, where he sees nothing of the real world till he is suddenly thrown out into it?

The Republican Bastille in which my distinguished friend Clemenceau leaves me bears a rather ironical name—Prison de la Santé, or, in English, Health Prison. And it is also situated in the Rue de la Santé. This name is probably given to it in order to lead the captives to imagine that they are undergoing a cure, that of their lost illusions! The rules governing prisoners of my category, viz., "political prisoners," do not subject us to rigorous discipline. A cell ten feet by twelve aired by a transom, a table, chair and an electric light make up the chief objects of furniture. Three hours a day, divided in two, are given up to a walk in a little court where are some sickly trees. It is permitted to receive in a public room a few friends, whose names have been passed upon by the police authorities. All letters received and written are read and viséd. Each visit and each letter received or sent is registered. No letter may contain criticisms of the prison administration, the judiciary, the police, the ministers, public men, and, in general, the constituted order of things. But most of these difficulties are gotten over by visitors carrying out in their pockets anything that the censor might object to. Nearly all newspapers may be read, tho a few are proscribed. In the cell you are kept for sixteen hours without a break, but you are free to kill the time as best you can. An ordinary criminal is forced to work, but we political prisoners are masters of our own time.

My companions in misery are fourteen workingmen, most of whom are secretaries of labor unions, who are imprisoned for the same reason as myself. They represent the various varieties of "revolutionary socialism." They have hopes in the future city, where property of all kinds and all created riches will be held collectively, where each will work according to his faculties and will consume according to his needs, where the greatest pleasure of every human being will be to contribute to the happiness of others. After having been shut up together every day for several hours either in the court-yard or in the common room, they begin to see that there must be no exaggeration of their theories, and that, if life in common has its good sides, it must not be carried too far. They perceive that there is some friction, especially among persons of worth and energetic character. These men, on the whole, are very fair representatives of our working classes, tho they are an élite, having been chosen from their respective unions for this demonstration, that is, the signing the manifesto of which I spoke above. They are all intelligent, eager to learn, full of hastily acquired ideas which are badly digested, great readers, ardent reasoners, liking politics, without the practical sense of their German and Anglo-Saxon comrades, kicking against all party discipline, passionately fond of discussion for discussion's sake—in a word, they are an exceedingly interesting body of men.

During the hours we are together one of them gives the others a music lesson, and I do the same thing for English. The upper classes of Paris, who are so terrified by the very thought of men of this sort, would be surprised to hear these terrible "revolutionists" singing like children the fables of La Fontaine to easy airs, where the words are:

> Let us laugh and let us sing,
> Dancing in a fairy ring.

or, perhaps:

> Joe Pugh, the dunce, comes late to school,
> Grins, laughs and acts just like a fool;
> So on the stool he has to stand,
> Fool's cap on head and book in hand.

When you are in your cell you would like to work. Sixteen hours of continuous solitude every day, within four walls, with no view of the outside world, would seem to force one to meditation. Friends who have never tried it said to me that I would find it all right and that I would accomplish a lot of good work under those circumstances. But such is not the case. Without good air, and de-

prived of sunlight, without contact with nature or man, in an isolation which is not silent, for a thousand inopportune and irritating noises break in upon you even thru that small window — under such conditions the brain will not work, or at least mine will not. About all one's head is equal to is the thinking over and the arranging of old ideas or the sketching of future plans. Spontaneous and original production is out of the question. It is my habit to sit down to write only when my work is well arranged in my head, and my work is arranged in my head only when I walk in the street, when I am rolling along on a bicycle on the highways, when I am strolling in the woods — that is to say, when I am among the crowds of men in a city or alone with nature. Seated, surrounded by four naked walls, my brain cells rest inert and sterile. It is even difficult for me now to find for an idea long in my head the exact and striking expression, which ordinarily comes to me immediately. In a word, the modern prison, like all "civilized" inventions, is simply a refined hypocrisy of the cruelties of the Middle Ages. The jailers of the past struck brutally at the physical side of our animal nature, tortured it or mutilated it. The jailers of today attack the intellectual personality of their prisoners, which is far more sensitive and precious. They strive to diminish it, to mutilate it, to extinguish it by anemia and depression of spirits.

So, as you cannot think for yourself in a donjon, the only thing left to do is to live on the thoughts of others. Therefore, I have been reading, and reading all the time, till my eyes have grown weary. I have found my old classics unchangeably beautiful, like the marbles of their age. With modern writers, I have experienced a series of disappointments. Fifteen or twenty years ago they enchanted me, but now most of them seem to me greatly overrated. I say nothing of contemporary authors. One of your magazines published recently a very true study concerning the ravages which journalism has made in literature. I have also been running over a large number of American novels, in the hopes of finding something worth translating, for translating is the only kind of work suitable to the debilitated brain of a prisoner. But I must say that I have failed in my search. The readers of THE INDEPENDENT know already what admiration I have for the tremendous vitality of the American people. But the literary product, in which I include the dramatic, of the United States, has always astonished me by its insignificance, the poverty of its psychology and its lack of sincerity. I ought to add that my hunt was checked in the case of certain volumes which appeared to rise above the dead level, by the abuse of dialect, which renders translation next to impossible.

But this American reading has had at least one pleasant effect on me. These tales have carried me back in my mind's eye to my tour thru the United States in the year 1902. The imagination is the grand resource of the captive. Behind my bars, where I have not been able to catch a glimpse of the May sun, where I get only a feeble reflection of the sky, where the effluvia of spring has not been able to penetrate, I have spent whole hours together seeing once more, with closed eyes, the Yellowstone with its bears, its eagles and its geysers, the Yosemite, the Grand Cañon, that delicious San Francisco now a ruin, and that paradisiacal university at Berkeley, where the cottage of the professor of French was buried in roses and gigantic geraniums, which seemed the best retreat possible for a scholar of my sort, after a life of battling.

Another thing in which, according to the legend, prisoners find amusement in is the taming of mice and spiders. But this prison does credit to its name—it appears to contain no vermin. In this province my only occupation is the feeding of a colony of sparrows, those Parisian sparrows, impudent, quarrelsome, noisy, so popular in our city probably because they so resemble the character of the citizens! My guests bring with them all their neighbors, and they are so many about my window and keep up such a chirping at the first sign of day that they interrupt my sleep. This little episode seems to symbolize my life's existence up to the present, and for this it is that I touch upon it. My fellow citizens, in whose favor my efforts of the past twenty-five years have considerably modified

many social imperfections, show me about as much thankfulness as these early morning sparrows of this my prison-house; and this suggests the question whether it is really one's duty to sacrifice one's pleasures and the happiness of one's family in order to promote the progress and welfare of the thoughtless and ungrateful crowd.

At the moment of writing these impressions France is engaged in electing her Deputies for a period of four years. That is to say, the care of the public fortune has been causing for the past two months a great tumult of bidding and outbidding on the part of candidates. This event will probably have some influence on the duration of my captivity. When the new President of France was inaugurated last February he pardoned, as is customary, some five or six hundred criminals. But I was kept locked up, because I know too well the misdeeds of so many of the politicians of the day, because I show too much ardor in unveiling their shortcomings and because they are more tranquil with me muzzled during an electoral campaign. My temporary suppression is a sort of rule with the Government. In 1902 M. Waldeck-Rousseau, then Prime Minister, bought the journal of which I was editor-in-chief. In 1906 M. Georges Clemenceau keeps me in prison, which obtains the same result at less cost.

Several years ago, at the most burning moment of the Dreyfus affair, M. Cavaignac, then Minister of War, proposed to the Government the arrest of M. Clemenceau and myself, with other "Dreyfusards," as the shortest way to put an end to the trouble. We got wind of this; whereupon Clemenceau asked me to sleep at his house in order to aid him to defend individual liberty, gun in hand. Today Clemenceau follows the example set by our former opponent; he holds me in prison, and along with me several of the leaders of the labor party. The latter, by the way, before their incarceration, sent a delegation to the Minister and pointed out to him the contradiction between his present policy and his former course. Whereupon M. Clemenceau answered them coolly: "But how can it be otherwise? We are no longer on the same side of the barricade!" The reply is as amusing as it is true.

In his "Philosophical Dramas," Ernest Renan offers a sequel to Shakespeare's "Tempest." He imagines Caliban placed, thru a revolution, on the throne of Prospero, and, lying in the ducal bed, making these reflections:

"No, I never imagined it was so nice to reign. Especially, I did not know one matured so rapidly by reigning. In the transit from the market-place to this palace, I have changed more than during the whole rest of my life. Now that I am in Prospero's bed, I judge him as equals judge one another. There was some good in him, and, in many things, I am disposed to imitate him. What is more odious, for example, than this inopportune impatience of the populace, this series of impossible petitions which they are showering upon me? What a desire they have for a good time! What subversive pretensions! But my mind is made up. A government should resist such demands as these, and that is just what I mean to do, for people of quality and myself have common interests to defend. I am now in a position similar to these people of quality, and I am in favor of continuing the present condition of things."

I am not Duke Prospero, but I find that M. Clemenceau acts very much like Caliban; and in the jails of the Republic I meditate this extract from Renan in the hopes of curing myself of some chimerical hopes.

SANTE PRISON, PARIS, JUNE, 1906.

High Sovereignty

BY CHARLOTTE PERKINS GILMAN

I LOVE to see my little dog
  Hop round me on the floor,
Unnaturally vertical,
  As dogs were not before.

It is no earthly use to him—
  No earthly use to me;
But I delight in it because
  It proves my sovereignty!

I love to see him hold a lump
  Of sugar on his paw,
And never dare to eat it up
  Till I lay down the law.

I watch his slow, disjointed meals
  With pleasure most refined;
It shows how powerful I am,
  To make the creature mind.

NEW YORK CITY.

The Experiences of a Chorus Girl

[The following story is not a very inspiring one, but it faithfully depicts the life of the average girl on the stage, and as a human document has its place in our series of "Lifelets." It is of some pertinence now when the press of the whole country is publishing columns about a sensational theater tragedy.—EDITOR.]

I WAS born in the city of Philadelphia, of French and Italian parents. As early as I can remember I was crazy for the stage, anxious to mount a platform and display my airs and graces. I danced, danced, danced, all the time. Nobody taught me. I never had a dancing lesson in my life. And my parents were positively scandalized. I made up dances, and practiced every spare minute I could get. My parents were religious people in good circumstances, and I was as much a puzzle to them as a duck is to an old hen who has hatched it out among her brood of chicks.

There was a big mirror in my room, and I would pose for hours before that mirror, studying grace, admiring myself, and thinking what a tremendous sensation I would create if I could only prance before the footlights in some great New York theater.

Mother did everything to discourage me, and at last she said:

"Jeanne, just as sure as you're born, one of these times, when you are making such a wicked display of your vanity, the devil will grab you and fly away."

That frightened me so much that I was afraid to pose before the glass any more. Nevertheless, it did not at all daunt my ardor for the stage, and I danced, danced, danced, in season and out of season. But for safety's sake I always covered the glass with my clothes, so that if Old Scratch did come I would not see him.

While still a child I had the opportunity of appearing upon the amateur stage at various church functions; and the applause that I received was generous enough to satisfy even me. People went wild over me, and told me that I was a beautiful child, "such a clever child" and "a genius"; all of which I firmly believed. I had black hair and big brown eyes, and I was a pretty child when in a good temper.

Of course, I was spoiled, but not by mother. I spoiled myself, and perhaps was born spoiled —I was so full of vanity. And I was a little spitfire, too. When mother used to scold me, I was very insolent. I would not answer back, but I would rest my left elbow on my knee or on a table, and my chin in my hand, and sing as long as the scolding endured. Mother broke me of this one time. She gave me a scolding on account of some outrage that I had committed, and I assumed the indifferent attitude that I have described, and with my chin in my hand sang "Daisy Bell" all through the scolding.

"Daisy Bell" had just come out at that time, and was very popular. Mother kept scolding, but I sang along with much placidity, laying a special stress on the chorus:

"Daisy, Daisy, give me your answer, do!
I'm most crazy, all for the love of you!
It won't be a stylish marriage, I can't afford a carriage,
But you'll look sweet, upon the seat
Of a bicycle built for two."

Finally mother said: "I like that song very much, my dear." She took me by the ear and led me upstairs to my room and made me sing "Daisy Bell" for two hours steadily, while the tears ran down my face; and I never again interrupted her lectures with my singing performances.

Nevertheless, I danced, danced, danced in all my spare time, and I still had exquisite visions concerning the manner in which the whole world would fall down and worship me if my cruel parents would only give me a fair chance to get out and exhibit my charms.

When mother scolded me I used to threaten that I would run away and go upon the stage. I did that so often that at last she grew tired and answered me very sweetly:

"Very well, dear, if you are so determined to run away, I might as well help you. Come along, and we will pack your valise."

So she packed a little grip for me and

put me out on the veranda, saying, "Now run away."

I was terribly frightened, for I was only eleven and a half years old; but after a time I got on a street car and rode to my aunt's house, and there I cried and cried until my aunt sent to mother and she was induced to forgive me and take me home again. After that I never told mother that I would run away from home, and I suppose that if mother had lived I never would have run away at all. But mother died when I was about thirteen years of age, and I and four other younger children of our family were left for my father to struggle with.

He sent me to St. Joseph's Convent and I stayed there about a year, at the end of which time the authorities conferred upon me the degree of G. B.. in consideration of certain exercises which I performed with one of the teachers. This teacher had me standing up before the class for two hours, and something she said concerning me added the final touch that exploded my temper; whereupon I threw an inkwell at her, whereupon the authorities eliminated me.

Of course, when I went home father was far from satisfied with the degree which I had received from the convent, and of course, also, I was even further from satisfaction with his dissatisfaction. Every time he scolded I threatened to run away, and at last I actually did run away. My aunt was keeping our house at the time, but I took my eldest brother into my confidence, and he assisted me in getting my steamer trunk out of the house with a lot of my things packed in it. My brother was the eldest of the other children, and only a little younger than I. I told him about my scheme, and he believed in me and was sympathetic and willing to help in any way that I asked him to.

So we got clear of the house, and I made a race for New York. I was fourteen and a half years of age when I got to New York, and I did not know whether or not I knew a single soul in the entire city. About a year before I had met two New York girls, actresses attached to a theatrical company that had played in Philadelphia. They gave me their addresses at the time of our meeting, but for all I knew they might have been in Hong Kong at the time when I ran away from home. Nor did I have their addresses so particularly noted that I could go right to their house; but I knew that they had told me that they lived in a certain part of Thirty-sixth street, and accordingly I went to Thirty-sixth street and rang the bell of every house in the street for two blocks along, until at length I lighted upon my acquaintances. When they saw me they nearly fell dead.

"Why, child," said they, "what in the world are you doing here?"

Then I told them the entire story, about the heartless manner in which I had been treated, and the dreadful tyrants who prevented me from conquering the world. They were very sympathetic and promised to give me all possible help. And the next day they took me around to the offices of various theatrical managers, to whom they recommended me as a wonder, with the result that I actually did get an engagement with a "Faust" company, my part being a little dance in the first act, for which I received $18 a week.

Our company went to Boston, and there my real stage experiences began. I will never forget the first night when I had to go on. I was ashamed to tell the other girls in the dressing room that I did not know how to make myself up, so while they were making up I stood around and watched them. Presently, when they had all gone on the stage, I dipped my finger in the rouge and smudged it on my lips, giving myself a mouth that made me look like a "coon." But I had no doubt that I was charming, and so was marching boldly on the stage when the manager caught sight of me and nearly had a fit. He sent me back to my room in a hurry and appointed another girl to make me up in a proper manner.

Then and always I found the other girls good-hearted. They were always good to me. They knew that I was a greenhorn, but, instead of laughing at me and playing tricks, they helped me out.

The public of Boston did not exactly go into ecstasies over my performances. I received applause, but nothing so very notable, and it was evident, from the placid interest with which audiences re-

garded me, that they imagined they had seen others who were almost, if not quite, as clever.

This to me was something of a disillusion and disappointment, and other experiences that I had in that company were also disappointing.

It had never occurred to my high and mighty personality that life on the stage might, to a greater or less extent, limit one's freedom. But now I found that instead of the management consenting that I should come and go at my own sweet will and pleasure, they demanded that I should be present, ready to go on, at certain places at certain hours; and when I failed to obey their rules they fined me heavily. So that very soon I was in quite deep trouble. I never had had any experience before in taking care of money, and I soon discovered that so far as this particular art went I was not at all an apt scholar. My salary was $18 a week, and I spent about three times as much, and at last found myself stone broke in Boston, with most unsympathetic creditors unanimously demanding payment.

So I wrote home and told my eldest sister just what my circumstances were, and asked her to give me a lift; and she sent me money from time to time, and then I got a place with a New York theater, where they wanted a good dancer. The theater stipulated that the person whom they engaged must be a graduate of a first-class dancing school, and I had to do a little fibbing. Nevertheless, I did secure the place and kept it for a year and a half; and no one ever questioned my ability to fill it properly.

While dancing one night I gave my left ankle such a wrench that I sprained it, and the injury proved so serious that I was laid up in bed for six weeks. This was a miserable time for me, because my salary stopped, while my expenses increased. I had not a cent saved, and my sister in Philadelphia could not supply me with sufficient money to keep up my old way of living.

Luckily I had some friends. One of them was named "Queenie"; her other name does not matter — probably the whole name was assumed. She was a very beautiful girl, Polish, and a great talker, tall, supple, dark, with a gypsy face. She traveled a good deal and had lived all sorts of a life—or said she had—and she was carelessly generous and always doing impulsive things.

So she took me to her room on Seventh avenue, away up under the roof, and there she trained me to join her in the grand opera chorus. I learned the choral parts of ten operas lying in bed, and as I have a fair light soprano voice, "Queenie" said that I would do very well and a slight limp would not matter.

The chorus at the Metropolitan Opera House does not have to dance, and there are no difficult evolutions to be performed —no Amazon marches or anything of that sort. The things considered in selecting the chorus girls are voices and repertoires. Each voice must be like an instrument in the orchestra, so that all can be woven into harmony.

As soon as I could I went to the Opera House and secured a place there, "Queenie" introducing me to the chorus leader, who tried my voice and examined me in regard to repertoire. I proved satisfactory.

The chorus rooms for girls are on the Fortieth street side of the Metropolitan Opera House, and are up one flight of stairs, and in comparison with accommodations elsewhere they are convenient and comfortable.

But the management is strict. Girls must get to a performance half an hour in advance of its beginning, and there are fines for lateness and fines for absence. Every girl as she enters must register her arrival by pressing a button on which is her number. Some get around this regulation by having a relative or friend press the button, but if they are caught it means discharge.

The first time I sang in the chorus I was a simple village maid in the back row and therefore inconspicuous. "Queenie" stood beside me and introduced the people in the boxes, in spite of the orders against whispering. The best-known women in the country were there, loaded with jewels, and "Queenie" said: "If I had my rights I would be there, too, outshining them all."

Most of the girls in the chorus were Poles and Italians, who had had experience in their own countries, and we got to know a few of them. There were only about six American girls. Very few are

taught in this country. They lack the opera traditions, and that makes it more difficult for them. At the same time there are plenty of good girls' voices in America, while male voices are poorer in quality, taking the average.

At the end of the first season I had a repertoire of eighteen operas, and altho I was able to dance again I kept on for another season, because, to the money received was smaller, my expenses were not so great as when traveling, and the work was not so exacting. I received $15 a week, and it cost me $8 a week to live; $5 for my share of our room and $3 for food and washing.

By the end of the season I had nothing saved, and if I had not secured a summer engagement at Manhattan Beach it might have gone hard with me.

"Queenie" went with me, and there as usual she fell in love with one who she confided to me was the "noblest being on whom the sun ever shone." He was a good-looking little American Hebrew, almost as nervous as "Queenie" herself. I had to give up my share of "Queenie's" room when she was married, but she insisted that I take the adjoining room, which I did, sharing it with a Western girl named Campbell, who had joined the chorus.

"Queenie" and her husband were certainly lively neighbors, for when she felt that her nerves demanded it she would fill herself up with paper and clay and slate pencils and things from the drug store and then have a desperate fit of remorse for her past, confessing to her husband some of her marriages, elopements and crimes. He would howl, bury his face in the lounge and tear out his long, curly, carefully oiled hair by handfuls. Then she would kneel by his side and wildly call upon him to forgive her.

"Maurice! Maurice!" she would cry, "speak to me! Ah, my God, he is dead! No, no, it cannot be. His heart is beating. Speak to me! In mercy speak! See, I kneel to you. Oh, forgive me! Guilty as I am my love is all yours. I could not bear to deceive you. I felt that I must tell you all. Oh, forgive me!"

Maurice would kick and squeal upon the lounge in dreadful agony for a long time, and would then gradually become calm and raising his head inquire:

"Have you told all, all?"

And Queenie would respond: "All, all, Maurice. You know the worst. How could I deceive you."

"Then I forgive you," Maurice would say, and the curtain would fall with the sun shining and the birds singing.

But two or three nights later "Queenie" would confess a lot more marriages and crimes, and poor Maurice's agony would begin all over again.

Once Miss Campbell blew red pepper thru the keyhole while "Queenie" and her husband were in the middle of one of their scenes and totally spoiled all the pathos. "Queenie" raged about the house with a revolver and a sword, looking for the miscreant.

She and Maurice only lived together for about six months, but he had more experiences in that time than he would have had in sixty years with another wife.

Generally we had little to do with the other girls of the chorus, but once we accepted an invitation from an Italian girl to go to a party at her house. It was a birthday party, and took place in an Italian tenement, up five flights of stairs. Eight Italian chorus girls lived in a room that was about twelve feet square, and seemed to think it ample. Every other room in the old building was quite as crowded, and when the party was over I understood how it was that the foreign-born chorus girls were able to send money to their people in the old countries.

After two seasons with the opera I went to musical comedy, singing and dancing and having little parts. But next season I will bid musical comedy good-by and devote myself to the drama. I have a good offer of engagement for next season.

Taken on the whole, I have had a very good time in the chorus. I have been on the stage to my heart's content. I have been in every large city in the Union, playing. I have been received in good society, especially in Boston, and have made many valuable friends.

Nevertheless, the life is a hard one, and if ever I have a daughter I won't allow her to go within a thousand miles of the stage if I can help it. The life is so hard that, healthy as I was when I be-

gan six years ago, my constitution is now much weakened. I have had diphtheria and scarlet fever, and that may account for some of my trouble; but at any rate I am in a highly nervous state, and have had to rest for two weeks lately, for fear of complete breakdown.

Few people think what a hard time the chorus girls have in pursuit of their profession. At country hotels the clerks have fits if we ask for single rooms. They say: "We can't give a room to one person. Can't you double up?" And they try to crowd four of us into a room. Some of the country theaters are like barns. On account of our light clothing we are exposed to great danger from draughts. Then there is no such thing as proper accommodation for the players outside of the great cities, and of course the chorus gets the worst of whatever is going. Not that the stars are mean to the girls—far from it. So far as my experience goes, they are uniformly kind and considerate, and the impression that they are snubby has no good foundation.

But of course it is only in accordance with common sense that the people with the most important parts should have the best accommodations, and so, when we go to such a place as the old theater in Annapolis, Md., the chorus girls are jammed twelve in a room to dress, with not a chair to sit on, not a mirror in the place, no nails or pegs for our street clothing, and the water coming thru roof and walls.

I suppose that $18 a week looks good to many working girls, but after all it does not amount to as much relatively as the $8 a week that the salesgirl gets; because, for one thing, it is not steady, year in and year out, and, for another thing, the chorus girl's life is naturally an expensive one.

She lives in a show, and she must make a show herself if she is to keep up with the procession. The girl who does not dress expensively might just as well give up the business. If she is not finely gowned she may haunt the managers' offices day after day in vain, for she will get no engagement; but if she has a fine dress, everybody in the place is immediately deferential, and she is treated to the best the manager can produce.

The street dress has no possible connection with the girl's appearance on the stage, as she wears what is provided by the management; yet a girl can get a good situation thru the grace of a fine dress, tho she may not be able to sing, dance or do anything else well, while a girl with real talent and a poor dress will be turned away. Of course, a beauty is snapped up immediately, even if she is stupid and can do nothing more than stand still. Plain girls, on the other hand, are all turned down, no matter what they can do.

So, whether we like it or not, we must dress expensively. Then, again, our board is expensive. We are traveling about so much that we cannot settle down and find a boarding house to suit us. And so we have to stop at hotels, and of course they all fleece us. Then the whole atmosphere about us suggests spending money freely. Money comes in so easily that it naturally flows out with equal ease. We are thrown into the company of people who are spending a good deal, and we ourselves like to be good fellows. As I have said, when I first began in the business I earned $18 a week, and spent three times as much, which, as any financier knows, is simply ruination. I am now making a great deal more than $18 a week, and, tho I manufacture all my own dresses and hats, and am looked upon by my friends as a marvel of economy, I find it extremely hard work to keep out of debt.

Then, again, we don't get a cent except when we are actually playing. We receive no pay for rehearsals, and the rehearsals sometimes take up as long a period as ten weeks, during all of which time the ladies of the chorus must eat, sleep and wear clothes.

So it isn't always blue sky and sunshine in the country of Miss Tottie Footlights, however Miss Tottie may smile at those who come to see her in her professional capacity. To tell the honest truth, Miss Tottie is a very much misunderstood young lady. In proportion there are just as many good girls in the chorus business as are to be found in any other profession. Some chorus girls are very religious. One with whom I roomed for a considerable time used regularly to get up at five o'clock in the morning to go to mass, and she was by no means a great

exception. I think that a large part of the "wicked chorus girl" tradition is to be credited to low class illustrated newspapers, which select chorus girls as heroines of mythical adventures, because those girls are to a certain extent public characters, and because the clothing which they wear on the stage lends itself to the peculiar pictures which such papers find attract their patrons.

A little while ago I was invited to a supper in Boston. I have said that I am frequently invited out into society, and that is one of the pleasant privileges of stage life. I was the only actress present at this party of which I speak, and I was very considerably surprised when, after supper was over, cigarets were passed around and the ladies all smoked. They were greatly astonished to discover that I did not smoke, and still more astonished when I told them that I had never smoked a cigaret in all my life, and knew very few chorus girls who did smoke. Some people imagine that where the stage and society meet, society runs quite a little danger of being corrupted, but my own experience seems to indicate that the boot is quite likely to be on the other foot.

I have spoken about the hard times which the chorus girls frequently experience, her exposure to evil sanitary conditions, and the long period when she is earning no salary at all. Also the spendthrift atmosphere and compulsory wearing of expensive clothing. All of which help to make the life hard and profitless. But there is another sort of thing that provides a very strong reason why I will never let my daughter go upon the stage, provided I ever have a daughter. The girls are often exposed to great temptation. In some instances rich men who have much to lose will set their hearts upon capturing a certain girl, and will pursue her with the utmost boldness and persistence. It can hardly be possible but that sometimes this sort of thing produces tragedy; yet concerning these chorus girl tragedies, which I suppose do happen, I know nothing at all. On the other hand, I have seen some comedies. A girl who had been steadily pursued by a wealthy young man at last agreed to meet him at Rector's, each bringing a friend.

On the evening in question the girls met the men, and found a most elaborate banquet provided and a band of musicians. The young gentleman who was striving to uplift the stage had not spared expense. Immediately after greetings the girls said that they must withdraw for a moment to telephone.

They went and never returned, and I don't know what the young men did.

One evening a few weeks ago I observed a young man in the front row orchestra seats staring at me in a most lugubrious manner. After that he appeared each night and stared with more and more mournful reproach, and at last I got a letter from him. He wrote that I was his ideal, and that he wanted me to love him, and, of course, asked for an interview. He said that he was seventeen years of age and wealthy. I was tempted to ask him to consult his mother. And he was only a little more absurd than the usual "Johnnie."

I have not said anything about the chorus girl's troubles with her stage clothes. The green girl has an awful time at first playing Amazon or sailor or wearing tights; she is as clumsy in boy's clothes as a boy would be in her clothes, and as uncomfortable. The drills, too, are no play. Plenty of girls whose parents are comparatively well off come on the stage, attracted by the glitter of the life, but they soon depart again, glad to get back to their homes. Many a time I've been sorry that I ran away from home, but my father never forgave me and probably never will.

New York City.

Government Insurance in New Zealand

BY FLORENCE FINCH KELLY

[Mrs. Kelly has just returned from New Zealand and Australia, where she went expressly to study the workings of the radical legislation of these countries. She is a graduate of the University of Kansas, and the author of several novels and of numerous articles on sociological topics. The article is especially timely just now when the country is considering the subject of insurance.—EDITOR.]

ONE of the deepest of the many pleasant impressions which New Zealand makes upon the visitor is that in its public affairs it is a land of peace and probity. The incessant clamor of investigation into the conduct of public and semi-public business, the dust and stench of constant disclosures, which have come to be almost the normal condition of life in the United States, are practically unknown in that island colony of the southern seas. Such a national disgrace as the insurance scandals, which have so shocked and amazed the American public, would be impossible there. The methods of the Government insurance department and the honesty and publicity with which the office is administered give absolute confidence to the New Zealander insured therein. In thirty-six years there has not been even a suspicion of wrongdoing in the department.

Government life insurance has had a thoro test in the colony, but fire insurance is one of its recent experiments. The life insurance department began work in 1870, having been established because of the failure of two British companies in which many New Zealanders held policies. It was the result of a general public conviction that there must be greater security in life insurance and that their own government was the likeliest place in which to find it. The act establishing the department was passed by unanimous vote of Parliament.

The Government insurance office does business in competition with all the other companies that wish to enter its field, and it has not only beaten them in the contest but is steadily gaining on their business. It does 41 per cent. of the entire life insurance business of the colony, and now transacts the largest amount of new business. Ten foreign companies compete with it. Six of these are Australian, two British, and two are American, the New York Life and the New York Equitable. The two latter have been in the colony nearly twenty years, and hold together only 3,000 policies, assuring $5,500,000. The big Australian Mutual Provident Association is the only foreign company that transacts anything near the amount of the Government business. It has been in New Zealand more than forty years and holds 30,700 policies, assuring $40,000,000. The Government office has in force over 44,000 policies, assuring $55,000,000.

The utmost publicity is afforded by the reports issued annually and triennially, which give full details of the work and progress of the office. An English insurance expert has declared that in form and contents its annual report is well deserving of imitation by all offices that court public inspection.

But the unique distinction of this insurance office is that behind every policy stands the Government of New Zealand, guaranteeing its payment. No fears need ever disturb the mind of the policy-holder concerning his security.

The department is co-operative and is conducted on practically the same methods used by private mutual life insurance companies. It is entirely self-supporting, even to its telegrams and postage, and the expenses and taxes are borne by the policy-holders, who share the whole of the profits. Its officials work for modest salaries, comparable to what they would be able to command elsewhere, and these they endeavor to earn by honest, efficient work and devotion to their duties. The department does not consider the creation of a big surplus to be sound business management, and, as it does not have to pay large sums to legislative agents, contribute to campaign funds, or create kind-

ly feeling by means of expensive social functions, the policy-holders find there is something to share when the profits are divided. These now accrue at the rate of nearly $350,000 per annum. The department has distributed in dividends to policy-holders $5,000,000 in cash.

Bonuses are allotted every three years, but by a recent arrangement interim bonuses are given in the case of claims by death or maturity, and are included in all calculations of surrender values, whether the policies are actually surrendered or are borrowed upon or the premiums are overdue. It is the policy of the office to make things as easy as possible for those who get into temporary financial straits, and in accordance with this purpose the policy-holder who is compelled to surrender receives the proper proportion of accrued bonuses for every premium paid since the last valuation. It is the same kindly, human, brotherly spirit which marks the administration of every department of the New Zealand Government.

This kindly unwillingness to take advantage of another's necessities is shown also in the system by which a policy on which premiums are overdue continues in force automatically. The 27,000 policy-holders in the Equitable who have allowed their policies to lapse during the insurance disclosures and convulsions would no doubt be thankful were such a scheme in force here. Surrender values and loan values are allowed after two years, and if after that time the premium is not paid an account is opened crediting the policy-holder with the surrender value and increases therein, and debiting him with premiums and interest thereon as they fall due. As long as the amount to credit exceeds the amount owing, the policy is in full force, and in the event of death or maturity the sum assured and bonuses less the arrears with interest are paid. During one recent year twenty-nine overdue policies fell in by the deaths of the persons assured, and, altho on most of them not a penny of premium had been paid for six years or more, the department recognized claims upon them to the amount of $40,000, exclusive of bonuses. Lapsed policies which have not acquired a surrender value, or in which the surrender value has become exhausted, may be revived within twelve months by giving proof of health and paying arrears and a fine.

The policy of a holder committing suicide within six months of the date of the policy does or does not become void, according to the discretion of the commissioner. If he is satisfied after making careful inquiry that there was no suicidal intention at the time of the taking out of the policy he pays the claim. The extent to which the officials of the New Zealand Government are allowed to exercise their common sense and their human feeling in their dealings with the people is a bit surprising. In every department one meets with that same kindliness and fair play instead of a strict adherence to the letter of the law. It has the effect of making the Government in its relation to the people seem more like a band of elder brothers than a complicated machine.

Endowment assurance is the class of policy chiefly issued. This fact makes comparison of New Zealand rates with those in this country somewhat difficult, but they are lower than those charged by the private companies doing business in the colony. The Australian Provident Association pays larger bonuses, but charges higher premiums. But it is a much older institution and has branches in many parts of the world, while the department does little business outside the colony. The death rate in New Zealand is the lowest of any country in the world, and this fact, of course, helps to make possible both lower rates and larger profits. The premiums originally adopted by the insurance department were very low, and were not framed to provide bonuses. But even these low rates produced surpluses from the beginning, and when it was found necessary to provide bonuses in order to compete with the private companies the rates were raised. The premium now charged on an endowment policy for $500 taken out at the age of thirty years and payable at death or the age of eighty is $11 yearly; in thirty years, $15; in twenty years, $22. Extra premiums are not charged for women, nor for any occupation other than that of engaging in the manufacture or sale of intoxicating liquors. Under-average lives are accepted at increased rates, or the proposer, instead of paying an increased premium, may agree that a de-

duction shall be made from the sum assured in the event of death within a certain period.

The liquor question is always alive and extremely vigorous in New Zealand, and therefore it was found advisable to start a temperance branch, which contains only policies on the lives of total abstainers. The accounts of this branch are so kept that if there are any profits arising from superior vitality they may be enjoyed exclusively by those who have earned them. The bonuses in the two sections do not differ materially, sometimes one and sometimes the other being a trifle the larger.

The investments of the insurance department are controlled by a board consisting of the Colonial Treasurer, the Surveyor General, the Commissioner of Taxes and the Insurance Commissioner. The investments are mainly confined to New Zealand Government securities and to loans to local bodies and policy-holders and on real estate. Its assets are $18,800,000. Its income for 1904, from new premiums, renewals and interest, amounted to nearly $2,500,000 and its expenses were 20 per cent. of the premium income. Since its inception it has paid $13,500,000 in claims. During the last fifteen years there has been an increase of 62 per cent. in the number of policies in force, of 40 per cent. in the sum assured, of 265 per cent. in the bonuses, of 768 per cent. in the annuities, of 61 per cent. in the income, of 132 per cent. in the accumulated funds, and a decrease of 6 per cent. in the expenses of management and of 33 per cent. in the ratio of total expenses to total income.

An accident insurance branch was opened in 1901, mainly for the purpose of covering the liabilities of employers of labor, which had been much increased by the workers' compensation for accidents act passed the previous year. Personal accident policies are also issued. The costs of conducting the business are carried entirely by the accident branch and the life funds are in no case liable.

A combined insurance and annuity scheme has been in operation since 1893. In return for monthly deductions amounting to about $25 annually for every $500 of salary the insurance department contracts to give a uniform initial insurance of $500, increasing with the salary, until the age of sixty is reached, and after that an annuity varying with the age at entry. These policies are placed in a separate table, but are merged in the general business, and share in the distribution of profits. The scheme is compulsory upon all civil servants who do not insure of their own wish. But more than 90 per cent. of the Government employees have taken out their insurance of their own initiative. They may insure in whatever company they choose.

A little more than a year ago a fire insurance department was established, in compliance with a strong popular demand. The fire insurance companies had kept rates at an exorbitant figure, and, as the life insurance department had proved so successful, the people all over the colony demanded that the Government should go into the business and establish fair rates and a more liberal policy.

The department opened its doors with a flat reduction of 10 per cent. in all classes of business. The private companies met this, and then cut under still farther by a reduction of 33 1-3 per cent. on dwellings—the "W" of insurance classification — and the Government promptly made its rates the same. There the rate question has rested ever since, while the companies have been trying a flank movement. If the owner of an insured property takes out a Government policy the underwriters cancel his insurance. If the Government cannot take a risk the owner finds that the private companies at once raise the rates. The companies refuse to recognize the department or reinsure its risks. But it has been able to make reinsurance arrangements with Lloyds' in London, and is not disturbed by the attempted boycott. It is careful not to jeopardize the interests of its clients in its fight with the private companies, and if it cannot take the whole of a big risk it cancels its own business rather than subject the owner of the property to the boycott of the combine.

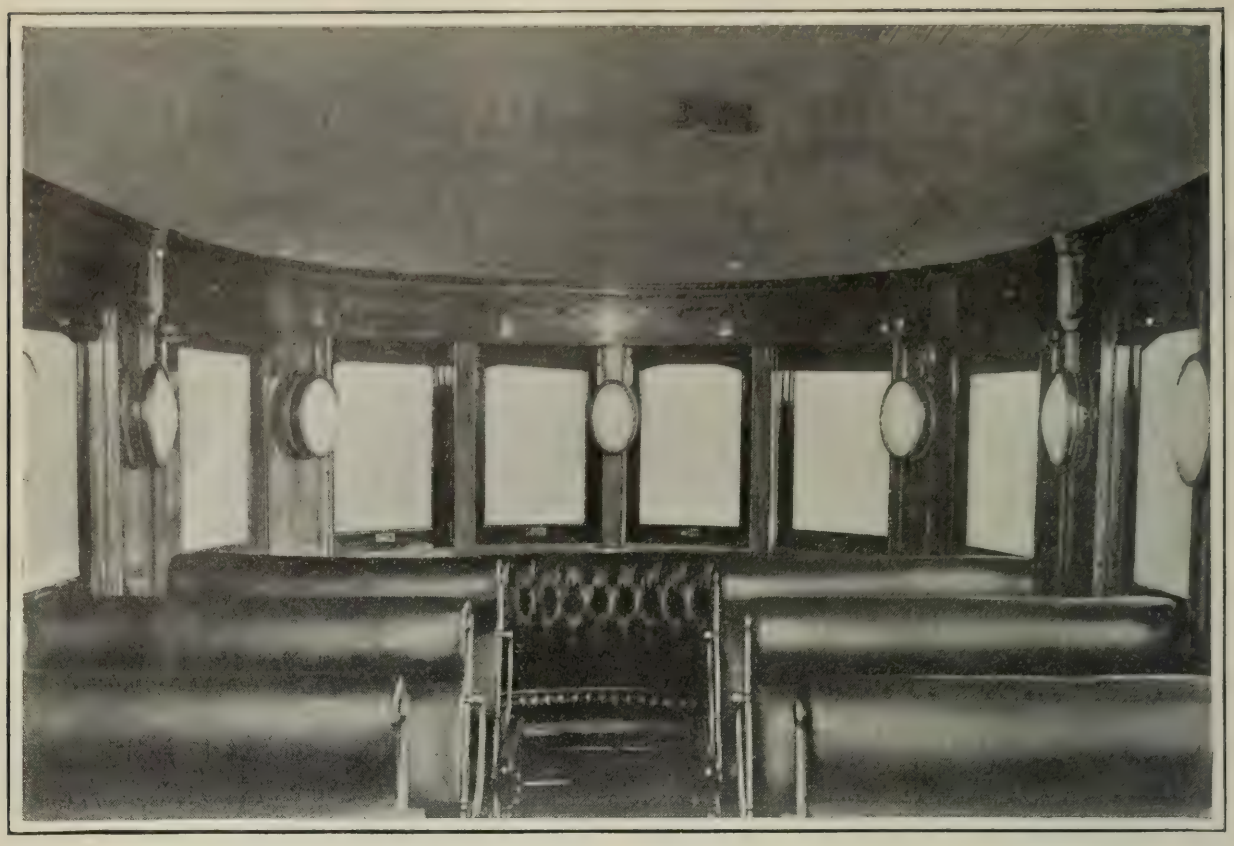
The fire insurance department has saved to the people in the first year of its operation more than half a million dollars in premiums. The commissioner is well satisfied with the results of the first year's work. But he is a conservative man, and said that he did not consider it a sufficient test of the merits of the scheme.

New York City.

The Motor Car in Railroading

BY CHARLES MOREAU HARGER

WHILE the East is considering the "electrolization" of the steam railroads, the West is looking in a different direction for its transportation change. The motor car is becoming a factor in the plans for the management of local traffic on the branch lines, and it has a fine field in which to operate. For many reasons it is adapted to the West in a larger degree than to the East, and it is interesting to note its many advantages now that they are being developed by the promoters of this sort of passenger and freight movement.



The new motor car differs from the trolley system in that it contains within itself all the power needed for its movement. In the East, where waterfalls like Niagara are found to furnish unbounded quantities of electricity, it is not difficult to equip an electric line. The current can be furnished at a price that enables the promoters to pay good dividends. Then, too, there is plenty of patronage, because the population is large and the towns are near together. A trip over a trolley line thru central New York takes one from village to village with only a few miles between settlements.

This would be impossible in the West. An Eastern promoter was induced to go to central Kansas to look over the prospects for an interurban line a year ago. His report included this observation: "Why should we spend thousands of dollars to connect a hamlet with thirty people and a village with 150 people, none of whom wish to visit the other place?" That is the difficulty with the trolley system in the West—not to mention the excessive cost of power when it must be produced by coal that costs twice what it does in the Eastern States.

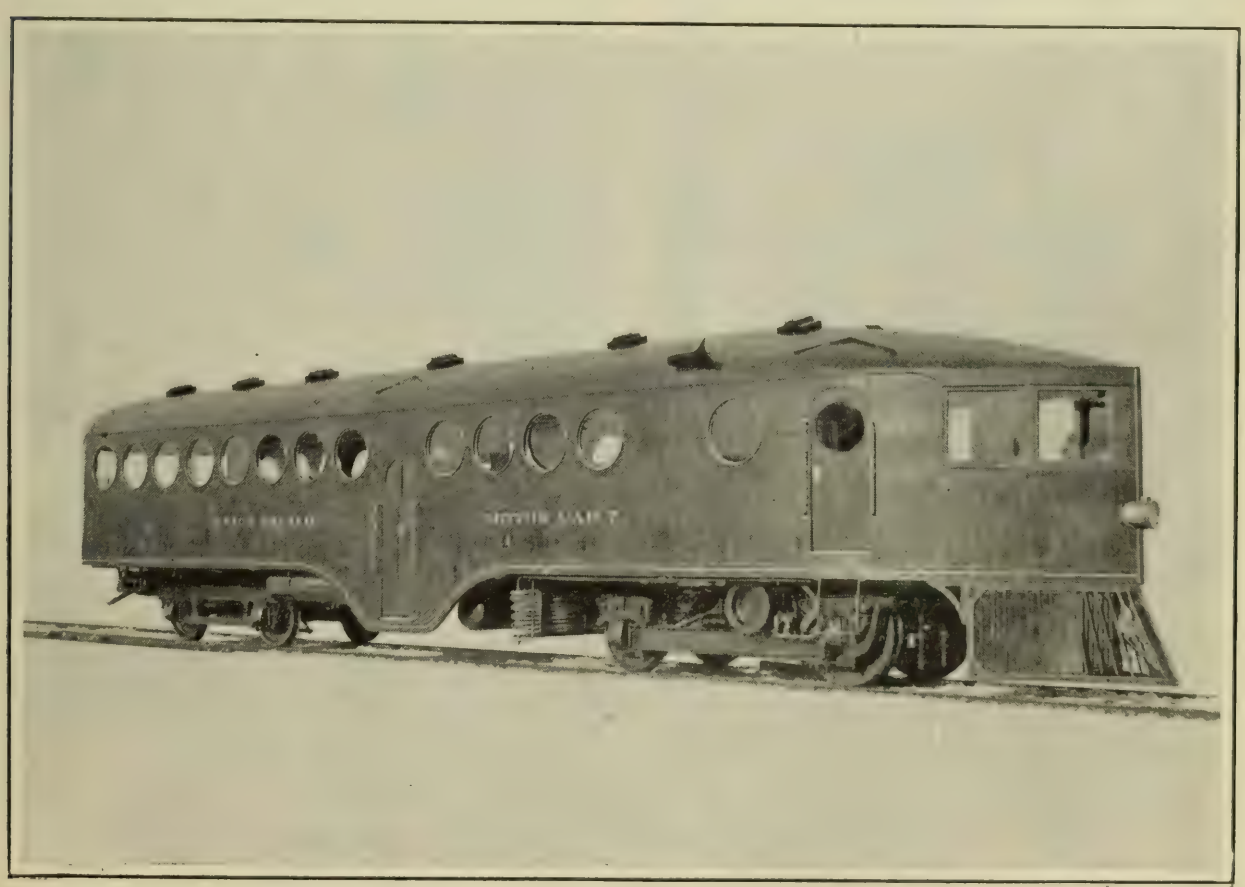
Then there is to be considered the conditions under which the Western steam railroads were built. A glance at a

The First Gasoline Motor Car

Interior of the Modern Motor Car.

railroad map of the West will show that the systems consist generally of one principal line connecting cities of prominence and this fed by a score or more branches leading up the valleys and into the grain sections. These branch lines are operated to connect with the main line, of course, but they are nevertheless expensive to conduct in their passenger department, as there must be a full complement of baggage, mail and express assistance for the trains. At least one strictly passenger train is run over each of these branches every day, tho often a single car would handle easily all the traffic furnished by the tributary country. These branches were usually built by means of bonds voted in the various communities; and because the bonds could be secured more branches were built than the main line needed. In many places parallel branches run for miles near to each other, and are operated at a loss merely as a matter of pride or of custom.

Here it is that the motor car finds its greatest opportunity. To equip such branch lines with electricity would be extremely expensive. The furnishing of power would be at a prohibitive cost. If there can be devised a motor car that will supply its own power and can be operated at a minimum of expense it means a new era for the branch lines. This it is that new inventions have sought to accomplish, and the results of the experiments already made are most encouraging.



Two types of motor cars are considered by the railroad managers. Both depend on gasoline for the primary power, but one utilizes that power directly in propelling the car; the other applies the power to an electric battery, and has the presumed advantage of the storage of electricity in addition to the direct force that the gasoline itself furnishes.

The Union Pacific was a pioneer in the manufacture of the gasoline motor car. Its Motor Car No. 1 was completed March 1, 1905, and its No. 7 was put in service in April of the present year. The first model made a long-distance run from Omaha to Portland, Oregon, and return, entirely under its own power, climbing some of the steepest grades of the Rocky Mountain region without difficulty. Last August it went into regular service on the Kear-

ney-Calloway branch in Nebraska, making one round trip daily. The following month Motor Car No. 2 was put in service. It was a distinct variation from the first model, and is likely to mark a new variety of service cars for railways. It is built on the plan of the yacht, with port holes for windows, tapering steel-covered body, being made to present the least possible obstruction to wind. This plan has been improved and changed until it has become No. 7, the latest design from the shops. All these cars are in actual service. One is used in Kansas between Leavenworth and Lawrence; one between Houston and Galveston, Texas; one on the Oregon Short Line; one in California out of Los Angeles. So successful have been the tests that many more will be used as fast as they can be manufactured.

The weight of the car is about 56,090 pounds, a very light design; its structural arrangement prevents telescoping. Each car is driven by a one-hundred horse power, six-cylinder gasoline engine, designed to meet regular railroad car service requirements; has a "make and break" spark ignition, with a primary battery to start on and a magneto for running service. The six cylinders, 8x10 inches each, upright type, placed at right angles to center line of car, are arranged and connected up in sets of three, resulting in three power-giving pulsations at each revolution of the crank shaft. The acceleration of the cars, owing to their weight, is slower at the beginning, say for fifty feet, than the trolley car, but after that it is very rapid. Speed of better than a mile a minute has been made on several trial runs, and forty miles an hour is a usual performance. Where the requirements of the service demand, trailers consisting of combination mail, baggage and express cars weighing about 18,000 pounds and of the same general form as the passenger cars are used satisfactorily.

The other style of motor car is the electric motor car. This is managed on the theory of being an independent electric car. Its system is a combination of the gasoline engine, a dynamo and a storage battery. The engine furnishes the power to run the dynamo and to generate electricity for the motors that operate the car; the storage battery, on

The Latest Model Gasoline Motor Car

the one hand, receives the surplus power from the generator when the load is light and on the other furnishes the excess power required during acceleration and on steep grades.

It is claimed by its advocates that gasoline operation alone is impracticable because of the difficulty of transmission to wheels of a moving car. It is also believed by the advocates of the electric motor car that a serious objection to the direct operation by a gas engine is the absence of reserve power for temporary overloads, necessitating engines large enough for the highest demands, regardless of the average power required. It is likewise pointed out that the gasoline engine is difficult to control, but is the lightest and most efficient power producer; while the electric operation of cars is complete in its control, but is wasteful in power production and transmission. Therefore, by combining the two systems, using the gasoline engine for primary power and electricity for transmission and control, with storage battery for overloads, it is hoped to secure the ideal independent car.

The first of these cars, known as the Strang Electric Motor Car, is in operation on an interurban line running southwest from Kansas City over the course of the old Santa Fé trail. Previously it was tested by runs to the principal cities of the Eastern and Middle States and was inspected by hundreds of railway men. The engine is of the four-cycle type, of special construction. Kerosene, alcohol or crude oil may be used instead of gasoline with slight change of adjustment of the vaporizer. The arrangement of the car is similar to the usual parlor car, with smoking and passenger compartments. The average gasoline consumption is 45-100ths gallons per car mile. One hundred gallons of gasoline are carried in the tank, which is beneath the car floor, giving a mileage radius of 225 miles.

Whether the gasoline car or the gasoline-electric car shall be the victor in the struggle for supremacy is to be determined by use. Each claims superiority, and the success of either will depend on the test of steady service. This test is thus far too short to give positive results.

Probably the strongest argument against the use of the motor car was voiced by a Chicago railroad man: "What can we do with our old coaches if we cannot use them on the branch lines?" Today the out-of-date coach is sent to the country branch lines, where it does duty on the bob-tailed local or "plug" trains. With the motor car there installed the worn-out coach would go to the scrap heap.

From the point of economy, as well as from that of utility, the motor car seems likely to fill an important place in interurban traffic. It may not for a time go on the branches of the great railway systems, but it will be needed on independent interurban lines, where the trolley is impracticable, and will doubtless grow in favor.

When the farmers add the hourly motor car service past their door to the rural free delivery of mail, the rural telephone—and possibly the electric light transmitted along the same poles that carry the telephone wires—they will be unwilling to trade positions with the dweller in town or even with the occupant of the home on the aristocratic city street.

The Hypocrite

BY MICHAEL EARLS, S. J.

A sky-dropped smile and summer's breath
Lie on the pond in placid rest;
In darkness of the under-breast
Are weeds and reptiles foul with death.

BOSTON COLLEGE.

West Virginia and the Tariff

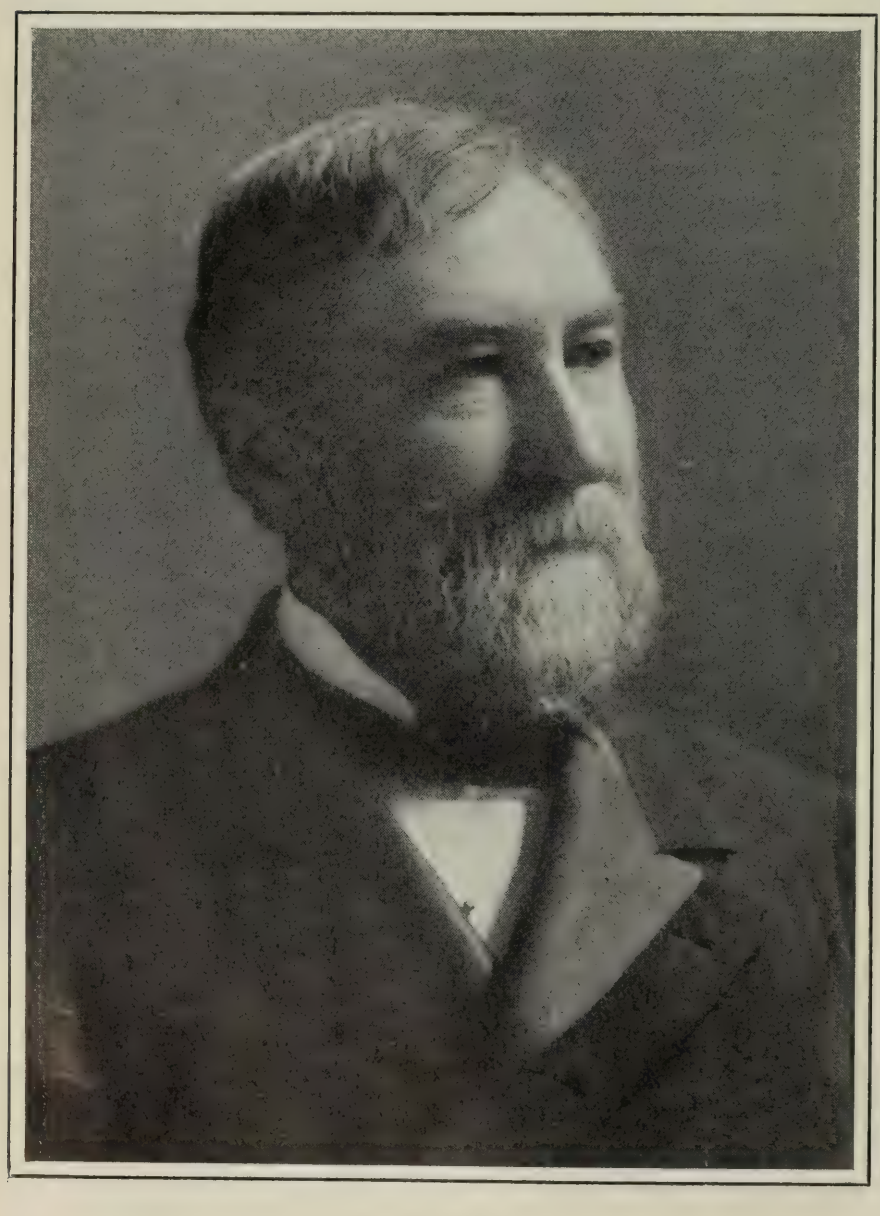
BY NATHAN BAY SCOTT

[The Hon. Nathan B. Scott, United States Senator from West Virginia, is a veteran of the Civil War, who immediately after the war settled in the State, where he has ever since resided, identified with large commercial interests. He was Commissioner of Internal Revenue under President McKinley, and has been in the Senate since 1899, serving upon several important committees. He has an intimate knowledge of the development of the State. The article which he has written is especially interesting at this time, because the Democratic party intends to make tariff revision an issue in the approaching Congressional campaign.—EDITOR.]

HERE and there, nowadays, one hears the claim advanced for the revision of the tariff. It is no new sentiment. Our Democratic friends, always and ever for free trade or the nearest practical approach to it, never lose an opportunity of airing revision. But in West Virginia we are "standpatters" and believe in letting well enough alone. I have often been asked why West Virginia, a Southern State, has taken such a stand and why we are even able to divide our State Democracy on this question. The story is one soon told, and this is it:

West Virginia, as a State, was forty-three years old last month of June. She was set apart from Virginia in 1862, but not admitted to the Union until 1863. For years ignored by the eastern portion of the "Old Dominion," the western part was looked upon as a mountain wilderness. But that wilderness produced a hardy race of sons who, as soon as the Civil War was over, began the development of her great destiny. Until the Centennial year many West Virginians themselves did not know, except in a general way, and the world at large not at all, of the State's wonderful resources, and everywhere the Commonwealth was spoken of as "The Little Mountain State." Now the West Virginian has dropped the "little," and is proud everywhere he goes to boast of his State and to describe its wonderful and vast resources.

In its area of twenty-four thousand seven hundred and eighty square miles there is more natural wealth than is, perhaps, crowded into the same space in any other portion of the world. In coal her supply is almost inexhaustible, and the value is almost incalculable. She; in this one product of nature alone, is one and one-half times larger than the entire area of the coal fields of Great Britain. The value of her coal, it is estimated, is greater than the value of all the gold and silver of the Pacific Coast. Over seventeen thousand square miles of her territory is underlaid with this mineral. But this gives but a very faint idea to the general mind of the immensity of this deposit. To say that there are over ten million acres of West Virginia in coal land gives but a little better idea. When it is stated, however, that the coal of this State could furnish the entire world with its fuel for centuries some idea can be gained.



The presence of coal was known to the earliest settlers, but there was no development made until 1855. In 1863 a few small coal mines produced some coal for domestic consumption, and in 1864 the first splint coal mine was opened. Yet today the State is second in the production of coal and coke, and I predict in a few years she will be first. Railroads have been built; her rivers have been locked and dammed, and her mountains have given up their wealth. From easily mined veins, ranging in thickness from a few inches to almost thirty feet, the "black diamonds" have been taken out and shipped to all parts of the world. The veins have been so easily accessible that the mining industry has been most attractive to capital, and the production, as a consequence, large. In one mountain in the State there are no less than eleven veins, one above the other, from two feet seven inches to twenty feet in thickness, aggregating sixty-eight feet eleven inches of coal. Aggregate thicknesses of from twenty-five to fifty feet of coal over the same property are not infrequent. And this is only one of nature's gifts.

Her wealth in petroleum is unknown, and what the future of this product will

be no one can tell. She almost ties Pennsylvania for first place for the excellency of her product. She ranks second among the States in the total value of the petroleum produced and fourth in quality produced. So far back as 1771 Thomas Jefferson described an oil spring in the beautiful Kanawha Valley, and just before the Civil War the discovery of oil in shallow wells, near the city of Parkersburg, caused the most intense excitement, scarcely equaled by the discovery of gold in California. Towns sprang into existence, derricks were erected, oil wells bored, almost in a day; but the war broke up the oil excitement and it was not until 1865 that the industry was put on a legitimate basis.

The "burning springs" of the State were well known to the Indians and were looked upon by them as indications of the wrath of the "Great Father." George Washington himself describes one of these phenomena; but it was not until the latter part of the last century that practical use was made of this gift of nature. A well was bored in one of the upper counties, and gas was found in sufficient quantity to be used in manufacturing. Since that time wells have been bored in all directions, and the State now ranks as third in the production of natural gas. Last year the value of this product amounted to over eight millions of dollars.

In addition to coal there is other great mineral wealth. Sandstone of almost any size and texture can be quarried. In one county a beautiful sandstone of a light buff and dove color is found; in another a character of sandstone which has few equals, if any superior, for building purposes, in the United States; while in other sections materials for the building of locks and dams by the Government have been discovered. An abundance of good potter's clay and fire clay is found, and West Virginia ranks fourth in its production of pottery products. Good grits for grindstones and valuable iron ore are located in many of its hills, and one county of the State furnishes a white sand of exceptional purity, about the best found in the United States, for glass making.

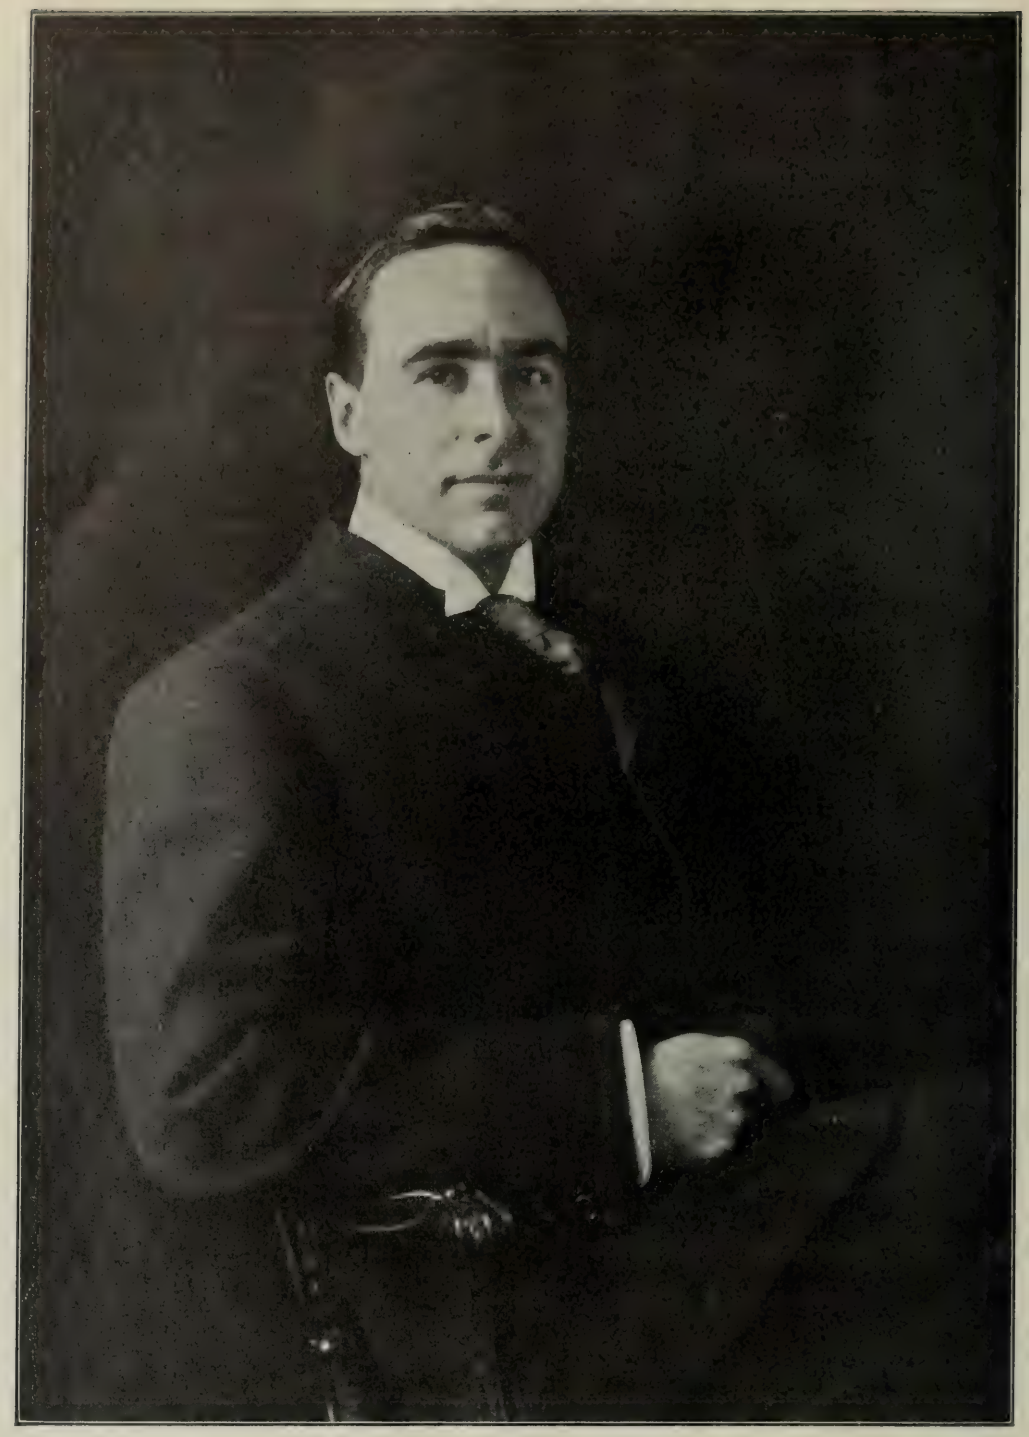
Senator Scott.

Our forests are perhaps the greatest now standing as regards hardwoods. By far the larger portion of the uncleared lands is still in forests, where the axe of man has never found its way. Except in California, where the "redwood" trees attain

tremendous size, no finer timber can be found within the confines of the Union than that which grows in West Virginia. Tremendous onslaughts have been made upon these forests and armies of choppers have made inroads on the woods thruout the State; but yet we still have an abundance of hardwood, and some of the largest tanneries of the country are located within our borders.

Yet with all this great wealth we are proud of our farms, for West Virginia is an agricultural State. The blue grass of Kentucky is equaled by that of Greenbrier and adjoining counties near the center of the State, and the stock raised there brings the highest price of any meat that is brought into the New York markets. Sheep roam on a thousand hills, and their wool is among the best produced.

Three great railroad lines traverse the State and the fourth and fifth are being built. For three hundred miles the Ohio River forms the western boundary and into it empties four great streams, three of which have been locked and dammed by the Government, and contracts will soon be let to make the fourth navigable at all seasons.



Thus blessed by nature West Virginia has possessed from the beginning, and still possesses, the two great elements of success for manufacturing—cheap and abundant raw material and cheap and abundant fuel. As I have shown above, nowhere else in the world are these two essentials of manufacturing life more abundantly found, and I believe, and the great majority of the people of West Virginia believe, and in fact know, that the raw material and cheap fuel would still be lying undeveloped in our mountains and valleys had it not been for the Republican party and a protective tariff. It would have been absolutely impossible, without our protective tariff, to have established in this State the iron and the pottery industries, enabling us to make the finest wares produced anywhere. There would have been no glass manufactures, of which we are so proud; there would have been no development of iron mines, of our oil fields and gas wells, which are pushing our State to the very front rank. There would have been no such development of our agricultural lands or of our lumber interests.

The Census of 1870 was the first to schedule in any way the material interests of West Virginia, and all comparison as to growth must be based on that. In that year our population was four hundred and twenty-four thousand; today it is one million two hundred and fifty thousand. Of these eight hundred thousand are over ten years of age, and among them are only eighty thousand illiterates. In 1870 we had only eleven millions of capital employed in manufacturing; now we have over five thousand manufacturing establishments with upward of eighty millions of capital invested, and finished product worth one hundred and twenty-five millions. In 1870 we had only one thousand five hundred and twenty-seven miners with an annual wage of eight hundred thousand dollars. Now we have seven hundred mines in operation with over thirty thousand wage earners, with an annual wage amounting to eighteen millions. In 1870 the product of our mines was valued only at two and one-half millions, while now it is valued at over fifty millions. In 1870 the value of our farms was only one hundred millions; now it is more than double.

With all this material prosperity the West Virginian has in all these years been most careful in caring for the intellectual advancement of his children. The wonderful growth of the State has given him an opportunity to establish a most magnificent public school system. This has been complemented with a series of normal schools, preparatory schools for the University and the University itself. This latter is an institution of high rank and during the present year has an enrolment of eleven hundred students.

Our villages are growing into beautiful towns and our towns into equally beautiful cities. Magnificent homes are scattered from one end of the State to the other, and the social life is of the kindliest and best. West Virginia wants this progress to continue; and wants her products shipped into every market of the world. This is why West Virginia believes in a protective tariff. West Virginia wants to take no backward step of any kind, and this is why she believes in "standing pat," is against revision and gladly welcomes within her borders capital and all those seeking homes.

WASHINGTON, D. C.

Winston Churchill

Winston Churchill's Novel

MR. CHURCHILL'S latest novel* is his best novel. Some of us thought that "The Crossing" was a trifle far fetched. There is a realm of the imagination located somewhere between the history of what we have been and the poetry of what we might have been which is interesting, but not convincing. We never pass completely under the illusion. Just so we never could quite surrender to the blue and gold trimmed mascot boy who did the drum beating and the miracles in that story of "The Crossing." But anybody can believe this last story, even to the scenery, love making and political sharp-shooting that Jethro Bass did at the State Legislature from his "Thrown" room in the Pelican Hotel.

There is one thing which readers of fiction nowadays often lack the patience to appreciate—good descriptions of natural scenery. This is character drawing of the earth herself, and far more refreshing when well done than the caricaturing so often made of human nature

* CONISTON. *By Winston Churchill.* New York: The Macmillan Co. $1.50.

in the men and women who strut thru the tale. And in order thoroly to enjoy this novel the reader must have a taste for appreciating good drawings of the face of the earth. There are pages dealing with Coniston Mountain and the Clovelly township which remind us of Sir Walter Scott's highland descriptions. And since, like music, natural scenery derives its chief charm from association, the author has measured his mountain to the heavens with thoughts that have wings for eternity. Note this vision of the old politician who had fought and then for love's sake deliberately lost his victory, consoled at once as he passed down to defeat, thinking of another scene—of a granite-ribbed pasture on Coniston Mountain that swings in limitless space from either end of which a man may step off into eternity. William Wetherell, in one of his letters, had described that place as the "Threshold of Nameless Worlds, and so it had seemed to Jethro in his years of desolation." Here are two sentences which include man and nature and God in limitless speculation.

But now for the story; it is a love story which lasts into the hearts of the second generation, as full of sweetness and purity as if it were not the fashion now to damage love with evil reports. There are two heroines, lovely Cynthias, more alike than two women ever were before in the same story, and each reminding us of "Nancy Stair" in dearness. There are also two heroes, the old one and the young one. The former never really leaves the stage, and he is the character in the book upon which the author has spent most of his wit. Jethro Bass stuttered and kept his mind fixed upon the thing he wanted—kept it upon the woman he loved long after she had passed out of his life. And few have drawn a scene of braver contrasts in the power and beauty of love between a strong, primitive man and a gentle woman than the author has set down in in the chapter where Cynthia comes into the old tannery to chasten Jethro for his political unscrupulousness. But Jethro was not to be outnumbered. He laid love away like a scripture in his heart, and took to politics as a man takes to battle. He began by getting mortgages upon all the property in his district; after that he had the votes as a plain matter of business. He became a "political boss," skilled in all the iniquities of his profession, despised and prayed to by henchmen, Governors, Senators and railroad magnates. A more infamous character can scarcely be imagined, yet Jethro was a hero over and above his infamies, a man silently capable of the supreme surrender at the moment of greatest sacrifice to himself and of greatest gain to the one he loves. He had a river of life in him which love had kept pure and undefiled.

Now in the light of our times it may be thought moral trickery in fiction to portray such a character, to show that a briber and bribe-taker could demonstrate some of the noblest virtues. There is a certain set of young economists among us who will not commend Mr. Churchhill's book. But then he may not have had them in mind when he wrote it. Besides, it is a fact, which even the walking-delegate novelists dramatize with emphasis, that a bad man is often a good man. It would almost seem that about the only kind of badness a socialist will not permit his good man to indulge in is political badness. But we must remember that during the first Boss Era in American politics, when Jethro reigned and "carried the State in his pocket," it was not so reprehensible as it is now. Now the Socialists are inventing other forms of heroic badness, such as thugging the rich; and so it goes, because inevitably we must all come short of the Glory of God, but according to Mr. Churchhill Jethro Bass had a grand way of doing it.

English Working Class Achievement

THE English working classes have four great accomplishments to their credit. Without any aid from the classes socially above them they have organized (1) the friendly societies which are so interwoven in English working class life; (2) the trades unions, which have achieved so much for the men engaged in manual labor; (3) the co-operative movement, which has so largely revolutionized retail trade and the distribution service generally among the working

classes; and (4) the political labor movement, which is now represented by forty-two members in the House of Commons. There is no accepted history of the friendly societies which brings the story down to the present time; the labor movement in politics is as yet too new to have its standard history, but Mr. George Howell, ex-M. P., and Mr. and Mrs. Sydney Webb have written the history of the trades unions; and the history of co-operation was the great literary achievement of the late Mr. George Jacob Holyoake, who died at Brighton only a few months ago.

Mr. Holyoake's first history of the co-operative movement, which, like the present issue,* was in two volumes, was written as far back as 1875-79. The revision of this work was completed only as recently as January, 1906; and Mr. Holyoake did not live to see the publication of this second and revised edition, which carries the story of co-operation in England and Scotland down to 1905.

The co-operative movement as it has been developed in Great Britain easily divides itself into two phases—the Socialistic and Utopian, which came first, and the intensely practical and magnificently successful phase which dates from the Rochdale experiment of 1844. This is the phase to which Englishmen refer nowadays when they speak of co-operation. This is the movement which is represented by large retail stores in almost every industrial community in England and Scotland, and by the Co-operative Wholesale Societies of Manchester and Glasgow, which between them are now doing a trade of twenty-three million pounds sterling a year—societies which since 1868 have turned over £344,425,000, and have gone largely into ship-owning, manufacturing and importing, and have achieved success in almost every manufacturing and distributing venture in which they have embarked.

All this activity had its beginnings in the association of a few weavers and artisans at Rochdale in 1844. The movement was then entirely of the wage-earning classes. The lower middle classes came into it as time went on; but while the movement has been imitated by the more well to do, as in the case of the Army and Navy and the Civil Service Stores in London, it has from the first been an exclusively working and lower middle class movement; and judged from any point of view it is the greatest achievement of the English working classes. They have sought for no help from the classes socially above them. Patronage, as that word is understood in England, has never had any place in co-operation; and co-operators have had no assistance from Parliament, except as regards laws for the protection of their funds, such as have been passed to the same end for friendly societies and trades unions.

No one can be said to understand social conditions in industrial England who has not grasped the true meaning of the co-operative movement and the influence which it has had in enhancing the self-respect of the more thrifty of the English working people. What co-operation has accomplished and what it stands for is brought out in the fullest detail in Mr. Holyoake's history; for no Englishman who was gifted as a writer was more in the co-operative movement than Mr. Holyoake, who writes frankly from the inside and as an admirer of co-operation and the successes it has achieved.

Wright's Life of Sir Richard Burton

Adolphus Trollope tells the touching story of a little boy who lamented that he was "always trying to be funny and it always turned out rude." Mr. Wright's fun, of which these volumes* present a large store, almost invariably turns out rude. He is so incredibly rude to Sir Richard and Lady Burton that one wonders why he should have concerned himself at all with persons of whom he has, in spite of intermittent adulation, so bad an opinion. He is "rude" to all Sir Richard's most distinguished friends; to Arbuthnot, the Maecenas of Orientalists; to Weil, a prince among Oriental scholars; to Lord Houghton, to

* The History of Co-operation. *By George Jacob Holyoake.* Revised and completed. Two volumes. Pp. xiv, 691. New York: E. P. Dutton & Co. $5.00.

* The Life of Sir Richard Burton. *By Thomas Wright.* New York: G. P. Putnam's Sons. Two vols. $6.50.

Sir Charles Napier, to Alfred Bates, to Speke, to Lane, to Steingass. Even the mere "supers" of the drama cannot be put in the play-bill without some discourteous epithet, which can give no one pleasure, and may cause unnecessary pain to their friends. Sir Richard's tutor is an "ox-like man"; his sister's governess a "peony-faced lady"; the professors at Oxford in 1840 were "dull, snuffling, smug-looking and fussy"; his companions "raw, limitary" (whatever that may be) "and priggish." He learnt Hindustani from a "dirty, smoky, Scotch linguist," and English from a "burly savage." The names are given in every instance.

Mr. Wright seems to have had no acquaintance with the Burtons, to know nothing of the East or of any Oriental language. Some of his informants, or, as he not unsuitably calls them, "informers," seem to have contributed very reluctantly to his work, and of others he seems to know but little, as his descriptions of them are extraordinarily inaccurate.

Upon almost every page he ridicules and sneers at Lady Burton, to whom Sir Richard was faithful in courtship for ten, in marriage for over thirty, years, whose name should become a classic for wifely devotion, a woman of extraordinary beauty and talents, a marvelous linguist, of social charm which will be long remembered in many circles of London society, most of all by other women, altho we have Mr. Wright's assurance, in three separate footnotes, that she was "always unjust" to her own sex.

When it is remembered that Burton spoke twenty-six languages besides dialects, that at twenty-two years of age he was so perfect in Hindu learning that he was officially allowed by the Brahmans to wear the Brahminical thread, that he traveled in India as a native merchant and as a Pathan doctor, that he penetrated as a Moslem pilgrim into the holy city of Mecca, which would have meant instant death had he been discovered; that he traveled in unknown Harrar as an Arab sheik; that he translated from various African dialects, from Brazilian, Spanish, Italian, from various Indian dialects, from Latin, from Ogham Runes, from Arabic of various periods—about thirty volumes in all—remembering all this it is a little surprising that Mr. Wright should have discovered that Sir Richard Burton was not only incapable of real literary work of any kind (he published over fifty volumes), but of translation in particular. While allowing that he was the greatest linguist, traveler, ethnologist and anthropologist "England has ever produced," Mr. Wright asks us to believe that Burton's magnum opus, the translation of the "Arabian Nights," was really the work of his friend, Mr. John Payne. Mr. Payne himself published (with Burton's help, for which he refused payment) a translation in 1882-84, dedicated to Burton. Burton had for years been collecting material, not in a London study, but in Arabia, Syria and Egypt, for the same work, and tho expressing great admiration for what Payne had done, saw no reason why his own work, about which he had long been in correspondence with the first Arabic scholars of the day, should not go forward, especially since Payne had, for bibliographical reasons, pledged himself to a limited edition, and 1,500 subscribers had been disappointed. Burton's edition appeared in 1885-6.

Many will still remember the excitement it created and the enormous amount of writing and discussion to which it gave rise. Swinburne made it the subject of one of his most beautiful poems, the walls of the next Academy teemed with pictures illustrating this new world of thought. The immediate financial profits were $80,000, and the expurgated edition brought out by Lady Burton for family use produced $15,000 more. Mr. Wright's evidence that Burton merely copied from Payne, with a few additions and substitutions (all for the worse), is that the translations are often very much alike, as is apt to be the case with any two good translations. Considering the use he has made of it, one cannot wonder that Mr. Payne was "extremely reluctant" to enter into a communication with Mr. Wright upon the subject, and that it required several letters and interviews before he "at last induced him to give way."

The book is copiously illustrated, mainly with views and portraits entirely irrelevant.

The Religion of Babylonia and Assyria. By Morris Jastrow, Jr. Revised and essentially enlarged by the author. Giessen, Germany: Alfred Töpelmann.

This work, first issued in this country by Professor Jastrow, of the University of Pennsylvania, is now issued in German, the title of which we translate above. It is greatly enlarged, so that it will be in two volumes, of which one has already appeared, at ten marks, and the ninth *Lieferung* is before us at one and a half marks. Professor Jastrow is especially developing, with new translations of various tablets, the magic, the prayers and the oracular responses. We heartily hope that this new edition, so invaluable to the student of Oriental religion, and of comparative religion generally, may give occasion to a second equally revised edition in English. The only thing we miss is the desirable figures of the gods as given in the sculptured monuments.

Letters to "Ivy" from the First Earl of Dudley. By S. H. Romilly. Longmans, Green & Co. New York and London: Pp. 395. $5.

The first Earl of Dudley, who was the author of these *Letters to Ivy*—Mrs. Dugald Stewart—was one of many young men of aristocratic lineage who came under the influence of Dugald Stewart between 1785 and 1809, when he was Professor of Moral Philosophy at Edinburgh University. Dugald Stewart, during the twenty-four years he was lecturing at the university and receiving students as boarders in his house, really founded a school for statesmen and judges. Brougham, Jeffrey, Cockburn, Horner, Lord Henry Petty, afterward Marquis of Lansdowne, Lord Palmerston, Sydney Smith, Henry Erskine, Lord John Russell, Lord Ashburton and Sir Archibald Alison, as well as the future Earl of Dudley, all attended Dugald Stewart's lectures; and several of these men, like the Earl of Dudley, were of the Stewart household while they were in attendance at Edinburgh University. John William Ward, who became Lord Dudley and Ward in 1823 and Earl Dudley in 1827, lived with the Stewarts in the winter of 1797-8; and from 1799, when he went from Edinburgh to Oriel College, Oxford, until his retirement from public life and from society in 1832, he maintained a correspondence with Mrs. Dugald Stewart, to whom early in the letters he gave the name of "Ivy." Mrs. Stewart was Ward's senior by sixteen years; and altho the letters are couched in terms of affection and close intimacy, with scarcely an exception they could all have been passed around the table at Dugald Stewart's Edinburgh home or at Kinneil House, the old whitewashed mansion in Linlithgowshire, where, by the kindness of the Duke of Hamilton, the Stewarts made their home after Dugald Stewart had ceased to lecture at Edinburgh University. There are no letters from Mrs. Stewart—a circumstance which is to be regretted. Owing to the many gaps in the correspondence, editing the *Letters to Ivy* has been a task of more than ordinary difficulty. It has, however, been well done. The numerous connecting sections, more numerous and longer than is usual in a volume of letters, have been written with much care and discrimination. And the letters were worth this careful editing, fragmentary as they are; and as now published they can be easily understood by readers who do not happen to have an intimate knowledge of the ins and outs or the personalities in English politics and society and in the world of letters in the first thirty years of the nineteenth century. To such readers they will be appreciated rather for their wholesome tone, their really informing character and their literary charm than for the light they throw on the intricacies of English politics.

The Kingdom in the Cradle. By James Atkins. Nashville, Tenn. Publishing House of The M. E. Church South.

The author of this book is the editor of Sunday school literature for the Southern Methodist Church, and is among the number of men who may be elected bishops at the coming General Conference. The initial sentence suggests the author's undertaking: "Thoughtful men, in surveying the present position of Christianity in its hold upon the world, are questioning, some reverently, some irreverently, why it is that it has thus far failed to bring the race under its dominion." The chapters following

intimate the reason why, and offer an exposition of the policy of Jesus which would establish and insure the success of the Kingdom in this world. The notable feature of the book is that the author has written it in the spirit and intellectual fashion of his times rather than in the trite phraseology of a former time. He is a social democrat of the heavenly mind, who would give all men an equal opportunity for virtue and salvation from the cradle, and he has given his views with enough gravity and wit to commend them to thoughtful people.

The Prophets and the Promise. By the Rev. Willis Judson Beecher, D. D. New York: Thomas Y. Crowell & Co. $2.00.

Professor Beecher, of Auburn Theological Seminary, belongs to the older generation of teachers of Hebrew. A conscientious and diligent student, a man held in universal respect, he has been little influenced by the recent critical views regarding the Old Testament, and he is one of the few remaining scholars to whom appeal can be made for non-acceptance of the results of the higher criticism. Nevertheless, his Princeton lectures, tho advocating that Messianic prediction is the chief content of the Old Testament, are a marked advance on the ideas of prophecy of fifty years ago, when the writings of the prophets were valued almost solely for their supposed forecasts of detailed events in the life of the Messiah. Professor Beecher's definition of a prophet as a citizen with a message, a manly man on fire with truth, a leader in great doings and an interpreter of history, is not essentially different from the conception of more advanced students. But his interpretation of particular texts, such as the famous "virgin" passage in Isaiah vii, needs to be compared with that of the critical commentaries, and his view of the Hebrew literature as consisting chiefly of promises of a Messiah should be balanced with the utterance of Prof. Nathanael Schmidt in his recent "Prophet of Nazareth," that "the Hebrew Bible contains no prophecy of the appearance upon earth of such a personality as Jesus of Nazareth seems to have been." The truth may lie somewhere between the two opinions. To all endeavors such as that of Professor Beecher to read the Scriptures for one's self in their own light, to hold by the truth in older views and to improve upon it where possible, there should be given the most cordial welcome. It is not always the most radical who most serves the cause of progress.

The Growth of Christian Faith. By George Ferries, M.A., D.D. New York: Imported by Charles Scribner's Sons. $2.50.

Dr. Ferries's subject is not the development of Christian belief thruout the ages, but the attainment of faith on the part of an individual, and its growth to full and proper content and strength. He writes for those who find religion difficult, or who at least have difficulty with the prevalent Christian creeds, because of the convictions forced upon them by natural science and their occupation, to an almost absorbing degree, in material pursuits. The spirit of the author is excellent, kindly, sympathetic with those who cannot accept the authority of either Church or Bible, patient in the full and fair consideration of all obstructions in the way of honest belief, and yet optimistic and hopeful always that vital and real faith in a good God is possible to every earnest seeker.

Dr. Ferries believes in full consideration of every Christian doctrine, in the light of the widest and best knowledge up to date, and he does not make the mistake of demanding too much dogma of a beginner nor attempting to force an entire doctrinal system upon one who feels the force of but a few of its truths. In this spirit he seeks to show how one can make natural and healthful progress to full enjoyment of the Christian verities, and how such large matters as miracles and the supernatural, forgiveness of sin and atonement thru Christ, should be approached and understood. The book contains much helpful truth and sound counsel, but the author lacks grip of his subject as a whole, and particularly power of co-ordination and arrangement of his thought, so that the work lacks clearness and cleanness of presentation, and orderliness of argument and instruction. It has the appearance of the first draft of what might be made a very good

book, if a more logical scheme or plan could be found, discussions not germane to the main theme expunged, and that theme—how a man of today can find his way to the Christian God—gripped a little more firmly and thought out to a finish with somewhat greater thoroness.

Literary Notes

THE best description of the old San Francisco, a city that was passing even before the earthquake and the fire wiped it out, was written three days after the disaster by Will Irwin. It is a description so lovingly written, so full of local color and life, that we are glad to see it published in book form under the title of *The City That Was*. (B. W. Heubsch, New York. 50 cents.)

....The heart of the book-lover will be gladdened by the announcement made by Putnams of their new *Iroquois Edition* of Cooper's Complete Works in 35 volumes. The introduction by William Crary Brownell defends Cooper against the conventional charges that his red men are too noble, his women wooden and his romance artificial. The edition is illustrated by Darley's original steel engravings and by modern sketches.

....The art which makes the advertising pages of modern magazines as readable and often more profitable to read than the purely literary matter has been so recently developed that many readers are not even aware of its existence, and certainly know little of its principles and methods. To such people the book entitled *The Principles of Practical Publicity*, by Truman A. De Weese, will be a revelation, while to the man who has anything to sell it will be a good investment. That the author is a man who knows his subject is evidenced by the fact that he has thrust the new-fangled food he advertises into the most conservative mouths by skillful advertising. This discussion of the relative advantages of the different forms of advertising and how to make the most of space is illlustrated with numerous examples of successful publicity. It is unnecessary to say that he is an interesting writer—every good advertising man has to be nowadays. (Published by the author, Buffalo, N. Y. $2.)

PATRIOTIC BLOOD.

His great-great-great-grandfather crossed the Delaware with George,
And in his country's service lost two toes at Valley Forge,
Where the frost king, keeping busy all that dreadful winter thru,
Very nearly did for Freedom what the British failed to do.

His great-great-grandpa nobly put his private cares away
And, hurrahing for his country, went with Jackson to the fray;
Many a crimson-coated warrior he dispatched to kingdom come
On that great day at New Orleans, where he bravely lost a thumb.

His great-grandad was eager, when his country called, to go,
And, with "Rough and Ready" Taylor, he did things in Mexico;
After humbling Buena Vista he assailed Chapultepec,
Where he lost a collar button and a section of his neck.

When the guns roared at Fort Sumter his grandfather tarried not,
But went forth to save the country, bravely facing shell and shot;
He did wonders at Antietam, fighting under "Little Mac,"
And at Bull Run he was foremost till he fell and sprained his back.

His father was no laggard when poor, bleeding Cuba cried
For the precious boon of freedom that so long had been denied;
Like a knight he marched with Shafter, and was nearly put to rest
By an army mule that kicked him in the stomach at Key West.

And our hero, the descendant of the warriors listed here,
Though a child, has nobly given up three teeth and half an ear;
Cheer him, cheer him for the service that he nobly does the state,
He may yet get blown to pieces on the day we celebrate.
—*Life.*

Editorials

"No Labels"

SECRETARY WILSON, who, as head of the Department of Agriculture, has the duty of enforcing the new meat-inspection law, says the packers will get no labels if they resist in any way the work of the inspectors. That means that the law will thus enforce itself, for the packers cannot send out their product without labels; that is, they can do no business, can make no sales. Secretary Wilson has three million dollars to execute the law with, and he will have a plenty of inspectors, and they will watch the process from the hoof to the can. The packers will be required to secure absolute cleanliness and decency, so that the public can be assured that the meat offered in the markets is in a fit condition for food. If in any way the packers try to hinder full inspection they will get no labels; they will be shut out from the market. So everything now depends on the faithfulness of the inspection. We believe the inspection can and will be made thoro and honest, altho we remember the complaints against the cotton reports in the same Department.

The packers have had a severe lesson, that kind of a lesson which ought to teach them that decency, as well as honesty, is the best policy, and cleanliness next to godliness. They have been held up to disgrace before the whole country and the world. The complaints against them have been proved, and there are yet other reports, no less severe, that have been withheld from publication. Enough has been discovered and published to cover the packers with shame; and, what concerns them more, their profits have been seriously affected. Their sales in this country have been reduced, and those abroad almost cut off. One European nation after another has shut the doors against them. The action of our Government in thus diminishing our exports for a season has been courageous and self-sacrificing, and in the line of that absolute honesty which should control nations as well as individuals. But is has further stirred up other countries to inspect their own packing-houses; and they have found in England, and we presume elsewhere, that the same evils exist.

In the end this exposure will not injure the meat trade. People will have meat, and they will have more than is good for them. The vegetarians may be right, and their sentimental argument is as strong as their hygienic, but it will be long before they correct the taste of the people. The assurance of good and honest inspection will satisfy the people before long, and the foreign trade will return. People will buy where they can get their goods cheapest.

It is interesting to see how the national Government is extending its authority. This duty of inspecting and so controlling the abattoirs in Chicago would not have been thought any part of the concern of Congress a few years ago. That would have been supposed to be the exclusive duty of the Legislature of Illinois. But that provision of the Constitution which gives Congress control of interstate commerce is of tremendous and unsuspected scope. It is that which has given Congress the right to control railroad rates and forbid discrimination. It is that which makes it illegal for a State to prevent the sending of liquors from one State to another. And now it allows Congress to put inspectors in every packing-house which expects to market its products outside its own State. Just so a pure-food bill can be enacted, because the food is to cross State lines. And the beauty of it is that now nobody objects to all this centralization. Even those States which have fought for State rights are so thoroly converted that they join in the most drastic provisions. They have learned to care more for people's rights than for those of their States. They want the labels which assure them of good food in their kitchens and on their tables.

We have not yet come to the end of this centralization. We are not so local in our interests as we were a hundred or

even fifty years ago. It is the extension of rapid communication which is breaking down the lines of division. Towns or cities cannot control trolley lines, because they run from one town to another. The State cannot own the railroads, as Mr. Bryan advised a few years ago, because the railroads do not respect State boundaries. By the necessity of things, with the growth of railroads, trolley lines, telegraphs, telephones and all sorts of internal commerce the county absorbs the power of the town, the State that of the county, and the National Government that of the State. So we have to interpret our Constitution to suit our necessities, and the Secretary of Agriculture puts labels on the tin cans of Packingtown, and other kinds of food will follow the same line. One of these days the National Government will own the railroads and telegraphs and telephones and other public utilities, as the little colony of New Zealand is setting us the fullest example.

The Disadvantages of Durability

Amid the general deploring of the destruction of San Francisco there is often heard one compensatory suggestion, that the sweeping of the site clear of the old buildings by fire will ultimately prove to be a benefit, for it will permit its rebuilding in an improved form. In proof of this Chicago and Baltimore are pointed out as examples of advantages of such wholesale destruction. This calls attention to a fact often ignored, that durability is not in itself to be regarded as an advantage in all cases. All progress involves change, and change is hindered by the permanence of material forms. Therefore as civilization advances and progress becomes recognized as a factor in it, permanence is seen to be an impediment and the tools and trappings of life are made less durable. A visit to a museum, the only place where durability is a positive advantage, will show this. The furniture of our ancestors was heavier and solider than ours, except where fashion has dictated a temporary reversion to earlier forms. Their books were printed and bound more durably. Their machines and utensils were more substantially built. Their clothing and houses were made to last longer, much longer in many cases than they should have lasted.

Perhaps our ancestors did this because they were more conceited than we are. They had less confidence in us than we have in our descendants. For we now believe that our children will understand better than we the art of living and will think our appliances crude and unsatisfactory. In fact we hope that we ourselves may live to outgrow them and discard them as we have others. We could not stand it to live in a medieval palace and we hope that posterity will find our finest mansions cramped, inconvenient, ugly and unsanitary. He who builds an edifice to last five hundred years lacks faith in the future. The medieval cathedral builders were conspicuous for this lack of faith. They did not believe that posterity would devise any better form of worship than that they knew, and in most places their lack of confidence in the religious evolution of their descendants has proved justified. Those who raised the pillars of Karnak thought that the worship of Osiris would never die, and those who laid the stones of the Parthenon believed that so long as they remained one upon another processions would go up to lay the peplus upon the knees of Athena.

So we when we build an unnecessarily substantial capitol or cathedral are presuming to dictate what shall be political machinery and the form of worship of the people who are to live in this land hundreds of years hence. The Houses of Parliament, built fifty years ago and costing $15,000,000, are already absurdly inadequate for their purposes. The House of Commons is too small and the House of Lords too big, because Sir Charles Barry, its architect, did not foresee the development of democracy. He was not to blame for not foreseeing it. He was only to blame for thinking he could. Many of our public buildings are about as bad. The magnificent post-office building recently erected in Chicago was antiquated before it was completed on account of the improvements in the methods of handling the mails. The temporary brick building without architectural pretensions was so much

more convenient and economical in running that the clerks objected to moving into the new edifice prepared for them. In New York a lot with a building on it more than twenty years old is apt to be worth less than a vacant lot.

The colleges of Oxford are the admiration of tourists who see them from the outside, but our American Rhodesians who have to live in them find them painfully lacking in the conveniences and decencies of modern life. Ancestral manors are very delightful as residences provided one can have his rooms in the new wing. It seems to have been a very common error of our forefathers that we would want to live in their houses. We don't, but we often have to. The further back we go in historic times the more dominant this error and the more substantial the buildings. No more enduring mass of masonry can be constructed than the oldest building known to us, the Egyptian pyramid, and we are obliged to admit that it was perfectly satisfactory to its tenant for some thousands of years. But that was because Cheops was a dead man all the time he lived in it.

It is because good buildings are unfortunately so expensive and enduring that architecture is more backward than the other arts. It cannot, by the nature of its material, keep pace with increase in knowledge and advance in taste. Consequently our streets are disfigured with anachronistic architecture. We do business in Greek temples, worship in Gothic churches and live in Renaissance chateaux. Our flats are all made to fit the average family and the result is that the family has to be made to fit the average flat. Thus the Procrustean rule of the builder regulates the evolution of the human race.

We bring out these instances to show that permanence in buildings is not a desirable quality in itself, but rather a necessary evil, and as such to be deplored and minimized. No way out of the difficulty is yet in sight. The Japanese dwelling house, quickly and cheaply built of wood with movable paper partitions, presents some attractive features, but is manifestly impossible in our large cities and with our mode of life. Possibly some relief may come from concrete construction, which promises to furnish us with a more adaptable and serviceable material than any before used by man. Perhaps, also, some way of utilizing it may be devised so that a building will last as long as it is wanted and no longer.

In the case of clothing, the prospect of more ephemeral material is better. The days when the leathern jerkin was handed down from father to son, and the mother endowed her daughter with her silk dress, are gone forever. Our merchants do not find it advantageous as formerly to claim that the clothing they wish to sell will "last a lifetime." They have changed their allurement and now tell us that "it is so cheap you can afford to throw it away whenever you get tired of it." This shows a great progress toward the recognition of the evil of durability. The qualities to be desired in clothes are comfort, cheapness, beauty, convenience, cleanliness, style, protection, and the like. But durability is not among them, except insofar as it is necessary to secure one of these positive advantages, especially cheapness.

We ought never to wash our clothes. It is a very disagreeable, expensive and ineffectual process of purification. Burning is far better. If clothing were cheap enough and easily obtainable we would never think of wearing the same garment twice. Already this ideal is practicable, to a great extent. Handkerchiefs, collars and socks, made of paper or cheap cloth and thrown away after use, would now be preferred by most people of nice habits were it not that fashion, always aristocratic, that is to say, reactionary, in its tendency, decrees in favor of the old-fashioned and unsanitary durable materials. But progress toward the perishable cannot be altogether prevented. A substitute for leather, cheaper and less durable, will probably be invented. Wood pulp and other paper fiber can be utilized in innumerable new forms. Soon we shall be able to discharge the silk worm, for it cannot compete with a machine which spins millions of threads from a barrel full of collodion.

A suit of clothing, to be perfect fitting and clean, must constantly be destroyed and renewed. Such a suit we have as our skin, which is continually changing and is completely renewed at least once a month. Upon this ideal of nature we

should model our artificial integuments, our clothing and our houses.

The Social Inspiration of Art

By far the most serious and satisfying estimate of the success and failure that marked the life of Stanford White, which has thus far appeared in the public prints, was an editorial in the *Evening Post* on "The Artist in Our World." Generously recognizing the extraordinary gifts of this man, so tragically removed, the writer attempted to find a more than superficial explanation of White's failure to achieve a great total of artistic creation. Other artists have, like him, yielded to temptation, yet, with no greater genius than his, they have left a large product of imperishable work. Something more than the weaknesses of individual character, therefore, must be sought in explanation of this particular case.

The explanation offered by the *Post* is unquestionably, within its limits, the true one. The social world in which White lived, and within which he found his patrons, was not sufficiently advanced in its own knowledge and appreciation of art to call forth persistently and insistently the noblest efforts of the greatest minds. New to the enjoyment of opulence, intoxicated with novel pleasures, unfamiliar with the art of the past, and without critical standards, it needed itself to be inspired and led. It could not remorselessly demand. In such a social world, the artist of austere character, serving no gods but those of art, might conceivably force upon his patrons work of the highest order, which they could but imperfectly understand. And by so doing he might gradually exalt the taste of his generation. But the artist fond of the pleasures of life as much as of his work finds himself in such a world easily falling below his own ideals, and gradually surrendering to other allurements than those of creative activity. The American public was not ready to make the most of a Stanford White, or even to afford him the opportunity to make the most of America.

This explanation, we say, is true within its limits. But it leaves something still to be said. We must look yet deeper into the sources of great art, and of the achievements of its greatest creators, before we can fully understand how easy it is for the world to lose much of the best that is always easily within its grasp. In every age gifted men are born, only to perish before they find expression in enduring work, and it is not merely because the community in which they appear is crude that their talents run to waste.

No really great art has ever been bequeathed to mankind by an intensely individualistic community. It is true that there have been individual patrons of art, princes of the state and of the Church, rich merchants of Venice, of Genoa and of Holland, who have lavishly bestowed their wealth on the best artists of their day. But the art thus called forth has not been supreme, and there is not the slightest reason to suppose that in this New World, any more than in the Old, the patronage extended by plutocrats, even tho they should presently acquire a critical knowledge, will ever inspire and sustain an artistic activity that will place our land among originators of the noblest works.

Great art is a product of the communal, the public, spirit. The greatest artists have created for the public, not primarily or chiefly for individuals. The Parthenon was a civic and religious temple, and the thousand lesser temples of Athens, of Corinth, of Syracuse, were, like the Parthenon, an expression of the social spirit in its freest and noblest manifestations. Even in Rome, the proud city of wanton personal luxury, it is the creations of the social spirit that survive in colossal grandeur to the present day. The Forum, the Coliseum, the Aqueduct, these were for the people and of the people. The almost equally sublime creations of medieval and of Renaissance art tell us the same story. The castles of Normandy and of the Loire, not less than those along the Rhine, doubtless may be classed as products of a ruthless individualism, but not so Saint Etienne du Mont, the Notre Dame, the perfect Amiens, or the unapproachable Cathedral of Cologne. No individual baron, of war or of commerce, called forth these. The common people

reared them, and even the names of their designers and master workmen are in most instances forgotten. Florence was a town of mighty merchant princes, and they were generous patrons of art. But it was collectively, as a community, that they reared the Duomo of Giotto and Brunelleschi. At Milan one may see the soul of individualism in the gloomy brick and mortar of the old castles, but it was not individualism that wrought the Saint Ambrogio and its Palliotto, or San Eustorgio, or the exquisite Certosa di Pavia. Even in the ruder period of Italian art, the same contrast between the littleness of individualism and the sublimity of the collective spirit may everywhere be seen. Go, if you doubt this, to old Verona. Stand by the tombs of the Scaligeri—of Martino II, Can Grande II, Alboino I, Bartolomineo and Can Signorio — arrogant lords, ruthless spoilers, and be impressed with their glory and the workmanship if the artists whom they commanded, and then, when you have seen it all, go across to quaint and rare San Zeno, and ask yourself which assures you of the deeper artistic inspiration.

Some day, in America too, we shall have a noble art. But it will not be while the individualistic spirit is as rampant as it has been and still is. It will not be while the most cultivated critics that we have get no further in their social philosophy than the writer whose partial explanation of our present shortcomings suggested these reflections of our own. But the public spirit exists in our land. It will grow more and more. It will take over from our individualistic lords and masters some of the economic privileges which they illegitimately enjoy, and in thereby cutting short the career of some would-be patrons of art will breathe the breath of life into a people that, in its growth and aspiration, will become, like public-spirited peoples of old, artistically creative. Let us not commit the folly of some strangely blinded critics, of apologizing for the plutocratic spirit in the expectation that from such a source an American art will spring. We shall have great artists when we have a great public to call their genius into creative life.

Summer Schools

CHAUTAUQUA led the way. It was a stroke of genius on the part of Bishop Vincent. The beginning was humble, but the fulfilment is already a marvel. Best of all it has led the way toward liberality and good fellowship in theological as well as educational affairs. Greenacre of the Piscataqua followed on a somewhat more radical basis. Down in Maine the sentiment was more strictly to create a comparative study of religions and to bring about a unity of fellowship. Great music has always been a feature of the Greenacre conferences, and here have resorted many of those sick hearts that needed healing more than teaching. Thomas Davidson's school in the Adirondacks aimed to gather into a circle of intimate friendship a few hungry seekers for truth and right. His maxim was "Remember that Heaven itself can be nothing but the intimacy of pure and noble souls." The Concord school, with W. T. Harris as leader, was more deeply philosophical, and its debates would have honored the Academe of Athens.

The old-fashioned college held its Commencement late in July; sometimes in August. Gradually this graduating day retreated out of the summer months and is now to be found in the middle of June. The winter vacations have shortened, for in these days very few boys go out during the winter months to teach—thereby helping themselves to pay their board bills and term accounts. It is due to this change that so many of our colleges and universities are now carrying on summer schools. Not a little, however, is due to the growth of interest in scientific studies. These have not yet secured complete recognition in the regular curriculum. Agassiz's summer school at Penikese Island was an expression of the conviction of that great teacher that our college courses needed supplementing. Then came the Marine Biological Laboratory at Woods Hole. Now there is scarcely to be found a college in the United States or a normal school that does not hold a summer session. The Yale school we note offers courses in anatomy, art, biology, chemistry, commercial geography, education, geology, languages, mathematics, physical educa-

tion, physics, physiology, psychology, rhetoric and school administration. This is a fair sample of what is offered by the State and municipal universities, both East and West. We have before us a list of about twenty-five such schools in the Eastern States and about the same number in the Western States. More notable perhaps is the fact that the Southern States are holding a number proportionately as large, besides midwinter schools of the Chautauqua sort. These occur during the tourist days, and receive attention fully equal to that of the Northern Chautauquas. Our original Chautauqua has, by the way, biased its courses of late quite largely toward domestic and craft sciences. It has a department of physical education, another of practical arts, another of arts and crafts and still another of domestic science.

Far above the level of the sea, altho still in a valley of the Tennessee River, surrounded by mountain peaks, is held perhaps the most remarkable of all the summer schools of the United States. About forty States are represented, with nearly two thousand in average attendance. The students consist of teachers from kindergartners to university professors; and the work of the school covers topics adapted to every grade from the primary school to philosophy and higher mathematics. Nearly one hundred and fifty courses are offered. Special attention is paid to drawing, music, nature study, manual training and economics. This school, like that at Greenacre, makes much of music. Some of the most famous singers, heard elsewhere only in the larger cities, are present. This is possible because these schools offer a true vacation retreat, with every possible combination of rustic retirement with modern conveniences. Held in association with the University of Tennessee, rooms and board can be had at a low cost. Perhaps the most interesting feature of this school is the creation of a National Gild of Play and the recognition of play as an important method of education. A unique, and we believe a very important, feature is another gild, or league, of national story-tellers. The field work is the more prominent, and probably the most important. Work is done with note book and pencil as well as with tools. One may look from the hights where this school is gathered one hundred miles to the west and then again to the east. It is an ideal spot for the friends of education to gather from all quarters of the country.

This general movement has reached over to take possession of some of the summer camps of the Young Men's Christian Association. Two weeks ago over six hundred college boys met at Northfield and last week Yale had a conference at the beautiful foothills of the Berkshires, at Lakeville, Conn., where nearly two hundred of her students attended. The clean, modest, manly, earnest faces of these young Yalensians was one of the pleasantest sights the present writer has ever seen. And the girls of the Young Women's Christian Associations, who had their conference at Silver Lake the other day, were almost eight hundred in number. Dr. Henderson's Marienfeld summer camp for boys is a splendid development of the same thought. A few of the churches are also already in the field. The pastors may still hold on to their summer vacation, but not a few of them believe that their vacation can coincide with a good deal of nature study and instructive work. Abraham Lincoln Center, of Chicago, which, by the way, is a church, sends out a midsummer bulletin, which announces not only a series of summer church lectures, of a very practical sort, but an extension school to be held on the banks of one of the Wisconsin lakes. There will be classes in religion and other classes in domestic economy, while literature will be dispensed to audiences of a somewhat transitory sort. We note that Browning is a specially favored author. In domestic science, cooking, hygiene, home nursing, dietetics, sewing and millinery will all be taught. Will this become the ideal church vacation, when the pastor takes with him into the country a good portion of his city auditors, and enlarges his sphere of influence? Will he be worn out more rapidly by this sort of vacation life than by the ordinary exhaustion of having nothing to do except to enjoy himself?

We have to note that these summer schools, unlike our colleges and universities, are devoid of traditions. This is

true not only of their methods, but of the notable absence of such inheritances as hazing. There are social functions of a natural sort, impromptu as well as inexpensive; but athletics, as far as the present, is not known by intercollegiate games. The time is fully occupied with eager students, who do not need the supervision and authority of a board of government. The methods remind us very closely of the original university, as it existed in the time of Abelard. There are rules, but they affect only the convenience, and the more ready acquirement of knowledge, on the part of students and teachers alike. Instructors are themselves also pupils, and this is wise, for in reality true education never ends. Adults are quite as much in evidence as young people. Many executive minds, not elsewhere regularly utilized as educators, here are made available for splendid work. Perhaps the most prominent feature of these schools is self-direction; and as a consequence there is a strong tendency toward the acquirement of that faculty, which is so seriously lacking in our college training. The bias is, of course, strongly toward what we have learned to call nature study. Object lessons are everywhere, and the true, which underlies the beautiful in the open fields everywhere, is revealed. So the summer school is getting to be an established feature of American life; and it is enlarging and enriching the sphere of education. Altogether they constitute a natural evolution of new thought and new aspiration. They may at some time coalesce, and constitute a complete system, covering the whole of the United States.

Lyman J. Gage Among the Theosophists

Mr. Lyman J. Gage was a successful bank president and a skilled financier, who was made Secretary of the Treasury. He is now retired from business and politics, and has gone to California to live in a Theosophist colony at Point Loma, presided over by one Mrs. Tingley, Purple Mother of the Universal Brotherhood, who, after various metempsychosical births and rebirths in which

"Initiate, mystic, perfected, epopt,
Illuminate, adept, transcendent,
[She] ivy-like lived and died, and again lived
Resuscitant,"

has again revisited these glimpses of the moon. In this her present sojourn on the planet she bears the name of her third husband; and the spirits of Madame Blavatsky and of William Q. Judge have entered into her, and very likely seven other spirits worse than they, if possible.

And Lyman J. Gage is reported a disciple, persuaded by his wife, and will learn the incomprehensible mysteries of the Yogi philosophy. Having reached the age of threescore and ten, and having laid aside the business whose science he knew by careful experimental study, he becomes a pupil in a subject to which he had paid no attention, and says he "would consider it honorable to be related" to Mrs. Tingley's Raja Yoga school.

And what special qualifications has Mrs. Tingley to teach Lyman J. Gage, or any other old or young pupil, apart from what she says she acquired in her reincarnation? She was brought up in a saloon, educated in a convent, and married first a printer, then a saloonkeeper and for her last venture a stenographer. She dabbled first in hypnotism and spiritualism, gave seances, then joined Mr. Judge, who was, with Mr. Olcott, after the death of Madame Blavatsky, the head of the Theosophists of the world. When Mr. Judge died the organization went very much to pieces, and Mrs. Tingley claimed the succession and gathered certain fragments about California, which is nearer the original source of the mysteries, in India. She was known for a while as the Veiled Mahatma, but in 1898 she became supreme head of the Brotherhood, and is recognized as the inspired successor of Confucius, Buddha, Jesus Christ and Mohammed.

There is not an essential and peculiar teaching of theosophy which has a particle of evidence behind it. It is utter assumption and spun moonshine, spun out of the busy idleness of a dreamy brain. Its central doctrine is the reincarnation of souls; but what proof is there of it? Not the slightest. Only some old droning fakir, spent with a year's contem-

plation of his own navel, conceived the idea; and others, who knew no more, declared that so wise a recluse and philosopher must know, and they believed him; and the doctrine grew in India, and then Mrs. Besant and Colonel Olcott and Mr. Judge, who thought there must be truth in what was past comprehension and lacked proof, accepted the system and found followers as credulous as they. Every other doctrine, like metempsychosis or like the Hindu foundations of the world, rests on an elephant, which is on a tortoise, which is on something else, and so on, until the lowest one rests on—nothing. The astral body, which is the form on which the physical body is built, is one of these notions. They are baseless, unproved, quite imaginative, where they can be understood. Let us quote a luminous statement by Mr. Judge, taken from his exposition of theosophy:

"In manifesting itself the spirit matter differentiates itself on seven planes [why seven?], which are of progressive density down to that within our sensuous perception [how does he know about what is above our perception?], the substance in all being the same, but differing in the preparation of its two compound elements [spirit and matter]. Thru all thrill ceaselessly vibrations which are the inexhaustible impulse from the First Cause. These vibrations are distinct, each from all the others, and each always the same in mode upon every plane, but differing in rate according to the rarity or density of the substance of the plane."

How perspicuous! And how does he know? This is the spinning of the cobwebs of moonshine, without science or sense; and this is the stuff that the ex-Secretary of the Treasury in his old age has gone to learn, but even more muddled by the maunderings of a mistress of occultism and hypnotic seances.

How is this to be explained? And equally how do we explain the attraction of other inspired claimants to apodictic mystery, such as Mrs. Eddy and all the other teachers of the infatuations of Christian or metaphysical "science," with all their Hindu and Persian congeners?

It is partly to be explained by the general diffusion of ignorance. Mr. Gage's school life ended when at the age of seventeen he entered a bank as office boy. A multitude of others have no experience in the study of evidence. They know nothing of the methods of research. When they are told, with an air of pompous profundity, that a thing is so, they know no better than to take the word even of a charlatan. They must believe somebody, why not these who claim to know so much?

Another explanation is in the excellent ethics which the spurious philosophy adds to its teaching. All these cults, theosophy, Christian Science, metaphysical science, Babism, have taken almost unchanged the ethics of Christianity, and they furbish it up as something else, old as Buddha or Confucius or Zoroaster, the very essence of Brahma. In India these sects are recognized as reformations, either of Buddhism or Brahminism, like the Brahmo Somaj and the Adya Somaj; but here they quite ignore the Christianity which gives them all their worth. A man whose life has been spent with very little knowledge of Christianity has the supreme duties of love and self-sacrifice first brought to him under an unfamiliar name, and he must admire them, and, it may be, he accepts them, accepts the fruits of Christianity and does not suspect from whence they come; that what he has just learned is what the old Bible and the old Church has been teaching these nineteen centuries—only he did not know it. He may get the benefit of it, and become a genuine, but uninstructed, Christian, having learnt the doctrine under another name. The devils are cast out, but he follows not us, and we rejoice and forbid him not. We only regret the obfuscation of his philosophy, which he imagines is true, because the ethics is true.

These are the principal causes for the spread of such cults, which are not all bad and false. We might speak of the attraction to many minds of the vague, the transcendental and the mysterious; or of the passion which many rich and idle people feel to seek unusual paths which may lead to occult knowledge, especially of the future world. But let a man be once trained along the lines which consider the laws of evidence, and then let him be once suffused with the ethics of Christianity, and he is not very likely to wander along these byways.

The Battle With the Insects

The country editor has his troubles. It is not with trusts and rebates, nor with cyclones and hailstorms, but with insects —some of them small enough to class with bacteria, and hide in a can of breakfast food. It was in May, when the first leaves were hardly unrolled, and none of them were pressed out under the sad-irons of Mother Nature, that it became necessary to prepare kerosene emulsion and Bordeaux mixture. It was a question whether the currant worm or the editor should come out ahead in his garden. It is surely a shame to be whipped by bugs, and we were not. The whole family was called into council; the multitudinous worms were eating fast on the luscious vegetation. All science was on our side, but speed on theirs. One boy, on his bicycle, hastened for materials—hard soap and kerosene, to be dissolved and churned, with a liberal admixture of white hellebore, sulfate of copper and lime. Think of it, green atomies, the whole laboratory is arrayed against you; brains against instinct. Sprinkling this stuff on two acres of bushes was slow work. Another boy, with brains atop, invented a machine; a small barrel with spraying apparatus, to be drawn by a horse, and work automatically both to right and left. What chance has a worm or a bug or a sawfly in such a world as this! The editor's heart softened, but not to the melting point. Two hours of San Juan ended in a total rout of the enemy, and no prisoners.

Before this victory was complete the apple petals had fallen, and the codling moth was abroad—a delicate and fragile creature, such stuff as dreams are made of, a moonlight lover, but quite as fond of apples and pears. Left to themselves these light winged moths would monopolize our orchards, and interfere, not only with the editor's comfort, but with his income. In fact, this innocent looking creature has upset our foreign markets, as well as the home. For the sake of Berlin and Liverpool, as much as for our own apple-bins, we rig another spray-cart, this time to throw solutions of arsenic and lime over the tallest orchard trees. Every apple and every pear tree and every grape vine is to be thoroughly sprinkled, at least three times within the next six weeks. This is the baptism of Nature by the high priest Science. It is the beautiful and effective prayer of doing. As a result our Spitzenburgs and Baldwins are now expanding in clean beauty, suggestive of full barrels in October. The country editor feels warranted in counting this sort of chickens a little ahead of time, rubbing hands with considerable satisfaction. The foliage is rich, and the crimson begins to show on his McIntosh and the yellow on his pippins. He has eaten his own strawberry shortcakes; and a daily bowl of fresh milk, with dead ripe blackberries bobbing about among the homemade bread, is just now the order of the day. Between the spoonfuls he thinks generously and pathetically of those who abide in city offices, and tread the pavement instead of the sod. He knows where there are rows of glasses of currant jelly and gooseberry jam, preveniently stored for the fruitless days of winter.

But it has been a fight from first to last. Not a fruit, nor a shrub, nor a tree, but we have quarreled over—we and the bugs, but we have conquered every time. Imagine a Nature in which we had no rivals. It would end in stupid surfeiting, and in a deadening of the senses. So it is that we go to school, and are taught observation, comparison, alertness, precision and promptness, by the smallest of our rivals. There is not an insect that does not come in play to sharpen wit and make the senses keen. But imagine also the fate of those who held the globe before our fruits were evolved, when there was little to contend for. It matters little whether the vegetarian is right or wrong, in a day when apples are crabs, and potatoes are poisonous. What a wealth of evolution is behind us, and quite as much of it has gone to the making of us as we have participated in the making.

But philosophy is to be indulged only while we work. The charm of land culture is that one may think very fast while he labors. The brains and the hands can co-operate. Last night, while the air was charged with moisture, an invisible spore bore down upon our

orchards and vineyards, and touched millions of leaves with a tiny torch of fire. Can our science come in once again to the rescue? It certainly will undertake to solve any problem in nature, and will sooner or later provide a remedy for every ill. Bring out once more your apparatus for spraying with Bordeaux mixture, and do it quickly—for faster than the fleetest wings comes this anthracnose—Greek for fire. On different trees it changes its nature, and never works alike in vineyard and in orchard. It is a proud day for the landholder when he can walk to and fro, and command these enemies to disappear. As we near the end of the summer there are fewer enemies to combat, and after that the harvesting comes in. The bins are to be filled, and the door closed for winter.

The country editor has learned something about ethics as well as dynamics, for he has had his sphere of vision enlarged. He has learned to read the fourth commandment, with emphasis on the charge to do a good round six days' work, before he undertakes a Sabbath rest. He has got a new reading of "My Father worketh hitherto and I work." He sees out here in his garden that he is not separated from the crowd, but is nearer to the great people than when in a city, and it is from his garden and orchards that comfort and joy must be distributed. Here he is working, not for himself alone, but for those whom he can feed. He has found that the birds are his allies, and that the ravens feed every honest worker as generously as they fed the old Prophet; for his best berries are from plants sown by the birds. The robins sing for him and the fowls of the air work with him; but in turn he must work for them. The trees and the streams are his poets as well as his providers. There is nothing more universal than obligation. Nature has a habit of giving us just about enough, and not much over. If every tree bore its fullest crop, and every grain came to its maximum bushels, each year, we should surfeit the market and bankrupt our homes. Out of ten or twelve crops, which is about what we grow on an intensive farm, Nature averages a failure for two or three each season; but that always leaves enough. That tree that leans a little at the corner of the orchard gives us its ten barrels of apples, but only once in two years. On the bearing year it fills our cider barrel, and the surplus finds its market in some English family. Our cabbages will make sauerkraut for Berlin. It is curious how we swap ideas the world over, for in buying our fruit these folk also buy our science. We have equal need of theirs. So the shuttle of good will goes with the shuttle of trade and weaves the whole world together. By and by this sort of work will abolish battle-ships, and all such like humbugs. Our fighting will all go on in the garden. We shall know Burbank to be greater than any Napoleon, while Bailey will be Earl of the Empire State. It is a fine age this, whose armament is turned against the foes of the common people, without regard to nation or race.

The White Shirt-Waist

On the hot city streets every woman, except the one in mourning, wears a white shirt-waist. It is of thin lawn, and looks as cool as it really is. It is a sensible garment, that fits the hot season. It indicates the sense of the fitness of things that belongs to the sex which wears it. On the same city streets are as many men, and nine out of ten of them has on a long black coat, that looks hot, that is hot, that is as ill-fitted to the season as the feminine garment is becoming. It is not airy; it is stuffy. It seems to mark a lack of the sense of the fitness of things on the part of the sex that wears it. The only men that look cool are the working men who have discarded coat and vest and have thus arrived at the shirt-waist, and the street sweepers, who are all clad in cool white. Why is it that in Porto Rico, or the Philippines, or China, or Japan a man can go to any evening party in white linen, but here in the United States does not venture in summer to walk the street thus sensibly clad? The street garments of our men and women are an evidence that man lags far behind woman in the sense of propriety, the sense of comfort, and we suspect, in a good many other kinds of sense.

The "Altar Stone"

There are barbarians the world over, in Pennsylvania as well as in old Moab. Some forty years ago there was found in Dhibân, the biblical Dibon, capital of Moab, a stone with an inscription in Phenician letters, giving the record of the victories of a Moabite King, mentioned in the Bible, over his Israelite foes. It sounded just like a chapter from the Books of Kings. A squeeze of it was taken on paper, and it attracted great attention among scholars, not only on account of its contents, but because it gave us the oldest dated monument with the alphabet from which our alphabet is derived. But when a commission went to secure the stone for a museum they found that the fanatical Arabs had broken it to pieces, and much of it was lost. Those Arabs were angry about the attention it had gained, and so they destroyed a historical monument which time had spared for nearly twenty-eight hundred years. The other day an American Arab was guilty of similar barbarism in Millsborough, Pa. A so-called "Indian Altar Stone," covered with figures of animals, was a most interesting relic of a former race; but the owner of the land, provoked because visitors trampled over his field to see it, blew it up with dynamite the other day. In France all historical monuments are listed and protected by law. A Church cannot destroy or sell its old pictures or silver without authority. Every one of our States ought to have a similar law which would preserve such relics from vandal barbarians.

A Holy War

We do not much fear a Holy War, that Moslem Jehad which the British Parliament was warned against the other day. We do not doubt that in Egypt, as well as in India, the natives do not love their British rulers and would be glad to get rid of them, while knowing that they were never before so well governed. The reason is, that the British show a sense of aloofness, of distant superiority to the very proud people whom they rule. There is no fellowship of personal regard between them. We have the same difficulty in our colonies. But that does not mean that there is much danger of a Holy War, even tho the Sultan feels himself constantly humiliated, and lately on the Sinaitrè boundary dispute. A war of Islam against Christendom would speedily drive the Sultan out of Turkey and divide his possessions among the European Powers. It might make much trouble for awhile, and there would be massacres of Armenians, Greeks and Europeans in the Turkish possessions, but in India very little could be done, and as little in Egypt and the British and French Sudan, or in Algeria. The hold of France, England and Germany on Africa would not be in the least affected. We doubt not that the astute Sultan knows this perfectly well, and he would not dare to risk such a conflict which would bring political Islam to an utter end.

The plan for a colony for co-operative living which Mr. Upton Sinclair promulgated in THE INDEPENDENT of June 14th seems likely to materialize. Mr. Sinclair tells us that he has received seventy-five applications for membership, "none of them from cranks." He has called a meeting for organization on the evening of July 17th at the Berkeley Lyceum, New York City. It is an interesting experiment and in the right direction, but its success will not depend so much upon its plan as how it is carried out.

People complain sometimes because we send so many lawyers to Congress. It is not strange that we do, for lawyers ought to know most about making laws. But no one should criticise the plan in this city by which the lawyers put up a ticket for the Supreme Court of the county. They have nominated thirteen judges, and they will put their own ticket in the field for election. The lawyers know best who are fit to sit on the bench.

It is well that our Government will insist in making our Minister to Constantinople an Ambassador. We shall then have the right to demand audiences with the Sultan directly, and he will hear our complaints directly, and there will be a chance of their being heard.

Financial

New York Bankers' Meeting

THE annual convention of the New York State Bankers' Association was held last week in the Hotel Champlain, at Bluff Point. Lewis E. Pierson, president of the National Exchange Bank, of this city, was chairman of the committee on arrangements, and the president was Alfred H. Curtis, president of the Bank of North America. Mr. Curtis's successor for the coming year is Elliott C. McDougall, president of the Bank of Buffalo, in the city of that name. Prominent features of the meeting were addresses by Frank A. Vanderlip, vice-president of the National City Bank (New York), and Robert B. Armstrong, president of the Casualty Company of America and formerly Assistant Secretary of the Treasury.

Mr. Vanderlip urged the grave need of legislation which would provide a scientific system of bank note currency. In financial legislation, he said, we had been opportunists, rarely doing anything until driven to it by the stress of depression or panic, and then legislating with more haste than wisdom. Pointing out the lack of elasticity, he did not propose a complete plan of betterments, but said that two principles should be recognized —first, that there is no essential difference between a bank credit in the form of a deposit and a bank credit in the form of currency; and second, that adequate redemption facilities are a certain bar to an overissue of circulating notes. If it were politically possible, it would be desirable to have a central Government bank, whose chief function would be rediscounting for other banks. Thru such a medium the principles of a scientific asset currency could be worked out. New York bankers, he said, should accept financial leadership, which the country would give to them if they should assume the responsibilities of New York's financial position. They should study the currency problem, reach well-considered conclusions, agree upon a course to be followed, and go before the country in support of it.

Mr. Armstrong's remarks were in the main a defense of corporations against the "indiscriminate denunciation of sensational newspapers, political demagogs and professional reformers." He deplored the "willingness of the American people to string a corporation up to the nearest lamp-post." The tone of much of his criticism is indicated by the following reference to the beef investigation:

"Because a sensationalist wrote a book, a great industry was throttled over night. The man who wrote the book admitted that he did not care to improve conditions, but that he wrote it as a part of a Socialistic propaganda. In eagerness to reform all things, two estimable but impractical men made an investigation, and then the limelight was turned on. Foreign competitors, eager for any opportunity to assail American industry, seized the big stick, and under the glare of the calcium of sensational publicity dealt a blow to American packing house products from which it will take ten years to recover. Abuses there may have been; undoubtedly there were. And yet there are sincere people who believe that even a packer is entitled to some consideration."

The new officers, in addition to President McDougall, are: Vice-president, Charles Elliot Warren, cashier of the Lincoln National Bank; secretary, E. O. Eldredge, cashier of the New Amsterdam National Bank; treasurer, Hiram R. Smith, president of the Bank of Rockville Center, Long Island.

MORTIMER L. SCHIFF, a member of the well-known banking house of Kuhn, Loeb & Co., received at the Amherst College commencement the honorary degree of Master of Arts.

....The authorized capital of the Canadian Pacific road is to be increased from $110,000,000 to $150,000,000. Capital already issued is $101,400,000. To this, $20,280,000 will soon be added.

....The Liberty National Bank has transferred $500,000 from undivided profits, making its surplus $1,500,000. The Gallatin National Bank has taken $1,000,000 from undivided profits, making the surplus $2,000,000, the capital $1,000,000, and the undivided profits $306,971. The State Bank has increased its capital from $100,000 to $1,000,000: its surplus is $500,000.

....Dividends and coupons announced:

U. S. Rubber Co. (First Preferred, quarterly), 2 per cent., payable July 31st.

U. S. Rubber Co. (Second Preferred, quarterly), 1½ per cent., payable July 31st.

The Independent

VOL. LXI NEW YORK, THURSDAY, JULY 19, 1906 No. 3007

Survey of the World

Political Topics

Secretary Taft is going to the Philippines next spring, in order that he may be present at the opening of the new Filipino Assembly. This was made known in Washington on the 13th, and was generally regarded as an indication that the Secretary would not accept a place on the bench of the Supreme Court, but would be a candidate for the Presidency. On the other hand, he had said in Detroit, on the 11th, that he was not a Presidential candidate. Some of his friends speak of his deep interest in the welfare of the Filipinos and permit it to be inferred that he has postponed his decision concerning a place in the Supreme Court in order that he may continue to work for the relief of the islanders by promoting legislation and in other ways. Within a few months it will be necessary to fill a vacancy in the Supreme Court. This place the Secretary can have, but he does not intend to take it. It is well understood that he is Mr. Roosevelt's first choice for the Presidential nomination, but some think he will eventually turn to the Supreme Court.——Congressman John Sharp Williams, Democratic leader in the House, started for Europe last week. Just before he sailed he said:

"I think President Roosevelt will be forced to run again, and that he is planning to be forced. But the Democrats will win, and their candidate will be Mr. Bryan."

These remarks were reported to the President's secretary, Mr. Loeb, who said:

"The President meant exactly what he said on the night of his election, that he would not be a candidate again for the office. That statement is irrevocable."

In reports from Washington it is asserted that the President permits his friends to know that he desires to be a Senator from New York after the expiration of his present term. It has been unofficially announced at Oyster Bay that he will neither exert influence nor express preferences with respect to the present political situation in that State. Some time ago it was understood that his sympathies were with Governor Higgins and those who opposed ex-Governor Odell, chairman of the Republican State Committee. Last week, Senator Platt and ex-Governor Odell joined hands, and this alliance is said to be hostile to Governor Higgins and (so far as New York is concerned) to the President. Mr. Platt and Mr. Odell for some time had not been friends. It is said that the Senator was greatly displeased because the President would not honor his recommendations as to the appointment of a judge and a district attorney in the city of New York, and that for this reason the alliance with Mr. Odell was sought.

Mr. Hearst's Application Denied

Mr. Hearst is making an aggressive campaign in New York for the regular Democratic nomination for Governor. It is understood that if he fails to get it he will be the candidate of an independent party. After the Court of Appeals had denied Mr. Hearst's application for an opening of the ballot boxes and a recount of the ballots cast in the election which made Mr. McClellan mayor of New York city, he sought to procure a recount by legislation. The bill was defeated, mainly upon the ground that he had a remedy in *quo warranto* proceedings to test the Mayor's title to the office. Application was then made to Attorney-General Mayer for

permission to institute an action for such a test. Power to grant or withhold permission is vested in this officer. On Saturday last the Attorney-General denied the application, the gist of his reasons being that if all the claims made in affidavits as to miscounting and fraud should be allowed, only 666 votes would be affected, and McClellan would still have a plurality of 2,143. Mr. Hearst and his friends attack with much indignation this decision, which prevents any further contest. They assert that the four boxes which were opened showed errors or frauds which pointed to a total (in all the boxes) clearly sufficient to defeat McClellan; and that the submitted claims (affecting only 666 votes) were only specimens, as the actual miscounts or frauds believed by them to have been committed at hundreds of polling places could not be measured by the applicant so long as the boxes remained closed. Some politicians think that the denial of the application will assist Mr. Hearst in his campaign for the higher office.

Mr. Bryan on Silver and Corporations

Mr. Bryan has been reading, in London, the comments of American newspapers upon his recent utterances. These comments suggested to him some remarks which he gave to the press on the 12th. He noticed, he said, that he was now described by some as conservative. He had always been a conservative. "If they mean that I have changed my position on any public question or moderated my opposition to corporate aggrandizement, they have a surprise waiting for them. I am more radical than I was in 1896, and I have nothing to withdraw on economic questions which have been under discussion."

"The only question we discussed in 1896 upon which there has been any apparent change is the silver question, and that has not been a change in the advocates of bimetallism but in the conditions.

"We contended for more money and urged the free coinage of silver as the only means then in sight of obtaining it. The increased production of gold has brought in part the benefit we expected to secure from the restoration of silver. The per capita volume of money in the United States is almost fifty per cent greater now than it was in 1896, and the benefits brought by this increase have not only vindicated the quantitative theory of money but have proved the benefits of the larger amount of money. No advocate of the gold standard can claim the triumph of his logic.

"I believe in bimetallism, and I believe that the restoration of silver would bring still further prosperity, besides restoring par in exchange between gold and silver using countries; but I recognize, as do all other bimetallists whom I have met abroad, that the unexpected and unprecedented increase in gold production has for the present removed the silver question as an issue."

We should apply to other questions now forging to the front, he continued, "the same principles we applied to the money question," in conformity with the doctrine of equal rights for all and special privileges for none. "On the new questions many will act with us who were against us on the money question":

"Our efforts should be to distinguish between those corporations which are legitimate and those aggregations of wealth which are organized for purposes of public plunder, and appeal for support to those only who are willing to have the Government protect each person in the enjoyment of his own earnings."

Speaking of the return of old political friends or the addition of new ones, he said the party would not require tickets of admission. The Bible plan, which admits the eleventh hour comer to a place in the vineyard and to share the reward with those who began earlier, was sound politics, "provided the new recruit comes to work, and not to interfere with the other laborers." But experience must have weight in the selection of an overseer, and workers who come late will, if honest, be too modest to assume an attitude of superiority over those who toiled during the earlier hours.——In a published letter, Richard Croker, formerly of New York, says he hopes he shall live to see Mr. Bryan President. "I have no doubt," he adds, "but he was robbed of both elections by the Trusts."

The Pursuit of Rebaters

Having been found guilty of paying rebates to Schwarzschild & Sulzberger, the packers, on shipments from Kansas City, the Chicago and Alton Railroad Company was fined $40,000 last week by Judge Landis. John N. Faithorn, formerly vice-president of the company, and Frederick A. Wann, formerly freight agent, were each fined $10,000.——In New Mexico, Judge

Mills imposed a fine of $15,000 upon the Santa Fé Railroad Company, and one of like amount upon the Colorado Fuel & Iron Company, for violation of the rebate law.——Nothing has been accomplished by the inquiry before a Grand Jury in Cleveland concerning rebates alleged to have been paid to the Standard Oil Company. It is said that no evidence of oil shipments on the Lake Shore from that city was found. Owing to the practice of rebilling, the offences, if there were any, did not fall under the jurisdiction of the court for the Cleveland district. Some criticism of the Grand Jury has been published. The Jury Commissioner is the president of two financial institutions said to be controlled by the Standard Oil Company, and his brother-in-law was a member of the jury. The inquiry will be continued before a Grand Jury in Chicago. A Grand Jury at Jamestown, N. Y., is hearing testimony concerning unlawful concessions said to have been made to the Standard on traffic between Olean and Rochester. ——The Sheriff of Hancock County, Ohio, holds a warrant for the arrest of John D. Rockefeller, issued by Judge Banker, of Findlay, and says he will arrest Mr. Rockefeller whenever the latter enters the State. The charge is violation of the Anti-Trust law.——An investigation will be begun at once by the Interstate Commerce Commission, under the La Follette resolution, concerning the dealings of railway companies in the West with grain elevator companies doing business along their lines. It is alleged that the buying of grain has been monopolized by the alliance of the railways with a few favored elevator companies, competition having been suppressed and the owners of independent elevators driven out of business. For example, it is asserted that substantially the entire business on the St. Paul road is held by the Armour Elevator Company.

Prosecution of Ice Trusts

In several cities the local combinations of ice dealers engage the attention of prosecutors. Two companies controlling nearly all the supply in Washington, together with four of their leading officers, were indicted last week for violation of the Anti-Trust law. In Philadelphia, where thirteen ice dealers have been arrested and are awaiting trial, a warrant has been issued for Henry W. Bahrenberg, of New Jersey, president of the Mountain Ice Company, which is said to be associated with the American Ice Company in controlling substantially the entire Eastern supply of natural ice. The New York Board of Aldermen has unanimously adopted a resolution requesting District-Attorney Jerome to examine the books of the local ice companies for evidence to warrant the prosecution of them. He replies that he has no authority to do this, pointing out that power to make such an inquiry is conferred by the State's Anti-Trust law upon the Attorney-General of the State. He suggests that the Attorney-General be asked to take action, saying that if the inquiry shall disclose the needed evidence it will then be his duty to prosecute—a duty which he will perform "with great pleasure." In Brooklyn, 150 retail dealers, many of whom have been driven out of business by the combination's high prices, have raised a large fund to be used in making artificial ice for their business. The Attorney-General of Arkansas has sued three ice companies doing business at Little Rock, and asks penalties (under the State's Anti-Trust law) amounting to $500,000. He has also sued a firm of packers and ice dealers, whose domicile is in New Jersey, demanding $1,915,000 and costs. The same officer has undertaken to enforce the Anti-Trust law against the Waters-Pierce Oil Company (which is controlled by the Standard), asking damages in $2,000,000 and a forfeiture of the company's right to do business in Arkansas.

The Philippine Islands

Late reports from Manila say that the cholera epidemic is declining. Less than twenty new cases are found daily in the city. The death rate is about 75 per cent. Vaccine prepared at the Government laboratory is distributed without cost. It is believed to be effective. The disease has attacked none of the many natives who have been vac-

cinated. P. A. Galvin, one of the few Americans who have died of cholera, was in the civil service. Owing to an increase of his salary, a few weeks ago, he sent to St. Louis for his wife and two children. They sailed on the transport "Thomas," which had not arrived at Manila on the 10th, the day of his death. ——The safe arrival of the dry dock "Dewey" at Olongapo, near Manila, on the 10th, marked the successful completion of the greatest towing feat ever undertaken in ocean navigation. It was on December 29th that the drydock started from the Virginia Capes, towed by the colliers "Caesar" and "Glacier," with the "Brutus" near at hand, and the ocean going tug "Potomac" leading the way. The dock's displacement is 11,000 tons; the voyage, *via* Suez, was about 12,000 miles. Several times the dock broke away from the colliers, but was always captured easily. Hereafter all the battleships and armored cruisers of the Asiatic fleet may be docked and repaired in American waters.——In answer to an application from Hawaii, the Philippine Commission has decided to permit the employment of Filipinos under contract, for a term of three or five years, as laborers on the Hawaiian sugar plantations.

Hostilities in Central America

The invasion of Guatemala by revolutionists from Salvador and Honduras has caused war between Guatemala and both of these adjoining countries. At first, Guatemala complained because the revolutionists had been permitted to use Salvador as a base. It was proposed that with the aid of our Government the controversy should be settled by arbitration. Señor Pacus was commissioned by Guatemala as a special envoy to represent his Government's claims at Washington, but at the very beginning of his journey war broke out near the boundary. On the 12th a battle was fought at Jicaro, in Guatemala, five miles from the line, and Gen. Tomas Regalado, Commander-in-Chief of Salvador's army, and formerly President of the Republic, was killed. Martial law was then proclaimed in Guatemala, and all males over 21 years of age were called to arms. Some say that this first collision with Salvador's troops was due to Regalado's personal inclination rather than to Salvador's hostility. Regalado was successful in war against Guatemala fourteen years ago. It is also reported, however, that the attempt of General Barillas and his revolutionists to overthrow the Government of President Cabrera in Guatemala has had the support of both Salvador and Honduras. It was asserted on the 14th that Honduras, which had placed a large force on the border, ostensibly to preserve the peace, had declared war against Guatemala. This was denied by President Bonilla, who said that Guatemala's army had, without warning, invaded Honduras and been driven back. Even the official reports are sharply in conflict, each side charging the other with invasion. On the night of the 14th, Salvador's army attacked the Guatemalan forces at Platanar and was victorious, Guatemala's killed and wounded numbering 2,000. The good offices of our Government were promptly offered, in conjunction with those of Mexico, to the contending republics, and friendly pressure was applied to secure peace. This offer was accepted on the 15th by Guatemala and Salvador. Preparations were made for a meeting of Peace Commissioners or arbitrators on board the United States cruiser "Marblehead," which had come up from Panama.——In Brazil, the insurrection in the Province of Matto Grosso appears to have become quite formidable. The Governor has been killed by the insurgents, with the help of the Vice-Governor, a revolutionist, who now rules in his place. It is reported that General Riberio, with 40,000 men, has been sent to meet the revolutionists, and that 4,000 men have been slain in recent engagements.——Reports from Mexico say that a powerful revolutionary society has been organized there in the guise of a labor union, and that an uprising has been planned for September 16th. This society is said to be hostile to Americans, demanding that they be excluded from participation in Mexican industries. Many Americans have been warned and some have left the country. The recent riots at the Cananea copper mines are said to have been a premature exhibition of the society's hostility.

The Armor Plate Contract

When the bids for 7,328 tons of armor plate for two new battleships were opened at Washington, last week, it was found that those of the Carnegie and the Bethlehem Steel Companies were much higher than that of the Midvale Steel Company. Nearly $3,000,000 was involved, and the bids per ton were as follows: Bethlehem, $381; Carnegie, $370; Midvale, $345. For years the armor bids of the first two companies were the same and there was much talk in Congress about "the Armor Trust." Then the Midvale began to compete and prices came down. Last year the Midvale's bid was lowest, but it got only one-third of the contract, because of doubt as to its ability to supply a larger quantity without delay. Its ability appears to be admitted now, but appeals were made last week to Secretary Bonaparte by the two other companies for a share of the new contract, they offering to reduce their prices to the level of the Midvale bid. They were successful. The Midvale gets half the contract, and each of the other companies one-quarter. Secretary Bonaparte explains this action in a long statement. The two older companies would have been obliged to close their armor plants, and their skilled workmen would have been scattered, if they had received no part of the contract. The Government is not allowed to manufacture armor and is forbidden to buy it abroad, and the Secretary says it would be against public policy and the best interests of the naval service to place the Government in such a position that it would be obliged to trust to a single armor plant to supply its needs.

The Dreyfus Case

Now that the Dreyfus case is closed by the decision of the Court of Cassation, the supreme court of France, declaring Alfred Dreyfus innocent of the crime of treason, it may be of interest to give a brief and plain history of it, for the affair has been so involved, and the facts have come to light in such a fragmentary manner during the last twelve years that few had had the patience to follow it with sufficient attention to get a connected idea of the whole. The primary cause of this conspicuous miscarriage of justice was the mutual jealousy and irrepressible conflict between the army, aristocratic, reactionary and intolerant, and the republican government, growing continually more radical and anti-military. The motive power of the persecution of Dreyfus was the widely prevalent anti-Semitic hatred among the French people. The origin of the affair was the elaborate system of mutual spying for obtaining military secrets in practice all over Europe. The woman who cleaned out the office of the German Embassy, at Paris, was hired by the French Government to bring to the Intelligence Office of the War Department all the torn and half-burned scraps of paper she found in the waste-paper baskets of the German military attaché. Among these was discovered a memorandum (*bordereau*) containing a list of items of information about the new arms and manual of the French army, which the writer offered to furnish to the Germans. The officers of the French Intelligence Office, in running over the list of officers who could have had access to this information hit upon the name of Alfred Dreyfus, who, in spite of the prejudice against him, had gained a position on the General Staff thru his high standing in his studies and examinations. He was then 35 years old, married to the daughter of a rich diamond merchant, and had a private income of over $5,000 from his father's spinning factory, in Alsace, run by his brothers, who, when that province was lost to France, became German subjects. As a Jew and an Alsatian he was distrusted and disliked by his brother officers, and his unpopularity was increased by his cold and haughty manner and air of self-sufficiency and reserve. The handwriting of the *bordereau* resembled that of Dreyfus, and some of the experts to whom it was submitted, notably Bertillon, the inventor of a well-known system of measuring criminals, was very emphatic and persistent in declaring it the same. Dreyfus was arrested and tried before a secret court martial. The evidence was so flimsy that the court was about to acquit Dreyfus when the Minister of War, General Mercier, realizing that the Ministry would fall a victim to the fury of the public if a conviction was

not secured, appeared before the court with a secret portfolio (*dossier*) of incriminating documents, which Dreyfus and his counsel were not allowed to see or hear. He read, among others, a torn note from the German waste basket relating to stolen plans of the fortress of Nice, and saying, "that rascal D. (*ce canaille* D.) becomes daily more exacting." General Mercier read it "Dreyfus," altho only the initial appeared, and that is now known to refer to a man named Dubois. Upon the weight of his authority the court found Dreyfus guilty of treason, and before the troops on the Champ de Mars he was publicly degraded. Captain Dreyfus maintained his usual impassive demeanor, but when the insignia of rank were ripped from his uniform and his sword was broken, he shouted: "I am innocent. *Vive la France! Vive l'Armée.*" He was condemned to solitary confinement for life and sent to French Guiana with the official notification that he was "a hardened malefactor, quite unworthy of pity." He was confined to a cabin and stockade on a small malarious island, known as Devil's Island, forbidden to read the papers or to write to his friends. He could talk to no one and was sometimes shackled to his bed at night. He came near dying from the fever and almost lost the power of speech and his mental faculties from solitude and anxiety. In the meantime Madame Dreyfus and his brother devoted themselves to procuring evidence justifying a revision of the verdict, but with little success, on account of the opposition of the Government. But the new head of the Intelligence Office, Colonel Picquart, was an honest man, and, as the leakage of military information did not cease with the imprisonment of Dreyfus, he began to suspect that he had been unjustly condemned. Among the contents of the waste-paper baskets brought to him he found a city telegraph card (*le petit bleu*) torn into fifty pieces, addressed to Major Esterhazy, a dissolute and impoverished officer, descended from a noble Hungarian family. Every effort was made to suppress Picquart, who was reprimanded by his superior officers for being meddlesome and sent to Tunis on a military mission. But very opportunely a *fac-simile* of the *bordereau* was published in a Paris daily, from a photograph secretly taken by one of the handwriting experts to whom it had been submitted, and several persons recognized it as the writing of Esterhazy. A secret and farcical court martial was held and acquitted Esterhazy. Then Zola published his famous letter in *L'Aurore,* edited by Clémenceau, now Minister of the Interior, containing a series of direct personal accusations (each beginning with the words *j'accuse*) against the officers who had conspired against Dreyfus. The boldness and substantial truth of the attack, tho mostly guesswork of genius, forced the Government to take action. Zola was tried for libel and condemned to a year's imprisonment and a fine of $6,600. He fled to England to avoid sentence. Picquart was discharged from the army and condemned to solitary imprisonment for questioning the actions of his superiors. But thru the Zola trial another of the documents of the secret *dossier* was brought to light. This was proved to be a forgery and Colonel Henry, of the General Staff, who had fabricated it as evidence against Dreyfus, confessed the crime when charged with it, and the next day com-

Dreyfus declaiming his innocence when his sword was broken on the Champ de Mars. From a statuette by Caccia.

mitted suicide in prison. Major Esterhazy escaped to England, and there confessed that he had written the *bordereau,* but said he had done it by orders of his superior officers as part of their system of counter espionage. Public excitement had now been roused to fever heat, and the fate of the Republic seemed trembling in the balance, but the attempted incitement of the army to a *coup d'état* failed, and the Chamber of Deputies authorized a revision by the Court of Cassation. The Court ordered a new court-martial to determine the absurd question, whether Dreyfus had furnished to a foreign Government the documents mentioned in the *bordereau,* now admittedly written by another man. Dreyfus was brought back from Devil's Island, and, in 1899, again tried by court-martial at Rennes. Here again the secret *dossier* was effectively utilized, and it had been enlarged by the addition of many new documents, mostly official forgeries, among them an alleged confession of Dreyfus, and a letter saying, "that D. has brought me many interesting things." On the basis of these and because they felt the honor of the army was at stake, the Court of Rennes brought in the peculiar verdict of "guilty with extenuating circumstances." The Government then offered a pardon to Dreyfus and he accepted it, much to the disgust of Maitre Labori, who had defended him, and had been shot for doing so.

The Vindication of Dreyfus

But the efforts of Dreyfus and his family and friends to secure his complete vindication did not cease, and at last the case was again brought before the Court of Cassation on the ground of the discovery of new facts. The court found that the initial D in the document produced at Rennes had been originally P, and had been altered by one of the official forgers; that the alleged confession of Dreyfus was false; that part of the *dossier* had been written while he was in prison; and that one of the documents in the *bordereau* could not have been in his possession. The court this time did not make the mistake of ordering a new trial by court martial, but declared that

"These facts are of a nature to establish the innocence of the accused and there is nothing which can be imputed to him as a crime or misdemeanor. The accusation against Dreyfus, whether based upon the handwriting or text of the *bordereau,* was completely unjustified and without reason. Moreover, Dreyfus having a large fortune, there was no motive for his committing such a crime. The Court therefore holds that as all the accusations fall to the ground, there is no necessity for a new trial, and, consequently, the judgment in condemnation is annulled as unwarranted by the evidence."

Dreyfus declared to the court that he would waive all claims to pecuniary damages, and a law was passed some years ago prohibiting any further legal proceedings growing out of the case, so no action can now be taken against those guilty of the judicial crime, but the Chamber of Deputies took prompt measures to repair the wrong done to the innocent men. By a vote of 474 to 42 the Chamber reinstated Dreyfus in the army with the rank he would have attained if he had remained in the service, that of major and chief of a squadron of artillery. He was also nominated for the Cross of the Legion of Honor. Picquart, who was condemned on forged evidence for his efforts in behalf of Dreyfus, was made a brigadier-general. It was voted that the body of Zola be buried in the Pantheon. In the course of the discussion, M. Pressensé, Socialist, demanded the removal of General Mercier and the other officers who had secured the condemnation of Dreyfus, and declared that they deserved branding with hot irons. At this Deputy Pugliesi-Conti shouted at the Ministers: "You are scoundrels for permitting these insults to officers." Under-Secretary of State Sarraut thereupon sprang at him and struck him in the face. A duel was fought the next day, in which M. Sarraut was thrust thru the lungs by the sword of his opponent. Ministers Clémenceau and Thomson acted as his seconds.

Reduction of the British Army

The Secretary for War, Richard Burdon Haldane, made on July 12th the announcement of the plans for the reorganization of the British army, as proposed by the Government. The War Secretary said that there was

no member of the House who did not regard the state of the national forces as highly unsatisfactory from the point of view of both cost and organization. He believed that it would be possible to reduce the expense and at the same time increase the efficiency of the army. The mandate of the people was emphatic and unmistakable, that the Government should do something to lighten the crushing burden due to armaments resting upon the people of Europe. He proposed to reduce the regular forces by about twenty thousand men. Seven battalions of infantry abroad and three battalions at home, including two battalions of Guards, would be abolished. There would be no reduction in cavalry. Fifty-two battalions would be maintained in India at the present time, but the colonies would hereafter have twenty-five, instead of thirty-two battalions. It is proposed to maintain the war establishment at the rate of five guns for every one thousand bayonets and sabres, keeping eighty-one of the ninety-nine batteries on a four-gun instead of a six-gun basis, and eighteen on a two-gun basis. To reinforce the regular army in case of emergencies the Government proposes to organize an expeditionary force of 150,000 men, trained for service, and ready to be called out at any time. Sixty-three of the batteries of artillery would be assigned to this expeditionary force. For reserves it is proposed to organize the volunteers, and to arouse the military spirit in the young men of the country, by inciting them to local emulation. The volunteers will be under the management of county organizations to be formed partly of nominated and partly of elected members, and under the presidency of the Lord Lieutenants of the counties.

The Russian Navy

In accordance with the Russian law that requires that any naval officer who surrenders a Russian ship must suffer death, the officers who surrendered the gunboat "Bedovy" in the Sea of Japan were put on trial for cowardice. After the defeat of the Russian fleet which Admiral Rojestvensky had so successfully conducted from Kronstadt to Japan, a distance of 17,000 miles, the wounded admiral took refuge in the "Bedovy," which was overhauled the next day by the Japanese warship "Sazanami," and promptly hoisted a white flag with the signal "We are damaged." Four of the officers on board the gunboat pled not guilty before the court-martial, but Admiral Rojestvensky assumed all the responsibility, saying that the other officers had surrendered only out of regard for his safety. The Admiral declared himself ready to submit to the full penalty of the law. It was proved, however, by the surgeons that at the time he was out of his head from his wounds and incapable of giving any orders. A lieutenant testified that Captain de Colongue, chief of the Admiral's staff, had ordered him to get a sheet from below to use in case a Japanese ship was met, but when he brought it on deck Captain Colamatieff indignantly threw it into the sea. The court found Admiral Rojestvensky innocent and the four officers guilty. They were sentenced to be shot, but in view of the extenuating circumstances the Emperor is requested to commute the sentence to dismissal from the service.——The announcement in the House of Commons that the British fleet would visit Kronstadt during the Baltic maneuvers raised a storm of protest on both sides, and it has been abandoned. Many people in England objected to such a manifestation of friendliness to a Government that was responsible for the massacres of Bialystok, and on the other hand the members of the Duma felt that it would strengthen the hands of the Government at this crisis. The Russian Government also was unwilling to receive an official visit, because the navy is crippled, and a mutiny might break out in the midst of the festivities, which would be embarrassing to both visitors and hosts.——A second, and this time a successful, attempt to assassinate Vice-Admiral Chuknin, commander of the Black Sea fleet at Sevastopol, has been made. Last February a woman who had gained access to his residence fired four shots at him. She was at once killed by the orderlies in the courtyard. This time he was shot by a sailor, rumored to have been a woman in disguise, who was concealed by the shrubbery of his summer residence, and who escaped. Admiral

Political Decay—An Interpretation

BY EDWARD A. ROSS, Ph. D.

Professor of Sociology in the University of Nebraska.

PATRONAGE, jobbery and like maladies springing from the greed of public servants have long been endemic in American government. They reached their culmination in the political assessments and the larcenous rings (Tweed, Whisky, Indian, Credit Mobilier, Star Route) that disgraced the seventies. This old-fashioned corruption in the form of postal frauds, land frauds, filtration jobs and public works steals is still with us, but it is no longer typical. Latterly, new cupidities, originating quite outside of politics, bent less on the harvesting of spoils or the looting of the public treasury than on the commercial exploitation of the people, have bred such surpassing forms of rottenness that today every nostril detects an odor of unmistakable significance. No man in his senses can deny that at many points in this country government has reached an advanced stage of decomposition.

How can we account for this condition?

The causes must be *adequate,* and hence it is idle to blame particular policies, such as tariff, pensions or imperialism. The "ignorant foreign-born voter" is not the cause, for the corrupt machine is often manned by the native born and operated successfully in strongly American communities. In view of the proven venality of rural voters and rural legislators in certain commonwealths, let us exonerate the "wicked cities." Rich men as such have not bedevilled our politics, for the corrosive at work is not ambition, but avarice; not the fortune made, but the fortune making. The hypothesis of a moral sag in the American people due to "godless" schools or decline of religious belief is belied by the indubitable improvement in domestic life, in consideration for the weak, in the care of the unfortunate and in the treatment of animals.

Our political decay has two roots. One is the corrupting pressure of an increasing mass of wealth dependent upon the favor or forbearance of government. Mighty as is the State, its instruments bend or break when they encounter stubborn material. The greater the stake in an action of government, the greater the strain to which they will be subjected. Officials or legislators will be warped further from the line of duty if the destination of ten talents turns on their decision than if only one talent is in jeopardy. For wealth is a store of unspecialized social force. The instinct of self-preservation endows it with organs and senses. Menace it and it grows teeth and claws. A million dollars at bay somehow finds feet to run for it, ears to eavesdrop for it, brains to plan for it, tongues to wheedle for it. Ten millions cornered contrives to enroll among its supple servants crippled veterans, ex-statesmen, heavy constitutional lawyers, influential editors, even after-dinner orators.

With the greater magnitude of the interest affected by the action of government, its methods of corruption become more refined, insidious and menacing. If ten thousand dollars of annual traction profits hinge on the vote of a city council there will be attempts to bribe. Let a hundred thousand tremble in the balance and the councilmen will be besieged by an organized lobby, plied with well-timed editorials, fake petitions and dummy deputations, tempted by mysterious shakings of the "plum tree" and launchings of "driftwood." Make the stake a million and the political fabric will be rocked to its base. Months, even years, in advance the interest will be laying the wires to control that fateful vote. It will mount to the head waters of political power, divert the current to its private ditch and conduct that power wherever it has use for it. In party finance the bag will yield to the barrel, the barrel will give place to the tank. On its behalf primaries will be packed, conventions manipulated, bolters disciplined, newspapers chloroformed, election judges bought, police "instructed," repeaters colonized and decent citizens terrorized. Decay spreading from the

organs of political power to the channels will finally, in the cash bribery of voters at the polls, infect the ultimate cells.

It matters little who are the persons interested. Christian or heathen, native or alien, rich or poor, their Interest behaves much the same, for the corporate form unsouls the management of wealth. Take one gas company formed by saints and another formed by sinners. The directors of the two corporations will be more alike than the stockholders, the officers still more alike, the "counsel" and "legislative agents" will scarcely differ by a shade and the party bosses they support will be equally bad. So little does the character of the stockholders count that one may follow the formula: *The force devoted to wresting government from the people will correspond to the magnitude of the pecuniary interest at stake.*

Now, in a brief lifetime the points of contact between government and private interests have multiplied amazingly. In the days of well water, candles, sorghum and flat boats there were no water, oil, gas, sugar or railroad interests to confound politics. When the people ate food of their own raising there was no pure food problem. Government did not regulate handicraft as it regulates the modern factory. Thirty years ago the razorback gas and horse car companies let politics alone, but the coming of water, gas and the trolley, coupled with urban growth, gave them the lard of monopoly gains to defend and made the public service corporations the arch corruptors of city government. Before the consolidations the railroads held the knife of competition at one another's throat, but today the shipper looks to government for protection. Telegraph, express, meat packing, oil refining, anthracite coal mining, feeling less and less the automatic restraint of competition, ripened visibly toward public regulation. Life insurance, the Jonah's gourd among businesses, already exudes "slush" for the debauching of legislatures. Moreover, a new business has arisen — the manufacture and sale of securities — and so "finance" strives to mold corporation law and to control courts, commissions and officials.

We now know just who are sapping popular governments. The assault on the cities comes chiefly from the vice caterers and the privileged corporations. Saloon, bagnio and race track want a "wide-open" town. Restrict them and they go after political power. The water, gas, street car, telephone and electric lighting companies want long time grants of the public streets on easy terms, a free hand as to prices and fares and exemption of their franchises from taxation. Considering that the franchises in Greater New York are worth upward of $400,000,000 and that the stake in the ten-year traction contest in Chicago was $75,000,000 worth of franchises the financial power on the side of bad government is Titanic. Ranged about these big interests are the banks intriguing for deposit of city funds, rookery landlords dreading the health officers, business men intent on grabbing an alley or a water-front, and a horde of rich tax dodgers.

The commonwealths are beleagured by a formidable array. The railroads want to avert rate regulation and to own the State board of equalization. The gas and street railway companies want ripper legislation, the authorization of fifty-year franchises and immunity from taxation of franchises or limitation of stock watering. Manufacturers want the unrestricted use of child labor. Mining companies dread short-hour legislation. Publishers want their text books foisted upon the schools. The baking-powder trust wants rival powders outlawed. The oil trust want to turn safety inspection against the independents. A horde of harpies have the knife out for pure food bills. Brewers, distillers, elevator combines, pet banks, rotten insurance companies—all have a motive for undermining government by the people.

The pressure upon Congress is like the strain that crushes twelve-inch props in the galleries of a mine. Here are the railroads clamoring for fat mail pay, for right of way across Indian reservations, for right of cutting ties on the public lands. Collectively they have the club lifted against rate regulation, safety appliance provisions, the outlawing of rebates and the Panama Canal. The express companies are concerned in head-

ing off the parcels post, the Western Union in killing postal telegraph schemes. The shipping interests are after subsidies. The trusts want to be let alone. Fraudulent foods and drugs are alert to throttle pure food bills. As if this were not enough our tariff policy rashly invites all the over-protected interests to come in on behalf of their schedules and line up among the public enemies.

To gain these anti-social ends the special interests must, of course, guard their means of control, and hence they are adamant against the merit system, direct primary, referendum, ballot reform, anti-pass regulation, corrupt practices acts and like "fads" tending to strengthen the people. The simple imagine this opposition to be inspired by personal convictions or grounded on profound theories of government; the wise see only the versatile servant of the interests earning his fee.

The transformation of popular government into government by special interests presents four stages: First, ordinary "political" legislators or officials are influenced or bought for specific purposes. This is the era of lobby and bribe. Second, scenting "easy money" vultures work their way into public life, form a "combine" and sell legislation for what they can get. This is the age of boodle. Third, financed by the Interests the party machines send up "safe" men who will vote as they are told on bills affecting corporations. These Hessians, however, improve their opportunities to make something for themselves, and their unbridled greed brings scandal on the *régime*. This is the epoch of blackmail and petty graft. Fourth, the Interests falling gradually into a system cease to be customers of the bosses. They own them and are able to grow their own legislators. This brings into politics a more respectable type that scorns miscellaneous graft and takes his reward in business favors or professional connections. The big Interests will even sacrifice the vice Interests by clapping "the lid" on saloon and dive and race track. This decent conduct of public affairs, free from the odium of grafting and blackmail, is known as "good government," and is the fine flower of perfected commercial oligarchy.

The multiplying points of contact between private businesses and government are not the sole cause of the blight on our politics. Switzerland, too, has had these behemoths to curb, yet no stench exhales from the little republic of the Alps.

Granting it is natural for special interests to seek to control government, why is it they can enroll among their janizaries so much talent, character and respectability? Why do so many successful lawyers, big journalists, eloquent orators and prosperous pillars of society serve for hire? Why will so many men "be good" and "go along" lest their business be "hurt"? Martyrs and heroes will, of course, always be rare. But why will so many of light and leading suffer emasculation rather than consent to be well to do instead of rich? to do a middling business instead of a big business? to live in a house instead of a mansion? Why is manhood so cheap, defiance so rare? The secret is that the more conspicuous portion of the American people are caught in a powerful current of Mammonism. Men lust after the dollar, will sacrifice more manhood and self-respect in order to get it. It is so coveted not for the things it buys, but for the social consideration it brings. We all crave an acknowledged success, and money has become the diploma of success. It is this because we have come to measure human worth by the cash standard; we grade one another by possessions. Not lust of luxury, but this false estimate is at the bottom of our money madness. This false estimate in turn has arisen out of the scattering of fabulous wealth by parvenus. The sudden fortunes in the period just after the war overwhelmed the tone giving society in Northern cities with a torrent of vulgar display which the old ideals could not withstand.

Such is the diagnosis. Relief will come, has in some quarters already come. Certainly the pendulum is swinging away from Mammonism and a civic revival is in progress. It would be well to consider, however, if our politics can regain the normal channel until the mass of private wealth hanging on the favor or forbearance of government is sensibly diminished.

LINCOLN, NEB.

The Interparliamentary Union

BY HAYNE DAVIS

[During the coming week the Interparliamentary Union will hold an extraordinary session at London to pass upon the report of the Commission appointed at the Brussels Session to consider a plan for peace proposed by the American delegates. This will unquestionably be the most memorable session in the history of the Union. It is therefore a fitting time to give our readers an insight into the origin and growth of this history-making organization.—EDITOR.]

IN 1885 there was no Interparliamentary Union. Up to that time members of even two National Parliaments had never assembled together. In that year a man named William Randal Cremer took a seat in the British House of Commons. He was then the only English labor unionist that ever had entered this Parliament. When only twenty-five years of age he went thru a nine months' industrial war, as one of the labor leaders. This war was one of the severest ever waged in England, and it extended to business which required the services of 100,000 working men. In England four persons, on the average, depend on every workman, so that about half a million people were affected by this lockout. Its fires burned into the mind of Mr. Cremer this idea—"Warfare between those who are dependent on each other is madness." He came out of that struggle with the light of this idea brightly burning in his mind, and ever since then it has been the guiding light of all his actions. As soon as he took his seat in Parliament, this light began to shine on the political problems in front of him. As a member of Parliament, he was compelled to pass judgment on questions which concerned the people of other nations as well as of Great Britain, and he found the Government perpetually engaged in preparation for war and periodically engaged in war itself. He saw that the right way out of this wrong condition was to introduce the principle of arbitration into international affairs. His clear discernment of this fact constituted him the inevitable instrument for its realization. Within two years after his entry into Parliament, every member of the House of Commons and many members of the House of Lords were compellled to choose between signing and refusing to sign the following document, which Mr. Cremer drafted, before he disclosed to a single person the thought which had come to him, when reflecting, alone and devoutly, upon the best way of abolishing this plague of war from the affairs of men:

"To the President and Congress of the United States:

"The undersigned members of the British Parliament learn with the utmost satisfaction that various proposals have been introduced into Congress, urging the Government of the United States to take the necessary steps for concluding with Great Britain a treaty, which shall stipulate that any differences or disputes which cannot be adjusted by diplomatic agency shall be referred to arbitration. Should such a proposal happily emanate from the Congress of the United States, our best influence shall be used to ensure its acceptance by the Government of Great Britain. The conclusion of such a treaty would be a splendid example to those nations who are wasting their resources in war-provoking institutions, and might induce other Governments to join the peaceful compact."

Mr. Cremer told me some interesting incidents connected with securing signatures to this document. John Bright was then in Parliament, and when Mr. Cremer presented the memorial to him, Mr. Bright inquired whether there was any precedent for the memorializing of the members of one Parliament by the members of another. That is always an Englishman's first question. Immediately Mr. Cremer made a reply which has flashed out from Englishmen in so many crises and changed the course of history. "There is no precedent, but this is the thing to do. So we will make a precedent."

Mr. Bright then scrutinized the memorial sentence by sentence, and finally ended by saying: "I could not have drawn it better myself," as he affixed his signature.

Mr. Cremer appeared at Washington on October 31st, 1887, armed with this document, subscribed by 234 members of Parliament, and asked for an interview with Grover Cleveland, who was then President of the United States. Andrew Carnegie arranged the interview, and Mr. Cleveland was gracious to the British delegation which accompanied Mr. Cremer and to the idea on whose behalf they had come. Tho a treaty of arbitration has not yet been concluded between England and the United States, a much more important result has come from this visit to America than was then in the thought of these bold brothers from the British Isles.

Mr. Cremer became aware, while in the United States, that England's course toward Ireland had created a sentiment in this country which has to be reckoned with. During his visit a hostile demonstration took place in Philadelphia, which assumed the proportions of 1,000 men marching thru the streets decrying his mission.

He was deeply impressed by another fact—the wealth of gratitude and good will in America toward France. He told me that these facts contributed to his going from Washington to Paris with a view to inducing French statesmen to attempt what he had failed to accomplish.

Undaunted by apparent failure, this indomitable arbitrator appeared at Paris the first of August, 1888, and on the 6th of that month a small company of statesmen were assembled at the home of Jules Gaillard to meet him. He was taken to call upon the Minister of Foreign Affairs, and succeeded in inspiring the Frenchmen to act as leaders in what he declared was a great and world-wide movement, and which was sure to succeed.

The result was a circular letter addressed to the 234 signers of the American memorial, and to members of the French Parliament, requesting their presence at a joint conference of British and French Parliamentarians to discuss a treaty of arbitration between France, England and the United States. This circular was signed by Frederic Passy, Jules Gaillard, Gaillard, Lolande, Barodet, Jules Siegfried, Montant, Sobatier, Lyonnais, Yves Guyot, Ferdinand Faure *et als.*

Exactly one year from the day on which Mr. Cremer was received by Grover Cleveland, he and eight other members of the British Parliament were received at the Grand Hotel, Paris, by 25 members of the French Parliament, to discuss a treaty of arbitration between England, France and the United States.

As the memorial to the United States Congress was the first of its kind, so this meeting created a still more important

The Hungarian Parliament Building.

HOTEL CONTINENTAL, AT PARIS, TAKEN FROM THE TUILLERIES GARDENS.

The Interparliamentary Union was born in this Hotel in 1889. The Commission appointed by this Union to pass on the question of creating an International Congress held its fourth session here on November 19th, 1905, when the report in favor of an International Congress was signed. This Hotel has been the scene of innumerable events of the greatest historic importance.

precedent. The 34 members of two parliaments assembled on that memorable occasion decided that a second meeting should be called for a day during the Paris Exposition (1889) and that members of other Parliaments should be invited to attend.

On the day appointed, June 29th, about 100 members of various Parliaments appeared, not only France and England being represented, but also Belgium, Hungary, Italy, Norway and the United States. On the 30th day of June, 1889, Mr. Justin R. Whiting, of St. Clair, Mich., the sole representative from the United States Congress at this memorable gathering, was presiding over its deliberations, when the following resolution was unanimously adopted, on motion of Marquis Pandolfi, of Italy:

"Further Interparliamentary Reunions shall take place each year in one of the cities of the various countries represented at the Conference. The next meeting shall be at London."

Several of the men who took part in this memorable conference are still active in the public affairs of England and France.

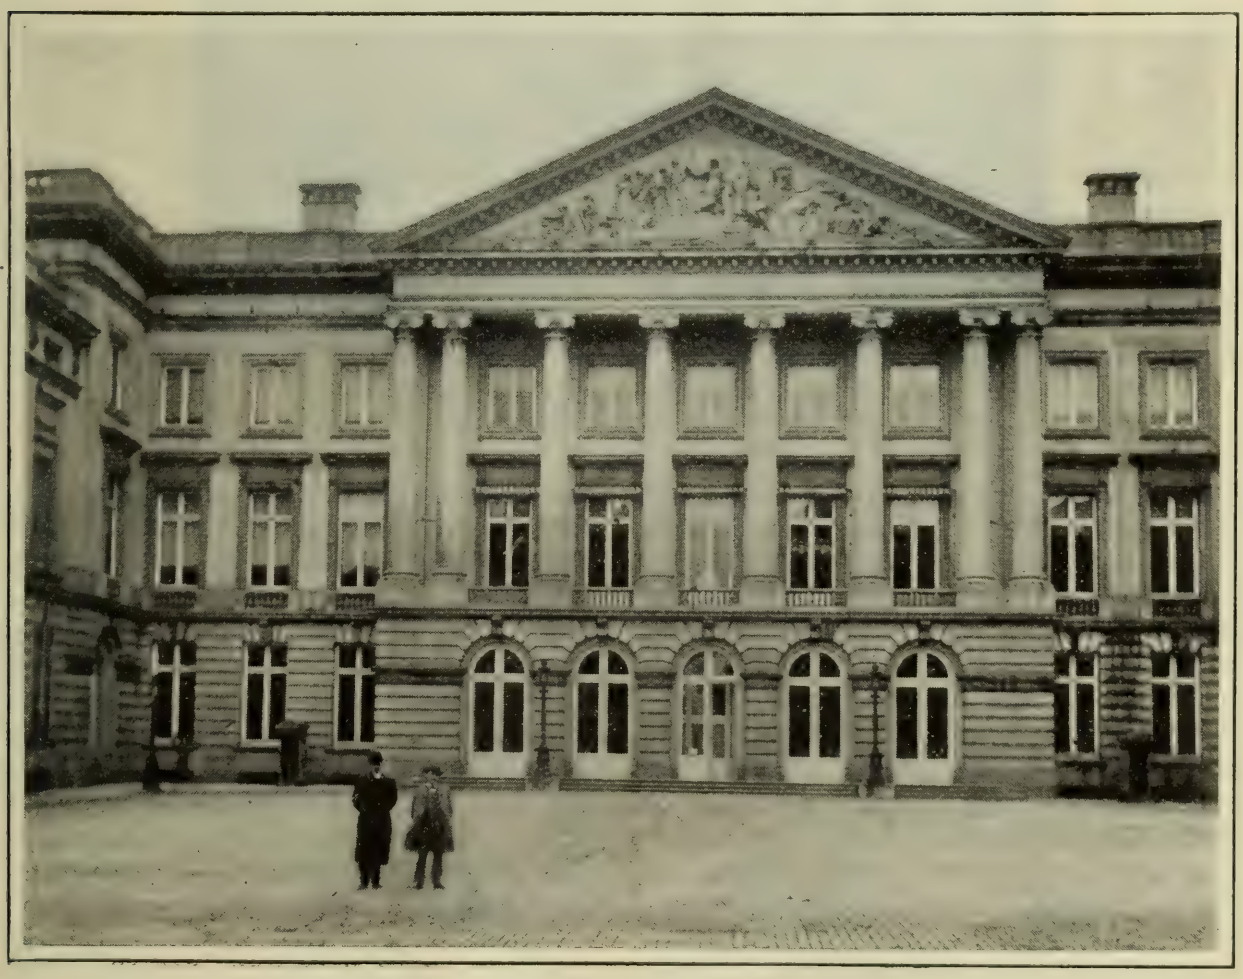
Mr. Stanhope, Mr. Cremer, Mr. Burt and several more of the nine Englishmen are in Parliament. Jules Simon, who concluded peace between France and Germany, was among the French contingent. So were Frederic Passy and M. Bourgeois, the new Minister for Foreign Affairs at Paris.

The resolution to hold periodical conferences was the vital act of that assembly. It gave birth to the Interparliamentary Union; that Union has begotten the Hague Court as its first born, and is to bring forth an International Congress as its second child.

The Continental Hotel, where this Union was born, has been the scene of many memorable events. Situated opposite the Tuilleries and between the Louvre and the Champs Elysees, it has been a witness to those things which have made France notorious the world over. Mr. Cremer is responsible for the selection of this famous hotel as the birth-

place for the Union, as well as for the creation of the Union itself.

After it had been decided to hold the conference at Paris, a committee of arrangements was named. Mr. Cremer was on this committee for England, and was active in the discharge of all his duties. He saw that invitations were received by all the 234 members of Parliament, in whose name he had made his move on Washington. He showed me some of the responses. Even then men with the prophetic sense could see that this was no mere dream of an enthusiast. One of the declinations read as follows:



"HAWARDEN, October 5, 1888.

"DEAR MR. CREMER—I have several political engagements at the end of this month, before Parliament meets, and I much regret that it is out of my power to be present at the interesting, and what may be historic, gathering in Paris, on the 31st inst.

"Yours faithfully,

"HERBERT GLADSTONE."

Having attended to all the duties assigned to him, Mr. Cremer was prompted to run over to Paris some days in advance and make sure that everything was in readiness. He was conducted by the French members of the committee to an out of the way and dingy hall as the place of meeting, and was assured that it was the only place that could be secured in Paris at the appointed time. He had been during all his life a plain man, from the common people, whose expenses were then and still are paid by his constituency, and nothing is further from him than useless display. But he instinctively felt that the place was unworthy of the event, and he told his friends on the committee that he would find a more suitable place. He looked far and wide for a place that seemed suitable, and ended by engaging the famous "Salle des Fêtes" of the Continental Hotel, the choice conference hall of all Paris. He did not let the question of money stand in the way. That seemed to him the proper place for the Confer-

PALAIS DE LA NATION, AT BRUSSELS.

The Belgian Parliament House, where the Interparliamentary Union heard the proposal for a Permanent International Parliament on August 29th, 1905. Made by Hon. Richard Bartholdt, of the United States Congress. Hayne Davis and William R. Cremer in the foreground.

ence, so there was where it should take place. He occupied himself day and night sending out notices to those who had signified their intention to be present, advising them of the change of place.

As soon as the delegates from the British Parliament arrived, he explained to them what he had done and why; instantly they subscribed the money necessary to meet the requirements of the situation.

Mr. Cremer has watched this child of his grow, in stature and in favor with the people, and in power. He has attended all of its twelve sessions, held at the principal capitals of Europe, and also the one which was held at St. Louis in 1904. He showed me mementos of its sessions at Paris, Rome, Budapest, Vienna, Brussels, The Hague, Christiania, Berne, etc. At each of these cities he observed new faces, representing new Parliaments, in such numbers and with such rapidity, that what was once merely an idea in his mind is now a great organized power, containing over 2,000 members, and fast becoming an irresistible force in world politics. It is really an unofficial International House of Representatives. A seat in it can be secured only by inducing the people of your vicinity to elect you to their national Parliament.

By the advent of the United States into the council chambers of this Union the future plan of its campaign has been formulated. And this plan is treaties of arbitration, which grant jurisdiction to The Hague Court over such questions as are included in the treaties, and an International Congress to supply this court with the principles of law, which it must apply to the controversies which come before it.

During the thirteenth session, held at Brussels August 28th-30th, 1905, I had the honor of several long talks with Mr. Cremer about the birth and growth of the Union, and these were supplemented by other talks at London. He is heartily in favor of the turn given to the American proposition, by his friend and constant companion at all the Interparliamentary conferences, Sir Philip Stanhope, now Lord Weardale. It was Sir Philip who first suggested perpetuating the Second Hague Conference as a means of arriving at the end proposed by Mr. Bartholdt; and it was Count Apponyi and Marquis Pandolfi who advanced the idea of transforming the Interparliamentary Union into an official instead of an unofficial International House of Representatives.

The Interior of the House of Commons.
From Bourne's "History of Europe." Longmans.

Americans will be quick to see why Europe took this way of accepting the plan put forward by Mr. Bartholdt. The monarchs of Europe still have a tight grip on international affairs, the Parlia-

ments being limited for the most part to the internal affairs of their particular country. The monarch will name the delegates to the conferences at The Hague when these conferences become periodic and automatic, instead of spasmodic as now.

The Parliaments want to acquire more voice in international matters, and when law-making becomes a part of international politics the representatives of the people will be entitled to more voice in these matters than they now enjoy.

For us in America, where the Executive is elected by the people, it is of comparatively small moment whether the Executive appoints all the delegates to the sessions of the International Congress or whether some are chosen by the Congress. But if our Executive was hereditarily chosen it would be quite a different proposition.

This plan of transforming the Interparliamentary Union into an official body aims at carrying the *elected* branches of even monarchical governments into the international law-making body which is now being formed.

It is an interesting phase of the question, and the outcome will doubtless depend upon the strength of this demand for a place in the International Congress by the people's representatives. That there will soon be an International Congress can no longer be doubted. The question now is what shall be its structure and powers. The existence and power of the Interparliamentary Union and the imperative need of humanity will force this matter to an early issue. And unless I read erroneously the signs of these times the Parliamentary idea is sovereign in the political world. Those monarchs who bow to this sovereign can remain, for a season at least, upon their ancestral thrones. Those who dare to make a stand against the Parliamentary idea will dig their own graves, and must sooner or later descend into them.

When Mr. Cremer conceived this Interparliamentary Union he was regarded by many as under a delusion, and he had to endure much ridicule, meeting even with insult at the hands of a member of the Committee on Foreign Relations at Washington. That was less than twenty years ago.

Now the world is applauding the men who stand for early realization of things which are beyond Mr. Cremer's dream of ten years ago.

In the light of these facts, it would not require unusual courage to declare one's faith in the early constitution of an International Congress having jurisdiction, in a clearly defined sphere, and co-operating with the half-hundred national Parliaments, as harmoniously as the United States Congress co-operates with the fifty State Legislatures on which it reposes. The Interparliamentary Union is the body which will see that this is done and without any great delay.

New York City.

Goldielocks

BY EDMUND KEMPER BROADUS

Whence came it, this glow of your hair,
Goldielocks, Goldielocks?
Do you wish me the secret to share,
Goldielocks, Goldielocks?
With the buttercups yellow the work was begun;
Then the butterfly messengers sped to the sun;
For the sun is an alchemist rare,
Goldielocks, Goldielocks.

Then the sun, when he found you so fair,
Goldielocks, Goldielocks,
With his yellow sunbeams filled the air,
Goldielocks, Goldielocks;
And the little sun fairies who dance in the beams
And dip their paint-brushes in the rainbow of dreams,
Surely they must have tinted your hair,
Goldielocks, Goldielocks.

Vermilion, S. Dak.

When Bryan Left Us

BY DAY ALLEN WILLEY

"SOCIALISM? Why, I could only write about the American phase of it, for I don't know anything of European socialism except what I have read in the newspapers. I don't even know if the movement abroad could be called socialism as we define it."

This was the answer William J. Bryan gave me the night before he left the United States for his "world tour," as it has been called. The scene of the interview was in the magnificent lobby of the St. Francis Hotel in San Francisco, a few months later to be left a blackened ruin by the fire which swept over the city. Happening to be in San Francisco gathering the material for a series of magazine articles, it occurred to me to ask Mr. Bryan if he would be willing to define his ideas of socialism for a periodical to which I contributed.

The author of the "Cross of Gold and the Crown of Thorns" had been invited to speak to the students of the University of California at Berkeley that evening, so it was nearly midnight when he entered the hotel. Lounging around on the richly upholstered divans and chairs were little knots of humanity—women in evening toilet chattering with men in Tuxedos or full dress. The aroma of the Havana mingled with the odor of the perfume and toilet powder. The hum of conversation was occasionally broken by laughter. The scene was similar to those nightly enacted in the *hotels de luxe* of the greater American cities, which cater to the needs and fancies of lovers of luxury — who have the money to pay for it.

There was little formality about the entrance of the man from Nebraska. Accompanied only by Mrs. Bryan and three or four newspaper reporters, he bustled in without waiting for the attendant to open the door. His wife immediately went to her room, heedless of the polite stares of the feminine contingent which followed her. Settling himself in a stuffed leather chair beside a writing table he smiled at the newspaper men gathered about, with the remark: "Boys, I'm rather tired and it's late. You know I sail tomorrow and I have considerable to do. No, I did not make any notes of my speech. It was just a little talk to the university students — not of enough consequence to print. Reception at the Press Club? Well, I may be able to run in a little while. Of course I would like to meet you all, for you see I am a writer now like the rest of you." Then Mr. Bryan glanced at my card and shook hands, with the smile that has made him famous.

A night six years before came into mind. A man was speaking on a Baltimore street corner in the rain, to such a mass of people that only a few of those who had crowded in front of the stand could hear his voice. But when they cheered the rest followed. His clothes hung loosely on the spare figure of the orator. The pallor of his features and the dark lines about the eyes intensified their color. Full of nervous energy, as shown by the frequent and forceful gestures, the man was a human dynamo —but a dynamo that was rapidly wearing away. The present Bryan at first glance looked like a country lawyer or parson with a comfortable income. He has gained considerably in flesh. His face has filled out. The bald spot on his head has not decreased in size, but his hair has not lightened in color. As he lounged in the big chair he impressed one with the idea that he is not worrying over the world as much as a half-dozen years ago.

But when he began talking on the topic which is probably most on his mind his face lighted up. It was plainly evident he had lost none of his old-time vim and animation. "No," he continued, "I know so little about what they call socialism on the other side that one reason I am going abroad is to study it."

Then I again referred to the article.

"I cannot promise definitely. I would not want to say anything except about the American movement, because, you

see, I only know of this at first hand. After I look into it in Japan, Russia and Germany, for instance, any views I have had about these countries might be changed materially. Now about how long an article would you want?"

I told him.

"Well, I think it could be discussed in that length."

Then I asked him how much he would be willing to accept as remuneration.

"The —— magazine offered me (naming a certain sum) for an article on another subject of the same length. If this is satisfactory to you it will be to me. You see I expect to do considerable literary work. I have made an agreement to write a series of letters, also articles, for other publications, and if I am paid by one editor it is only fair to him that I should be paid by all. If this were merely a sight-seeing trip and I had the time I would be willing to give my views without compensation."

I put in this conversation, since it so clearly reveals the frankness of the man and his ideas of business.

Then the talk turned upon his tour. "I have long wanted an opportunity to see other countries, especially the life and the ways the people have of dealing with the various economic and social problems. By going as a writer, like yourself for instance, I can obtain the information I want much better than if I were in some official capacity. Then I am also free to compliment or criticise. If I were a member of Congress, for example, there might be subjects which I could not write about without being discourteous to the people to whom they pertained; besides, I might get our Government into trouble."

"You are fond of literary work."

"Very much so, but only within the last few years have I had a chance to indulge in it. Editing the *Commoner* has been very congenial. Of course I am glad it has been successful, but this is due to the fact that the paper has filled a demand for such a publication, not to personal effort. It is intended to be just what the name implies. By the way, I shall have to ask that my article on socialism be published in the *Commoner* after it appears in the ——. This is an arrangement I have made with all other editors. As yet I have not written much for magazines, but if I had the time and my matter was acceptable I should like the work in preference to that of the daily journalist."

A little over twenty years ago—to be exact, in 1884—the young lawyer married the Illinois girl with whom he had fallen in love when he was in college and she in the seminary at Jackson, Ill. After marriage Mrs. Bryan studied law to keep informed on her husband's practice, but it is not so well known that much of her spare time, when he was a part of the official life in Washington, was spent in the study of financial problems—with the view of assisting him. Twenty years ago she was not only her husband's principal confidante, but one of his advisers. With the years have come the duties of motherhood, but while she has reared her children and been mistress of the household, today Mrs. Bryan is as much his companion and adviser as when she first entered his life. His reply to a question about the routine to be followed on the tour revealed their close association. "I could not plan out so much on this trip if it were not for Mrs. Bryan. I had thought of taking a stenographer, but she requested me not to do so. She has been my secretary so much that she preferred to do it on this tour. We carry a typewriter in one of the trunks. I shall have it in my stateroom, and soon as we leave the harbor I shall begin some work, finishing it first in long hand, when Mrs. Bryan will look it over and copy it on the typewriter."

"Does she act as critic?"

"Always when I have any doubt about a paragraph I get her views. She is an excellent critic. If it were not for her assistance I could not begin to accomplish what I do."

So with the aid of his wife Mr. Bryan planned the tour from which he is returning. Outside of the ordinary passports from the State Department he had no other credentials than the standing of an American citizen. When he arrived in San Francisco there was no delegation of citizens waiting to receive him save the reporters, and the only function in his honor during his stay in the city was the Press Club reception to which I have

alluded. At the hotel he was merely an object of curiosity to the few guests who knew who he was. When he embarked on the steamship there were no bouquets, brass bands or processions—not a half-dozen people gathered to bid him fair voyage. Just like thousands of other plain Americans, the Bryans traveled thru the Orient seeing not only what is revealed to the ordinary tourist, but acquiring information which may one day be given to the world in a book or series of books. They made their way from place to place quietly and unostentatiously. They stopped at hotels which were comfortable, but economical. They had no private cars, steam yachts or automobiles. Many was the night when this mutual benefit society of two members held a "business session" until after midnight comparing notes of the day, the husband throwing off page after page of manuscript to be copied by Mrs. Bryan's agile fingers on the typewriter.

But, as the cablegrams have told, the Old World for some reason has come to the conclusion that Mr. Bryan is a "great American," as a European journalist puts it. The people of Japan and China rivaled the Filipinos in the warmth of their reception to him, and later he has had a sort of triumphal passage thru Europe from the Chamber of the Duma to the House of Parliament.

When he left America he was practically ignored. His reception on his return promises to be one of the greatest which the American people have ever given a man in any station of life.

Why?

BALTIMORE, MD.

Of Love

Songs From a Drama

BY CURTIS HIDDEN PAGE

Phyllis speaks, sighing:

WHAT love is, who can tell?....
Life's aim?—or a folly of youth?
A madness? a fairy spell?
A dream?—or the only truth?

Corydon sings, cheerily:

'Tis to joy in the steep of the hill,
'Tis to feel why the sky is blue!
'Tis never to wish but to will,
And whatever you will, to do!
To be happy with all or naught,
To glory in star and flower,
To gather space in a thought
And eternity in an hour.

Colin, apart with Marion, sings softly:

What love is?—'Tis to live!
That's all their lore can show....

Marion, softly singing:

But the best truth's yet to give—
It's just: you must love, to know.

Phyllis:

Where love lives, who can tell?—
In the eyes? the hair? the mouth?
In the heart?—or doth he dwell
In the Spring, in the winds, in the South?

Corydon:

Seek him, you'll never find—
But wait, and he'll come to you.
Yet never a bond can bind
This false one to be true.
The bond of a word he'll break,
The bond of a vow forswear;
Yet leave him free, and he'll take
Himself in a self-made snare.

Marion:

Where love lives?—search not so
To find the flighty elf.
Just love....and then you'll know
Love lives within love's self.

Phyllis:

Whence love is—who can tell?—
A satyr, of sinful birth,
Or the sweetest saint that fell
From Heaven, to bless the earth?

Corydon:

He is born of the mating of birds,
Of the bridals of air and fire,
Of the myriad marriage words
That guerdon the world's desire.
He is born of the sun's glad light
And the moon's sweet, subtle ray;
Of the crimson kiss of night
At its twilight tryst with day;

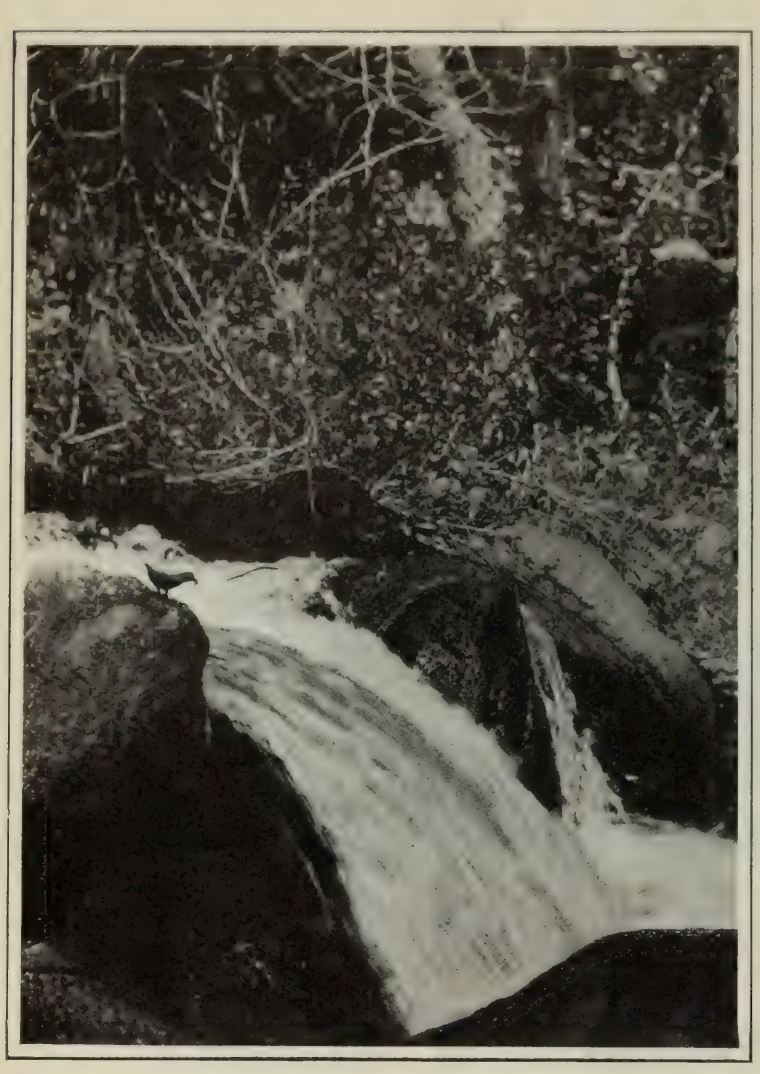
Colin, softly singing:

Or the gentler, trembling kiss
That the night receives from morn.

Marion, speaking, very softly:

But the truest truth is this,
Love is of loving born.

COLUMBIA UNIVERSITY, NEW YORK CITY.



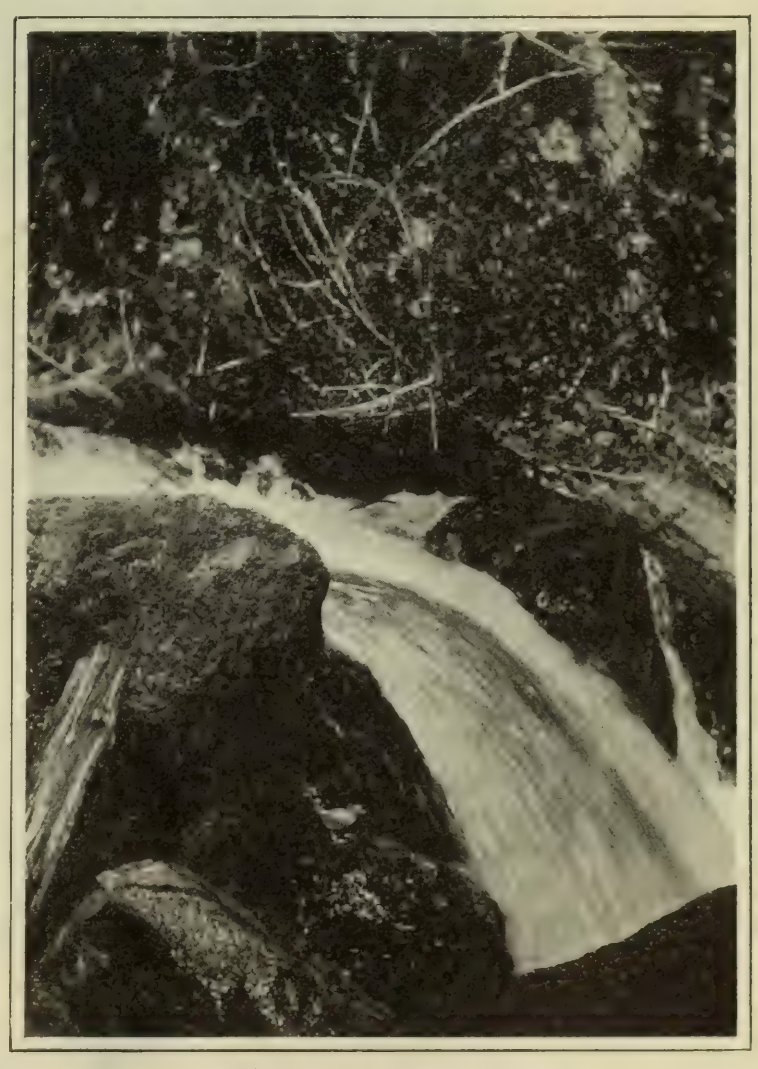
The Descent Into the Kern Canyon.

The Water-Ouzel at Home

BY WILLIAM FREDERIC BADE

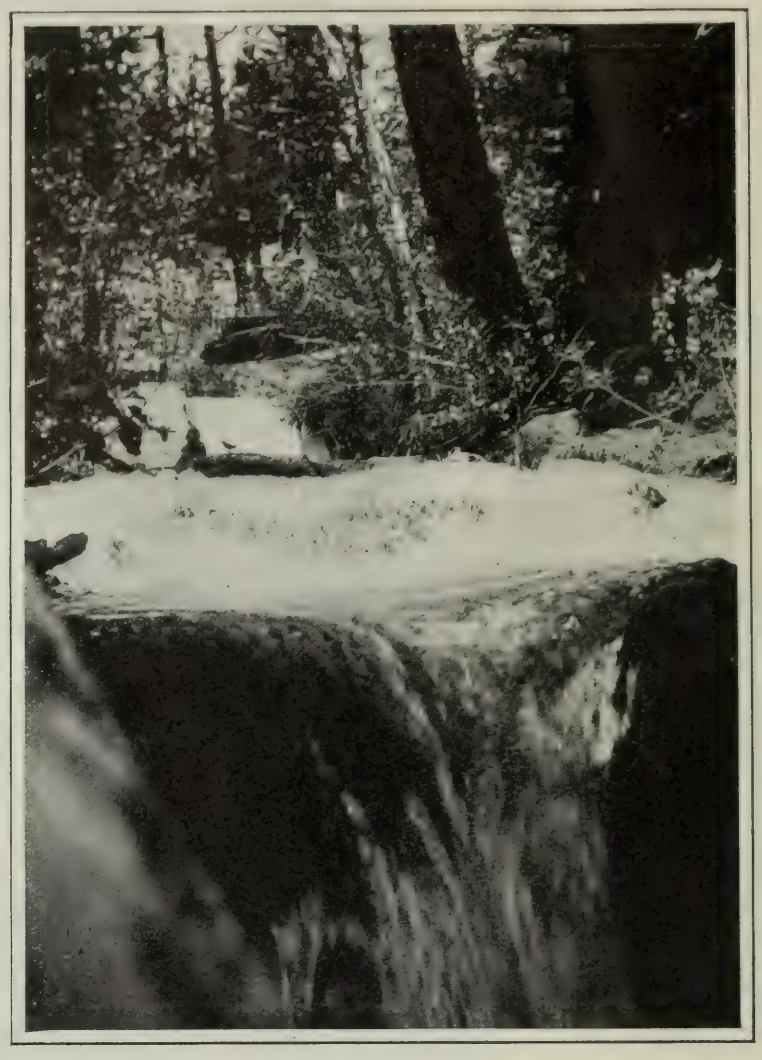
[Professor Bade has spent much time in mountaineering and nature study, and we are sure this brief article on one of the rarest and most interesting of American birds will please our readers.—EDITOR.]

FOR days we had been urging our patient burros over snowy mountain passes into the heart of the southern Sierra Nevada. Our destination was the Kern River Canyon, where, far from civilization, we at last pitched our camp under the sugar pines, somewhat more than six thousand feet above the Pacific. One dawning July morning I was worming my way thru blooming ceanothus along the banks of Coyote Creek, eager to cast the fly on a few foam-flecked pools near its junction with the Kern. Fed by the melting snows of the Great Divide, every morning found the creek at its fullest, for then it was carrying past our camp the increment of the previous day's thaw. A keen ear could easily detect in the thunder of its falls a fuller crescendo, and the water leaped from the escarpments with greater abandon. True to her name, the water-ouzel (*Cinclus Mexicanus*) was there in her favorite environment of alder, pines and flying spray. John Muir's classic study of this unique bird had long made me desirous of seeing it in its native haunts. My efforts to beguile the excessively wary trout that morning made me an object of much suspicion to a pair of "Dippers," who seemed to claim exclusive hunting rights on that part of the creek. Evidently they had never seen a man do a thing so insane as to whip a stream with a make-believe fly at the end of a long string. Was he fishing for ouzels? Did he expect their nestlings to bite on that fly? Their behavior made it apparent that a brood must be hidden away behind one of the many cascades. It required but little observation to locate the nest — a



With a May-fly in His Bill.

moss-built affair sunk in the floor of a niche behind a heavy sheet of falling water. The site had been cleverly selected. No increase of volume in the stream could endanger the nest, for the pool had enough fall to spill all the water above a certain level. The diaphanous liquid curtain effectually screened it from observation and protected it from bird enemies. Few carnivorous birds would venture to seek their prey behind a waterfall. The ready accessibility of this nesting site for purposes of observation at once suggested to me the possibility of photographing the birds as they came and went in pursuance of their family duties. Their excessive shyness was the only obstacle. To overcome this I continued to fish for two days near their particular cascades, pretending not to see them; and yet it was only the occasional unwary trout that found his way into my creel. My interest for the time was more ornithological than piscatorial. The ruse succeeded, for the ouzels decided that I was harmlessly interested in my own business, insane tho it was, and began to go about theirs with confidence. This probation period afforded opportunity for the study of their habits and manners. The water-ouzel is indeed a bobbing, bowing, winking compound of many avian charms. His nickname "dipper" is the result of an attempt to describe him by one of his most obvious traits. One is tempted to speculate in what far-off period of time this "humming bird of blooming waters" may have acquired the bowing and scraping habit which one is accustomed to think the peculiar accomplishment of the snipe family and a few other birds. The possession of a nictitating membrane, evidence of long and intimate acquaintance with the water, gives the bird an air of winking at the observer.



In his search after food he often lights in midstream on some rock over which the water dashes at intervals. Not infrequently I saw him swept off into a churning pool. But his short wings enabled him to rise from the water with ease. Sometimes he complacently swam to the nearest bank and waded out. He can use his wings as oars or as fins, so that it makes little difference to him whether he swims upon or under the surface. Several pairs of these birds had set up housekeeping in more inaccessible places under some of the higher falls. As with short and rapid wing stroke they darted in and out among the flying spume and spray, often directly thru the swaying sheet of water, they seemed the very embodiment of the spirit of the waterfall. The two sprites which I had under particular observation were quite generous in showing off their varied accomplishments. They swam, dived, waded, sang; they pirouetted from rock

to rock, slipped into the current by intention or accident, flickered in the sunlight, and washed their slate-colored plumage in the crystal water of the falls. Four hungry mouths kept them extremely busy. Every few minutes they appeared with their bills full of insects that live in and beside the water. In fact, a young water-ouzel seems to be quite as bottomless as a baby robin. Both continue the begging habit as a fine art long after they ought to be finding their own grub. Several young ouzels which I observed near the falls of Volcano Creek seemed the most accomplished avian beggars I have ever seen. Not only their voices, but every sprouting pinfeather seemed to be saying "Give a poor beggar something to eat!"

Not the least interesting and commendable feature of a water-ouzel's family life is the fact that husband and wife expect to assume equal shares of the family burdens. How they apportion their duties during the period of incubation I was not able to observe. But both minister with equal assiduity to the needs of the fledglings. What is more important, they seem to hold each other to the performance of this duty under difficult circumstances. The following incident took place at the time when I was preparing to photograph the birds at close range: I had concealed my camera within six feet of a place where they were accustomed to perch before entering the niche behind the cascade. Such close approach again excited suspicion and alarm. For considerably more than an hour they refused to carry food to their nestlings. Then the female began to reconnoiter. Seeing that I was apparently only whipping her home pool, as I had lashed many another pool in the neighborhood, she decied to risk a visit to her nest with a load of tidbits. The distribution must have been made with unseemly haste, for she immediately appeared again thru her doorway of spray. She was, however, in no haste to leave the neighborhood, but lit on a boulder a few feet away and warbled the equivalent of a "coast clear" to her lubberly husband, who was still nursing his suspicions on a distant rock in the stream. He would not come. His bill was full of May-flies. A second and third time she signaled, and now he very circumspectly approached the cascade that hid the nest, flitting hesitatingly from rock to rock until he was almost beside her. But suddenly his fears again overcame his courage, and he darted precipitately back to the place from which he had started. He was not going to risk his neck, not he! This churlish behavior seemed to rouse the ire of his spouse. Instantly she lit beside him, and running her bill several times vigorously into his fluffy plumage she took his catch of May-flies from him and carried them to the

He Likes to Stand on a Moss Cushion and Watch the Stream Glide By.

On a Distant Rock in the Stream.

hungry nestlings. Her example, no less than the little explosion of wifely indignation, seemed to recall him to a sense of his duty. My presence was soon ignored and he came and went as regularly as she. One of the accompanying photographs shows him with a May fly in his bill, ready to dart behind the fall. His whole attitude—the uptilt of the stubby tail, the poise of head and body—suggest something of the alertness that characterizes the water-ouzel at all times. The grace and swiftness of the mountain stream have passed into the bird's movements. The dash and music of the cataracts have sung themselves into his being. And there are moments, even in his busy life, when he likes to stand on a moss-cushion and watch the stream glide by. One cannot but deem it unfortunate that the English naturalist Swainson, seventy-nine years ago, succeeded in christening the ouzel with the species name *Mexicanus,* merely because he first encountered the bird in Mexico. A bird hatched in an oven—such is the form of the ouzel's nest—might with equal reason be called a biscuit. The cascaded mountain fastnesses of the Pacific Coast, thru all their long range from Alaska to the tropics, are his inalienable home. There his song will charm, his manners win the mountaineer who has the courage to fare into the wilds where the kingfisher giggles and the rainbow trout leaps the white rapids.

BERKELEY, CAL.

The Jargon of Low Literature

BY OWEN KILDARE

Author of "My Mamie Rose," Etc.

"SAY, cul, if youse bo't me for wot I feels like and't sold me on me looks, you'd be so broke ter pieces'd never get togedder agin. I feels like ready money, see, an' all dere is of it, but I looks like a block o' subway, 'cause I ain't blinked me peepers f'r two days an' nights, an' if youse was to shake me body I'd rattle like a bag o' pebbles."

Permit me to inform you that the above is not a figment of imagination nor a lingual specimen of the dialect of some foreign race, but is an exact excerpt from a realistic story of low life, taken from a magazine, which enjoys an enormous and, supposedly, intelligent circulation. It would be a waste of time to translate this and other freakish contortions of our mother language. Yet, the mother language, as really spoken by the slum people, is capable of improvement.

The sharpest difference exists between "slang" and the jargon put into the mouths of low life characters by contemporaneous writers. The former is admittedly forced and manufactured, while the other is supposed to be the everyday vernacular of the poor.

From time immemorial the Bowery has been cited as the birthplace of slang. In general, slang passes as the expression of a coarse witticism, and if you will note the complexion of the Bowery population you will scarcely deem it the parent of any sort of humor. The fifty thousand men who crowd the lodging-houses are, in the majority, not native New Yorkers, but, the disgraced sons and black sheep of respectable families, they come there from all parts of the country and the globe, with no heavier baggage than their home dialect. Of course, a lingual mosaic results therefrom, but not slang. The life of these men is precarious. Waking and dreaming theirs is the constant worry of how to obtain the absolute necessities of existence. This leaves very little time for anything else, and the manufacturing of slang requires time and a mind possessed of a happy-go-lucky philosophy.

To be sure, ten and fifteen years ago, when the Bowery was still the happy hunting ground of the festive gold-brick investor and the celebrating sailor, there was a certain element, which, besides attending to the visitor, had enough time and inclination to coin many phrases, which were the very essence of slang philosophy. Since then the Bowery has changed. While then men were *done*, now things are done on the Bowery, and the dives have been replaced by commercial and manufacturing concerns. And that sort of environment is not favorable to slang or its manufacturers.

When the *hard* times came to the Bowery, the gentlemen of sorts and leisure sought pastures new and found them in the Tenderloin. There, in close proximity to the "swells," their slang and type was more appreciated, and eventually presented on the stage. The city oozed slang, slang books, slang plays and slang poems were the literature of the day. In the course of time, recognized writers, aye, geniuses, took a hand at slang-making, and then it became a thing weird and unholy. Before the evolution of slang had far proceeded it had become as intelligible to the average Bowery loafer as it would have been to a professor of old Oxon.

One of the hits of last season was a vaudeville sketch, billed as a "Bowery Idyl" and praised by the critics as a "slang classic." Three hundred words were stenographically taken and read to a man who has not left the Bowery in over fifteen years. He listened to it with the expression of a cat hearing distant thunder, and his comment was: "What kind o' stuff is that? What are you doing, kidding me?"

Still, lovers of slang who come to the Bowery need not go away disappointed. A number of places make a specialty of keeping up the old bluff. Several "types"

are always on hand to offer you, as the "real thing," slang, heard by them the night before at the London or Miner's Bowery Theater.

The imagination of low life writers is proverbial and makes them see things invisible to ordinary eyes. Everything is grist that comes to the graft mills of the Bowery, and when apparently sane men will insist on discovering "types" in the most transparent frauds, the "types" will surely not disillusion them.

A certain saloon on the edge of Chinatown has long been the mecca of low-life writers. The approach of the genius is duly heralded and before the American Dickens in embryo has reached the premises, the "types" are already posed for him. Ordinary, harmless bums and tramps become ferocious, hulking bravos, with hats cocked daringly over their eyes, hands bored into pockets, shoulders hunched up to their ears and leering mouths, ejecting profanity and expectorations. Their speech becomes a rivalry in distortion, and the idiom, inspired by the moment, abounds in "hully gee," "slats," "peepers" and other terms of equally classic degree.

As a particularly interesting sign of the times it might be stated here that, while most of the low-life writers of the male gender have seen the error of their ways and have partly reformed, the field is now largely covered by those brilliant young women who, students, sociologists and romancers, have, besides their realism, the gentle gift of maudlin pathos, which makes out of every lazy loafer a veritable Bowery Villon.

The defective language of the poor is the result of the careless indifference which affects their entire existences. It is sound logic to assume that men who become careless in their appearance and sanitary condition will also become careless in their speech. This carelessness of speech does not deteriorate into witty slang, but shows itself in faulty grammar and enunciation. "Shall" and "will" are used most arbitrarily. Racial and national combines of dialects make "them" frequently become the substitute for "these" and "those," and from that it is only a step to the supplanting of the "th" by the dull "d."

The lavish use of negatives in one sentence is not only typical of the East Side and is also found West, North and South, but here the harsh intonation—a reflection of their life's tenor—makes it more grating and noticeable.

There is abundant proof that environment and association will improve or deteriorate one's speech. The environment of the East Side is responsible for its lingo. And just because the environment is degenerating we have no standard by which to judge the jargon presented to us by low-life writers. I have lived most of my life in this environment and have had opportunities in plenty to observe many deteriorations of speech. As for instance:

The son of eminently respectable parents landed *via* many devious and somewhat crooked paths in our ward. Something in the past had made him an outcast among his own kind, so he came to us, who are supposedly sufficiently wicked to receive all scoundrels with open arms. There was method in his madness. He knew that an ex-coachman of his family was now the owner of the most prosperous saloon in our ward, and this friend in need installed him as bartender.

The patronage of the place consisted chiefly of truck drivers and 'longshoremen. On his first appearance the new bartender was heard to say: "I beg pardon, but may I trouble you to repeat your order?" And it is not difficult to imagine the effect of this pretty speech on the customers, and I assure you your imagination will not exaggerate. He had convincing proof that his language must become adapted to the environment, and the force of circumstances made him within five months a linguistic specimen to delight the most realistic low-life writer.

A feature of underworld stories is the conspicuous absence of that uniformity in dialect which one finds in stories depicting life in other portions of the country. The written dialect of other territories—no matter whether East, South, North or West, and no matter by whom written—is full of certain staple words and phrases which have become veritable trademarks. The same uniformity seems to be impossible of accomplishment to low-life writers.

The East Side is no longer the camping and fighting ground of different races and nationalities. For over a decade it has been overwhelmingly and thoroly Jewish. There is something very distinct in the Jewish character and speech, and one would naturally expect a decided uniformity in the portrayal of this race. Yet a comparison of the writings of authors who have made this field their specialty will show all sorts of glaring discrepancies. A comparison of the stories of Myra Kelly and Bruno Lessing will corroborate this assertion. They do not only differ in idiom, but also in character drawing.

In the jargon which passes as the typical Bowery and East Side lingo of Celtic origin the discrepancies are, perhaps, even more glaring. The question "do you?" will be written "d'you?"; "do ye?" or "d'ye?" or "dee ye?"; "nothing" appears as "nothin'," "nawthing," nawthin'," "notting," "nossing." And other low-life expressions are equally variegating.

One cannot write about the jargon of low-life without referring to the subject of profanity. The stage, books and stories have dispensed with "dashes" to give profanity in all its convincing purity.

The term most frequently used is the equivalent of "to perdition" and "to Hades" of polite society. To my best recollection this term was first made famous in contemporaneous literature by the author of "Chimmie Fadden," a book which is not available at present. However, I think I am right in stating that the above torrid expression was interpreted by "Chimmie," the intrepid hero of many impossible adventures, as "wot tell."

It only needed this initiative to flood our low-life stories with this pointed invitation of removal to a warmer clime. But even in this instance uniformity seemed impossible, and it came to pass that magazines, by the staidness of which our grandfathers used to swear, indicated their new literality by "t'ell," "t'hell," "wot t'ell," "vot t'ell," "to 'ell," "hell," and so on.

There is a plausible reason for the discrepancies in low life lingo, but the above warm adage has no claim to it. It is never used excepting in the white heat of passion, and then it is uttered with distinctness and deliberation and rings out thrillingly: "To hell."

The plausible reason for most of the discrepancies lies in the individual stage of observation taken by the writer. After choosing his setting, the writer will fasten upon a picturesque or interesting character. The antecedents of the character are not considered. The fact that he was found in the slums is sufficient guarantee that he is a full-fledged representative of the slum population. I know of instances where men, scarcely acclimatized to the slums, but picturesquely dilapidated, were greedily chosen for literary purposes. These characters are aware of the writer's intention and help it along most enthusiastically. And of such make are the realistic pictures of the netherworld. But, if not true, the imagination of slum *littérateurs* makes these pictures entertaining.

Not long ago, while engaged in making my usual rounds among my old neighbors and dressed conveniently in a sweater, it was my good fortune to cross the path of a jungle-hunting lady writer. She had her setting, all she needed was the interesting character—when she met me. My shock was agreeably minimized by her assurance that a "good deal of intelligence was still traceable in my features and that, with a little effort, I would surely rise above my surroundings."

According to promise, the marked copy of a Sunday magazine supplement reached me in due time and gave me the opportunity to study myself in print. Evidently there was a difference of opinion between the artist and the writer of the story, for even a microscopic examination failed to disclose in the portrait (?) the "still traceable intelligence." But this defect was offset by the speech put into my mouth. Let me quote a fragment:

> "Say, Polly, if I sees that cove putting up his snoot to them ruby kissers o' your'n again, I'll soak him in the slats till his teeth falls out like a bunch o' beans."

And thus, according to the lady writer, do I utter my tender sentiments. On the other hand, it is a subject for serious speculation what would happen to me were I to address my real "best" in that energetic manner.

At another time, in search of one of my *protégés,* I found him in the back room of a low saloon, being studied by a lady writer. It was not a pleasant sight to see this supposedly refined young woman in confab with the filthy, bleary-eyed "has-been." She, however, was not in the least repelled by his appearance or the slimy atmosphere of the dive. Art above all! The man was a college graduate, and, before his downfall, had been the leading lawyer of his town; still he was "wise" to the game and played the desired *rôle* fairly well. The concentration of the lady writer prevented her from noting the many little evidences of former breeding, which he could not always repress, and she went away with a completed picture of a real tenement man.

I overheard part of the conversation and was exceedingly surprised when I found the ex-counselor express himself as follows, in print: "Look here, sis! I —youse ain't next tuh what I'm tinkin', see? I'm a wise blokie, but youse made a hit wit me, an' that's no kid. Did you ever tink of cuttin' this an' mebbe hookin' up wit a good guy? Do I mean it? Aw, soitenly, soitenly. I'm a hustler, kid, I am, an' when them ponies is runnin' I kin make me finipth a day on de track. I ain't no dead one."

Enough specimens have been cited to show that low life lingo is without standard and manufactured *ad libitum.* Let us hope that, some day, these dialectic *raconteurs* will awaken to the fact that, besides lingual distortions, rich veins are still undiscovered in the low life, rich enough to yield epics, yes, a literature of its very own.

The carelessness of low life writers is also seen in the frequent use of misleading terms, which, by popular endorsement, sometimes become parts of our general language. Josiah Flynt, in his underworld stories, persisted in applying the term "big gun" only to thieves. He is mistaken. To the men of the slums anybody who rises to the top in his calling is a "big gun," may he be lawyer, politician, judge, physician, capitalist, or, also, notorious crook.

Samuel Hopkins Adams, in a story in the March number of *McClure's,* speaks of "peter players." Even the slum children—more's the pity—will tell you that there are "peter men," but no one has ever heard of "peter players." He quotes "rope" as low-life term for a night's lodging. In over thirty-five years on the Bowery I have never heard that word in that connection. As additional specimens from this story let me quote two sentences. "Well, whadda yeh think of that?" being glaringly faulty in making only the first part idiomatic and leaving "think of that" absolutely unchanged. A perfect gem is this toast: "To t'e best ship in t'e navy, t'e 'Texas'."

And these things are inflicted on patient readers in spite of the fact that the Bowery and the East Side are not in Central Africa, but can be reached from any part of New York City for the small fare of five cents.

It is claimed that low-life writers first do their stories in purest English and then throw a handful of apostrophes at the manuscript, but this I will not believe, even if some pages are seemingly conclusive proof. The trouble is we have no low-life language. The conditions of tenement people are subject to many changes and do not permit the formation of a typical dialect. The "has-beens" are forever deteriorating in speech, while I know many families in which the progressive education and broadening offered to the children by the settlements is reflected in the improved manner and language of the parents.

The slums have long been a tempting field for writers, but it is to be regretted that so many are striving to show their originality only in exaggerations of language. Far more interesting than their form of expression is the inner life of the humble. In telling the absolute truth about the lesser people the highest and most noble realism will be accomplished. And that will go toward the making of real literature and the betterment of humanity, and will be worthier work and bring greater glory than the invention of jargons, never spoken, never existing—and scarcely ever read.

New York City.

My Summer-Boarders

BY ONE WHO HAS HAD THEM

(Photographs by the "First Two Boarders.")

A YEAR'S experience with city pleasure seekers on a New England farm leads to the conviction that the genus "Boarders" can be made happy there, provided they are well cared for, and in turn can be made to serve as mortgage-raisers or to furnish forth those luxuries and amenities of life, the necessary money for which it is extremely difficult to wring from the rocky hills which make the beauty of our ancient village country.

Given an old-fashioned farmhouse situated in a lovely valley, near enough to town and railroad for comfort, the undertaking of opening it as a quiet summer home for city people seemed perfectly practicable. The house was large enough for the needs of a good-sized family, having been built by the father of one of the old-time families of six sons and six daughters, in the good days when posterity was esteemed of greater account than vacations.

As a sample may truthfully represent the whole, the comparatively small number of people coming to this farm to spend their holidays showed those varieties of temperament and purpose which may be found in varying degree among crowds.

As children had not gone out of fashion in my estimation, I determined to make my farm a place where their wants and welfare were to be considered. I have surprised the eyeglasses off the nose of more than one old maid by telling her that I attended to the needs of the children first and then what time was left would be devoted to the grown people. The attitude of one grumbling bachelor who said: "All children ought to be kept in barrels until they are twelve years old" seems to be generally held; altho most people are too considerate of the feelings of young mothers to express such sentiments. Nothing, except it may be a barrel, is so good for growing children as farm life, and as there were no attractions in my kind of establishment for the great American "young people," babies and old ladies seemed my natural prey.

Oddly enough, my first two boarders were neither, but two young women, one an artist and the other a professional photographer. They opened the season and stayed until Thanksgiving. They were good ones to begin on. I learned about boarders from them. They were both photograph-crazy, and instantly began taking a series of plates for illustration of the various processes of farm work — plowing, harrowing, seeding, working the vegetable garden and every operation in its turn. They hindered the men and teams to pose for them, and would come rushing into the kitchen in the middle of the morning to get me out to play the *rôle* of "the farmer in her vegetable garden" or "the lady managing her bees." It became quite a frequent occurrence to come upon familiar scenes of the home farm in magazines and even in advertisements, for they photographed me on cooking day for a popular baking-powder company. They astonished the natives by walking all over the country hatless, all but shoeless, insisting that nothing but sandals made a ten or twelve mile walk feasible, and totally unheeding the temper of the weather. When they came to go home the hat of one of these enthusiasts could not be found, but was finally discovered on the high beam in the barn, where it had been left early in the season. They spent hours photographing studies of wild flowers growing, and had many adventures with strange cows and farmers irate at having their grass land "tromped." I made them hire a carpenter to build a dark room for them in the shed, for it was too great a strain to walk into racks of glass photographic plates left to dry in unexpected places, to say nothing of stains on my floors from chemicals, and wicked-looking bottles in inopportune spots threatening my innocent and helpless guests. These

The Farm Pasture.

women, in their unconventionality and innocence of arousing any curiosity, might have passed for children, and so could read their title clear to this estate of youth.

A lovely looking old lady of that fast vanishing type with white puff curls, spectacles and lace caps came to the farm at mid-summer; perhaps claiming admittance on the score of approaching second childhood. With her were her two daughters. (Think for a minute of all the old ladies with unmarried daughters that summer in boarding houses from Maine to California. In little old New England alone the number is appalling. Every summer place is overstocked with them.) The old lady was as deaf as the proverbial adder, and her daughters very cats for spite. Their comments on everybody and everything connected with the farm, shrieked at their mother with all the windows open, served to amuse the household. "Yes, she's smart," came to me on the breeze one morning when I was at work in the dairy, "but she isn't nearly so refined looking as her sister Mary." This summary of my abilities and appearance served as a joke for many days.

A college professor with his family came seeking for two months of rest. He was a lecturer at a noted law school where there were courses for women, and even in this secluded spot he was not safe from seekers after wisdom. Two of his women pupils found him out and "came to stay." They were so intellectual that they could not let their minds have even a day's vacation, but talked law to the professor, in season and out, until he seemed likely to have to fly for his life.

The most brief visitation of the summer was from two spinsters of very uncertain age. They arrived at the farm late one afternoon from a large New England city, bringing their cat, which traveled in a black silk bag closely drawn up under its chin. A few moments after their arrival they decided to let kitty out to walk a bit on the green country grass. Now the dogs on the farm understood and respected the rights

the home cats, but the appearance of strange tabby on their domain was ough to set up a wild rush, and the ecious cat had to scramble up a tree save herself a shake up from the big rm dog. The state of mind of the two d maid "aunts" of the cat can be im- ined. They circled around the tree e the nymphs in the garden of Hes- rides, and entreated dear kitty to come wn; but, true to her traditions, the cat eferred to sit by herself in the tree, d no coaxing would induce her to de- rt her retreat. Finally, by the aid of en and ladders, the cat was rescued d restored to her agitated mistresses. l seemed serene, but further misadven- re was in store. At supper the elder the sisters partook too heartily of a h chicken salad and was violently ill the night; so the next morning the rty—cat, sack and all—shook the dust the farm from their feet and departed. appeared later that they had the repu- ion among boarding-house keepers of ing genuine wanderers, going to dozens of places each season, remaining from one day to a week, and then finding some sufficiently strong reason for leaving.

As to financial trouble with guests, in only one case was there difficulty; the professional "board-bounders" no doubt think that operating on farms is quite beneath their notice. A gentleman engaged rooms for himself, his invalid wife and nurse for one month. They were very pleasant people, but at the end of the time specified the lady was too ill to be moved, and they had to stay for two weeks longer. This extra time the gentleman objected to paying for, saying that he had not wanted to stay and that so doing had been a great inconvenience. He had not even the possible excuse of his wife's having contracted illness at the farm, for she was a chronic sufferer. He may have thought his arguments sufficiently logical to serve in doing business with a woman, but a few words from a lawyer showed him his fallacy. In contrast to this case might be mentioned

Haying.

that of one lady who was much alarmed for fear she should not pay all she ought and wanted an extra charge made on her bill for matches, as she "thought she had used more than her share!" People belonging to the latter class of payers will have more favors shown them, and it is not nearly so much of a temptation to exact the uttermost farthing in such cases.

Strange statements sometimes make it difficult to refrain from a protesting, but obviously useless word, as when a woman, in speaking to the company at large of her experiences of the summer before, spent in Maine, described with great enthusiasm the "canary-like song of the cedar wax-wing." This bird, as every lover of birds well knows, is as nearly silent as any feathered friend we have. Neltje Blanchan says of it: "One listens in vain for a song; only a lisping 'twee-twee' reaches our ears from their high perches in the cedar trees." Protest also seemed in order at the bringing into the house of some rare specimens of Habenaria. The Audubon societies protect, as far as they can, the birds, and our beautiful orchids need protection from ignorant and ruthless pickers. A great many city people have a carefully cherished belief in the illiteracy of country dwellers. A newcomer, looking over my book-cases, exclaimed, in amazement: "Why! Who reads William Morris here!"

A good deal has been said about some of the "odd fish"; but the household was for the most part made up of very attractive people, who were happy in the simple life and enjoyed to the full the quiet pleasures of the open country. Two families with small children spent the summer at the farm and the little folks enjoyed the experience thoroly. A big sand pile was made under some maple trees at a little distance from the house, and there the younger ones spent hours playing happily, varying this amusement by excursions to the brook at the foot of the cattle lane, where all sort of maritime adventures could be indulged. The older boys and girls were interested in all the industries of the farm, riding in the farm-wagons to and from the fields and watching the milking with never flagging interest. Every day they grew brown and strong, and stored up funds of vitality to last until next vacation season.

Advice is a despised article. No one wants it since the days of Job. But the best advice for a woman with a pleasant farm, a sense of humor and a need to supplement her income is, Try taking some summer-boarders. Some money can be made at it unless so low a price is charged that a good table cannot be maintained. Charge a living price, and then "Feed 'em up," as the old woman did her prize pigs.

NEW ENGLAND.

The Common Man

BY LA TOUCHE HANCOCK

ONCE on a time—no matter when—
  There lived a man—no matter where—
His name, it might be Jack or Ben,
  But which I really can't declare.

His age, I think, was—I don't know—
  I somehow quite forget how old!
He died, well, several years ago;
  At least that's what I have been told!

He had a son I'm almost sure,
  And naturally he had a wife.
He had, it may be, several more,
  I do not know, upon my life!

Who, when, or how, or where, or what
  It's quite impossible to say;
There is no record of his lot;
  At all events, he had his day.

My friend, this tale to you appears,
  No doubt, ridiculous and tame,
But probably in after years
  Of you and me they'll say the same!

BROOKLYN, N. Y.

The Peasants' Union

BY ALBERT EDWARDS

Representative of The Independent in Russia.

THE All-Russian Peasants' Union is an effort to harness the whirlwind. There are in the country over eighty million peasants. Their wrongs are matters of history; the hunger of their bodies and the bitterness of their hearts are so real that they can only be imagined. These things have a potential force which neither principalities nor powers can control — this flood of eighty million desperate men can only be checked by itself; it cannot be stilled by those upon the banks.

A short while ago a messenger came to me in Moscow saying that there was to be a meeting of the Bureau of the Peasants' Union, and that if I wished to attend I must go at once to the house of the treasurer, who was a friend of mine.

It was a chance I had been waiting for, and I hurried to her house. We had an uncanny ride, circling the city, changing from sleigh to sleigh in order to shake off possible pursuers, and dismissing our last driver in one of the outer boulevards. Then we came to an immense gray building, which had formerly been a school, but was now ostensibly a dispensary. The treasurer, my companion, was recognized by a watcher at the door, who, by a sign, told her that all was safe, and we went thru a long, dark hall into a damp, ill-lighted room.

At first I thought the place was empty, but a voice spoke to me in beautifully pure English, and over in a corner I discovered a small gray-haired man with immense glasses—the secretary of the union. He asked me a number of polite questions about the health of my family and the part of the country I came from just as tho we were meeting quite open-

Harvesting Rye in Estland. The Peasants' Quarters Are Shown in the Background.

Estonian Home with Bath.

ly on a purely social basis, and he frequently found it hard to understand my Americanisms.

We were interrupted by the entrance of a stout workwoman carrying on her head an immense basket of bread. She came in laughing, and as she swung down her load and took the shawl from around her head the transformation was remarkable. From a workwoman she became a woman of culture and refinement. She sat down on one of the low benches, and, still laughing, told us how she had just outwitted the police.

"They had watched me so closely," she added, "that I have not slept twice in the same place for six weeks. But they are so stupid. Today they were not looking for a bread woman. Why, the Sergeant Ivan himself took bread from my basket. See, here are the three kopeks." She laughed again at the thought of it.

The room filled rapidly with a strange mixture of peasants, isvostchiks, sick people with their arms or heads bandaged, and a few in ordinary European clothes. But in the dim room the peasant caps came off; the padded coats of the isvostchiks or drivers were thrown aside, the disguising bandages of those who had come ostensibly to the dispensary were pushed from sound heads and the only ones who remained unchanged were those few—very few—in ordinary dress who had not yet attracted the attention of the police.

It would be hardly correct to say that the meeting "came to order," for without any formality they got down to business. The first one to speak was a young lawyer—chairman of the printing committee — a man who I afterward heard spoke half a dozen languages and was familiar with the literary and political currents of Western Europe. He had a bundle of letters in his hand from comrades who were out in the country districts organizing the peasants. Every organizer reported that the peasants were anxious to unite and eager to read anything that could be given them, and asked for more literature.

"I must have some more money," he said. "I haven't a single printed sheet left. The last one has been sent out."

He looked appealingly to my friend, the treasurer of the bureau.

"I have nothing very cheerful to re-

port," she answered. "At our last meeting I had sixty-three rubles, and I gave fifteen rubles to Ivan Michaelovitch when he went out to the Province of Tula and the same to Maria Petrovna—you know she went down to Kharkoff. And so I have only thirty-three rubles left."

The idea of sending people out to work among the peasants in the dead of winter with only seven dollars and a half did not seem appalling to these "agitators." Another one of their number was planning to go into the North country, and they finally decided to divide what was left in the treasury—thirteen rubles for her and twenty rubles for printing. They talked over some other matters of detail and then broke up into groups to read the letters which had been received since the last meeting. The little gray-haired secretary with the great glasses sat down by my side, and I got from him the story of how the union was started.

Last spring, he told me, a nobleman in the Province of Moscow, who wished to win approbation at Court, called together the peasantry on his estate, and forced them, by threats and deceits, to sign a letter to the Czar. This letter, which was written by the nobleman, was printed and circulated thru all the empire as tho it were a sincere statement from the peasants. This began by thanking the Czar for his manifold kindnesses, and went on to say that the signers were perfectly happy, that they had all they wanted to eat, that they were in favor of keeping up the Japanese war, and that they were so enthusiastically loyal that they hated all the revolutionists, and especially those "intellectuals" who were blasphemous enough to criticise his Majesty.

Of course no one who knew the conditions believed in the truth of the letter, but it was widely circulated as a "campaign document," and might not have been challenged if it had not come to the attention of a former peasant from this village named Kurneen. He had come to Moscow as a boy and had educated himself and become a clerk in a naphtha firm. The moment he saw the letter he knew it was a lie, for his own mother had died of starvation in that village, and many of the peasants from his home visited him when they came to Moscow. He wrote a reply, which was

Estish Ploughing.

published in one of the liberal papers in Moscow, in which he clearly and forcibly exposed the real conditions in this village. The letter drew to him the attention of a number of educated people who were interested in the peasantry, and there were many conferences between them and Kurneen. The idea of the Peasants' Union was his. He knew of the labor unions in the cities; he knew of the professional unions which have co-ordinated the efforts of the professional classes thruout the country, and he advocated the formation of such a union among the peasants.

The "Intellectuals" helped him in the work, and last June a conference was called in Moscow. Altogether one hundred and two delegates came to the meeting, twenty of whom were people of education and culture, while the rest were peasants. The meetings took place in a barn a few miles from Moscow. The sessions, for greater secrecy, were held at night; the great room was dark except for a candle on the desk of the secretary. The delegates from the different sections spoke in turn, each telling of the sufferings of his people and their longing for some organization to unite them all. One delegate presented a resolution signed by the peasants of twenty-five villages in his district. Some had walked sixty "versts" to sign it. Another read a letter signed by five thousand peasants. But in spite of the great interest of their reports, the Congress became impatient before a quarter of the delegates had spoken. "The time presses—to business!" This cry was taken up, and the assembly turned its attention to organization. No labor union had ever dreamed of so gigantic a task as the organization of eighty million peasants, but it was decided that it could be done, and invitations were sent out for a general Congress.

Two hundred delegates, all peasants, gathered in Moscow on the 6th of November. They represented more than half of the provinces in European Russia. This first Congress decided on a program, and worked out a very elastic system of organization. The central bureau was to have no authority, except to call meetings and to act as a sort of correspondence center, while the greatest possible freedom was given to each group.

The Congress adopted a program which is not revolutionary in its wording. The union was to be strictly non-partisan; it would simply act as the spokesman of the peasants and not try to instruct them. The program does not directly attack the Czar nor the Orthodox Church; but it expresses the absolute necessity of more land for the peasants and demands the immediate summoning of a constitutional assembly, based on universal, direct and secret ballot. The "Land Question" is one of the most serious that faces Russia. Everybody admits that the peasant's allotments are too small, but even the peasants themselves are divided as to the remedy. Some think that the Church and crown estates should be confiscated, others favor the expropriation of the lands held by the "grand proprietors." However, they expressly state that this question must be decided by the will of all the people and they bind themselves to accept the decision of the representative assembly. Other parties — reactionary and revolutionary—are telling the Russian peasants what they *ought* to do. There is none of this dogmatism in the Peasants' Union. Their *"raison d'etre"* is simply to formulate the desires that this preponderating majority of the population already have and bring some unity and definiteness into their actions.

To carry out their idea they printed a leaflet expressing certain demands which they considered to be universal. To these demands were added a draft constitution for the local organization. This paper was accompanied by another explaining in the simplest way what each paragraph meant and stating that it was only prepared as a suggestion. Each group of peasants which joins is perfectly free to accept this constitution and set of demands, as drawn up by the Congress, or to substitute anything in their place, as they desire.

This mild program became public during the short period of the freedom of the press, when the revolutionary papers were calling on the people to arm themselves against the autocracy, and were wildly preaching bloodshed and revolt. The Government immediately recog-

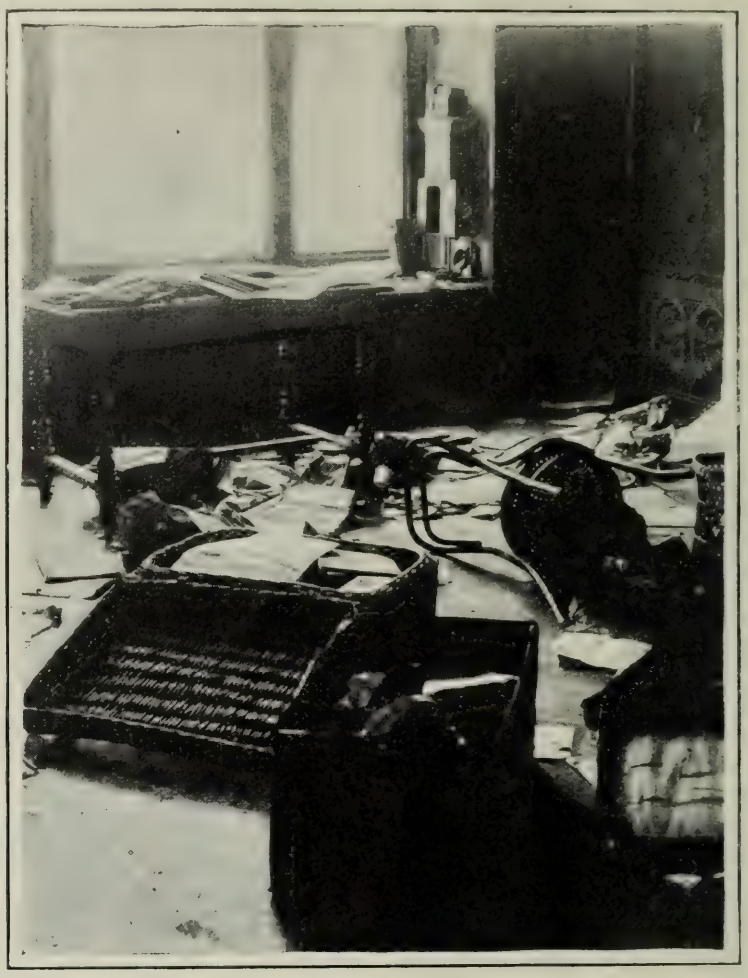
nized the danger with which this organization threatened it. For the Government relies mainly on the support of the rural communities, and it knows that this support depends on the ignorance and isolation of the peasants, so any movement which might unite them is a menace. Realizing this, they attacked the union savagely and relentlessly, and within a week of the publication of the Czar's manifesto, which promised liberty of assembly and organization, the whole central bureau of six men were arrested. Kurneen, who was thought to be dying of consumption, was released on condition that he stay in his house and sever all connections with the union. His comrades are now afraid to communicate with him — even to send him greetings—for fear that it will result in his rearrest.

The arrest of the original bureau did not seriously cripple the work of the union. Another was immediately found to take its place. At first the members had an office in the Technological Institute, but this was raided by the police and much of their literature confiscated; and now the organization is entirely "conspirative." All the meetings are held in the strictest secrecy and the printing done "underground."

The work has, of course, been interfered with by the railroad and postal strikes. I asked the secretary how many peasants were enrolled in the union. He said that it was impossible to tell definitely, as the postal strike was not over, and he had no doubt that many hundreds of letters were waiting to be delivered to them, but from the returns that they had already received he estimated that there were about one million members. Some of the peasants had accepted the printed form which had been sent them, and had added their names to it, just as it stood. Others had drawn up demands of their own. The letters from the Volga Vallay, for instance, generally added to the demands for more land and universal suffrage a demand for free rights to fish. But there was a striking similarity among them all. Coming from districts separated by thousands of miles, and from peasants of different ethnic stock, the demands were always fundamentally the same — crude and unpolished declarations of the rights of man. Many of these documents were quaint in their wording, and they were generally accompanied by curious letters from the organizer, frequently the only man in the village who could write.

"We have taken this writing to the Natchalnik (Government official) and he told us not to send it, but we have decided to do it anyhow," said one letter. The spontaneity of the movement is shown by another letter, which read: "I have never seen any one from the union, but I read in the *Sviet* that there is such a union, and as I thought it would be a good thing I called the elders of the village together and we all want to join. Please write and tell me what it is."

The *Sviet* is bitterly reactionary and would not have spoken of the union without savagely attacking it. A letter of great interest came from a village priest in the province of Novgorod. He had heard of the union and started to work to organize the peasants in the neighboring villages. His work attracted the attention of the police and he was arrested. The news scattered thru the district, and in the middle of the night he was awakened by a howling mob of five hundred peasants who had come to release him. The jailer was frightened and allowed him to stand upon a table and talk to the peasants thru a window. He says that it was necessary for him to talk to them for two hours before they would go home to their beds, and he ends his letter asking for advice as to how he shall act, for his trial was to take place in a few days and he was afraid that many of the peasants would be killed in their efforts to liberate him.



In this secret meeting of the Central Bureau in Moscow were types of the different elements making up the power of this great union. Here was a dramatist whose plays have been produced in America; here a man well known in international scientific circles for the ethnographical researches he made during his exile to Northern Siberia. Others were peasants of the type of Kurneen, men who had overcome all the obstructions with which the Government opposes any effort to rise from one class to another.

The women were all "intellectuals";

and most of them had traveled extensively in Western Europe. All of them were inspired by the one idea that the future of Russia depends on the peasantry. For they make up eighty per cent. of the population, and in the democracy, which cannot long be postponed, the fate of the nation will be in their hands.

At last this Moscow committee began to disperse. It was a long process, for it was necessary to leave by ones or twos to avoid observation. The peasant caps were pulled down over scholars' faces; an isvostchik's coat covered the dramatist; the "intellectual" put on her shawl and swung her tray of bread to her head; the bandages were again drawn over faces; and the committee began to fade away.

It is impossible to forecast the part to be played by this gigantic and rapidly growing organization. From all over the Empire, from the Black Sea to the sparsely settled country of the North, from the Baltic Provinces to the most distant districts of Siberia, peasants are writing to be enrolled. Its founders have great hopes for it, and tho all these may not be fulfilled, it is certain that in giving the peasants a means for a co-ordinated and coherent expression of their wants, it will do more than anything else to prevent these famine-stricken and cruelly oppressed people from breaking out in aimless and resultless jacqueries. Its aim is to produce a conscious change of social status. One of the letters received by the bureau began: "We, citizens (formerly peasants) of the village of ——." The Peasants' Union intends to write: "We, citizens (formerly peasants) of all the villages of all the Russias."

Bureau of the All-Russian Peasant Union, Moscow, after a police raid. For a few weeks during the so-called days of freedom immediately following the Manifesto of October 30th, the Union had its office in the Imperial Technological Society and did its work openly. Following this raid they had to become "conspirative" again.

ST. PETERSBURG, RUSSIA.

Literature

Three Books on Walt Whitman

THERE is a class of newspapers and magazines which do not circulate among normally good or normally bad people, but they are read by those who are abnormal one way or the other. They are the freak products of freakish brains, incoherent, iconoclastic, *sub rosa* calls to the wild, the native, the unmoral in revolting human nature. Walt Whitman appears to be the tutelary deity of this kind of journalism, a fact which indicates the reason why some people see so little about him in the journals and magazines prepared for them. Too many social buccaneers have nailed his mottoes to their mastheads, too many unsexed women have flung themselves into the arms of his poetry and written about it as if they had discovered a new sacred song of Solomon. Always a startling figure in American literature, these bizarre associations have made it increasingly difficult to present the man or his work sympathetically to a larger, saner class of readers. But this is what Traubel, Carpenter and Symonds have accomplished in their books on Whitman. Traubel's book[1] *is* Whitman, biographical in the same spirit that "Leaves of Grass" was his biography writ large in loose, bellowing poetic measures. No man ever succeeded more happily in getting a personality between covers. He is Boswell and Froude in one. He has not "prettified" Whitman, but he presents him as he is in his actual relation to men and things. No man is always in a fit mood to go down to history, but whatever Whitman's mood was, he went down in it to history if Traubel was there to catch it. His Boswell instinct consists in claiming admiration for everything, even for that quality in Whitman which Carpenter calls his "cussedness."

Whitman touched hands and lips with all life like a lover, and this brought him really or intellectually in contact with most of the great men and the great movements of his times. These are the topics of conversations which Traubel transcribes. They pass in magnificent review, page after page, tagged forever with illuminating comments which the utter freshness, fearlessness and abandon of Whitman's mind enabled him to make. He was a political economist who would abolish politics and politicians. He thought more highly of Ingersoll than of Gladstone, and he was particularly free in his views about literary people. But if there was anything which Whitman preferred to another, it was not to agree with the other fellows. That is why he raised up so many followers; he would not follow. A very large class of people only wait for the chance to go with the man who will not go with them. Whitman had every coarse man's aversion to mere delicacy. There was something in him which could not yield to the absolutely pure, or to anything that was not a bit suggestive of blood passion. He was a great prophet who sold out to his body and cheated his own soul with a lewd sort of immortality.

But while Traubel's face to face likeness of Whitman in all his moods is more interesting, Carpenter's book[2] contains a more definite literary appreciation of the man and his genius. He sets down the elemental forces which, combining, made Whitman what he was—his gift of loving, his prophetic spirit, his "obdurate" egotism, his power of "illumination." He regards his poetry as "the most deliberately daring advance ever made in literature." He shows us Whitman in his relation to his own time. He proves him set against that which is ordained, formulated in art, life, religion, society. He identifies him with insurgents and rebels in all realms—a man who could think that "revolution may be the only conservatism." His contention was for the larger order, the ampler movement, a wider liberty, a deeper spirit. He tried to get back of classes to brotherhood, back of literature to life, back of art to the feeling which produces art, back of thought to the thinker, back of the conditioned to the unconditioned. His in-

[1] WALT WHITMAN IN CAMDEN. *By Horace Traubel.* Boston: Small, Maynard & Co. $3.00.

[2] DAYS WITH WALT WHITMAN. *By Edward Carpenter.* New York: Macmillan Co. $1.50.

coherence comes from the fact that being but a man he tried to be the whole thing —man, beast, nature-god. And while the mind is a great plagiarist of the universal, even Whitman's splendid, unfettered intelligence could not plagiarize the whole of it.

He was the poet of democracy, and in democracy grandeur is always akin to vulgarity. Therefore it suited Whitman's genius.

"I send my barbaric yawp over the roofs of the world!" he exclaimed in a democratic frenzy of poetic emotion, and there is a harsh, raucous, challenging note in it, an insolence that fans its wings against the stars. The rhythm of it is foreign to our sense of things, because it does not measure with what we are, but with what we are to be.

The trouble with Whitman was that he did not have the right scriptures for liberty. Once he attained it, even mentally, he was simply the primitive mooseman, bellowing for an animal mate. He lacked a certain kind of judgment, the kind that is founded upon decency. Whitman despised decency. It did not fit in with a single idea he had of life. "Why shouldn't we just let go—let life do its damnedest; take every obstacle out of the way and let it go? Why should being thought foolish or unreasonable or coarse hold us back?" He thought it was right to place even a greater emphasis upon what makes for brutal beauty in life than upon those higher manifestations of mind and spirit. Now a prophet must be decent or he becomes more particularly the prophet of the indecent. That is Whitman's present predicament, a dead seer who lives in the hearts of the wrong kind of people. No man had larger hopes of happiness, but he cries them to the world like a bandit lover to his mistress. He sings his hymns to a bacchanalian tune. He shows the satyr hoof while he foretells of the new heaven and the new earth. He comes up with the very god of things upon terms of scandalous equality. We are still too provincially remote from Heaven not to resent such irreverence. And the result is that Whitman's followers are not as a rule creditable to him. A distinction must be made here, of course, between his admirers like Burroughs and Symonds, who recognized his greatness without becoming his understudies. His real disciples do not vindicate his audacity. They are usually incoordinate men and women, or weaklings, cranks and sex-insane people who take his nobler measures to express their own senile thoughts. No little pennyworth man can become a follower of Whitman without being a cheaper charlatan by the experiment. And the more valuable kind are not so likely to risk the dreadful adventure.

It is easy to understand that to a man like John Addington Symonds, classically educated, brought up in a narrow and conventional circle and condemned by poor health to a cloistered life, Whitman should have come like a breath of fresh air from the prairies. He says that when in a Cambridge college Frederic Myers first read to him aloud a poem from the "Leaves of Grass": "I can well remember the effect of his sonorous voice rolling out sentence after sentence, sending electric thrills thru the very marrow of my mind." His absorption of the Greek spirit thru its literature had prepared him to tolerate, if not to approve, of that feature of Whitman which is most offensive to the general reader. He felt that Whitman had saved him from becoming an academical prig and given him a wider faith in man, so in 1893, shortly after Whitman's death, he took some days from the few remaining to him to put upon paper his eloquent tribute of gratitude and admiration.[3]

Some Points on Eating and Etiquet

Ever since our prehistoric ancestors stumbled upon the revolutionary discovery that cooked flesh is more palatable than raw, the world has bestowed an ever-increasing amount of thought and care upon the selection and preparation of its food. Poets, philosophers, artists and novelists have found inspiration as well as sustenance in the pleasures of the table; and if some esthetic souls are shocked at such evidence of inherent grossness let them find justification for it in Owen Meredith's unanswerable query:

"Where is the man who can live without dining?"

[3] Walt Whitman: A Study. *By John Addington Symonds.* New York: E. P. Dutton & Co. 50 cents.

The close association of good literature and good food is responsible for an interesting little volume entitled *Books and My Food*.[1] The recipes contained in the book have been suggested, the preface informs us, by quotations chiefly from English novelists and poets; and apparently the aim of the compilers has been rather to enlighten the American understanding as to the composition of certain dishes made famous by English writers than to supply suggestions for "human nature's daily food." On the whole, the object has been attained; but now and again an exception must be taken to the compiler's accuracy, as, for example, when the reader is assured that "the lard cake of old England is the cruller of New England." As a matter of fact, it is a delicacy of a very different order—as any one can attest who has been privileged to enjoy the delectable "lardy cake" of the southern counties. This is a "really and truly" cake, as the children say—tho it more nearly resembles a superfine puff paste in its trick of melting in the mouth. Moreover, it is baked in the oven—a brick oven, nearly always—and is not cooked in boiling lard, as crullers invariable are.

The troubled housewife whose daily stumbling-block is the noontide luncheon will find a handy help in *Everyday Luncheons*.[2] It contains a complete luncheon *menu*—not an impossible one, either—for every day in the year, and, in addition to a great number of other useful hints, offers suggestions for the making of one hundred sandwich fillings.

The enjoyment of a meal is so dependent upon good service and good manners that it is difficult to perceive how the absence of either can be tolerated. *The Up-to-Date Waitress*[3] defines good service so clearly and comprehensively that it should be in every household. Its usefulness to both mistress and maid is appreciably enhanced by a number of excellent half-tone illustrations.

As to good manners, if there is anything concerning this much-talked-of subject which is not contained in *Correct Social Usage*,[4] by eighteen authors, the reviewer would like to know what it is. The aspirant for social success will here find exact rules for every possible phase of his or her career, not excluding the christening and funeral. Occasionally, it is true, a suggestion is somewhat ambiguously worded—as, for instance: "It is the rule to dip from one's self when eating soup from a plate." But perhaps this is hypercriticism.

In regard to the language of flowers, however—to an explanation of which several pages are devoted—one would like to ask if it can be possible that, in these prosaic days, there are people who adopt this roundabout method of making their sentiments known?

Grove's Dictionary of Music

CONSIDERABLY later than it had been expected, but still in time to be classed as one of the year's most important books dealing with the subject of music and to be welcomed gladly by music lovers, comes the second volume of the new Grove's Dictionary.* It covers the letters from F to L, inclusive, and, like the first volume, which was reviewed in THE INDEPENDENT last year, is a big improvement over the original issue of this monumental work a quarter of a century ago. The revision has been thoro and scholarly. Whereas in the original edition the year 1450 A. D. was chosen as marking the beginning of modern music and nothing before that date was admitted, the volume before us contains an excellent article on Greek music. A shorter one on Japanese music is also good.

Among these technical articles the most important is one on "Instrumentation" (in place of the inadequate treatment of the subject in the old edition under the heading "Orchestration") by Frederick Corder, who has prepared a better summary on this subject than can easily be found elsewhere, and has made it interesting as well as instructive. He is in sympathy with modern progress,

[1] BOOKS AND MY FOOD. *By Elizabeth Luther Cary and Annie M. Jones.* New York: Moffat, Yard & Co. $1.00.

[2] EVERYDAY LUNCHEONS. *By Olive Green.* New York: G. P. Putnam's Sons. 90 cents.

[3] THE UP-TO-DATE WAITRESS. *By Janet McKenzie Hill.* Boston: Little, Brown & Co. $1.50.

[4] CORRECT USAGE. A Course of Instruction in Good Form, Style and Deportment. Two volumes. New York: New York Society of Self-Culture.

* GROVE'S DICTIONARY OF MUSIC AND MUSICIANS. *Edited by J. A. Fuller Maitland.* (In five volumes.) Vol. II. New York: The Macmillan Co. $5.00.

and tho he does not hesitate to rebuke those who employ complexity for its own sake—to astonish an audience, worry an orchestra and hide the weakness of the musical structure beneath the dazzling surface — he brings his little treatise down to the present day by quoting from several orchestral scores of Richard Strauss, and even mentions the "heckelphone" (baritone oboe), invented in 1904, and used by Strauss in his latest composition. He pronounces the scores of Tchaikovsky, whom he considers the most brilliant exponent of "the new orchestral language," to be unsurpassed for educational purposes, "owing to the comparative simplicity of the effects and the perfect certainty of their results."

A few old-time musicians who were overlooked in the first edition, or who have been rediscovered by modern research, are included now; but for the most part the new names are those of men who have come into prominence in the last twenty-five or thirty years. Practically all of the German, French, Italian, Russian and English composers (whose names fall within the section of the alphabet covered) are included. Such men as Fauré, Edward German, Glazounov, Gleason, Gliere, Victor Herbert, d'Indy, Ippolitov Ivanov, Kalinnikov, Konius, Lamond, Loeffler, for instance, are to be found along with the older music makers. But one looks in vain for Halvorsen, Jongen, Krug, de Lara, Limnander, and such Americans as H. F. Gilbert, Goldbeck, Rubin Goldmark, Hadley, Huss, de Koven. Indeed, Americans do not receive quite as full treatment as might have been asked for them legitimately in a book intended just as largely for the American as for the British market.

The Italian in America. By Eliot Lord. New York: B. F. Buck & Co. $1.50.

This book is made up of a series of essays on the various phases of Italy's contribution to American development and citizenship. The material used by the author is gathered from the available sources on the subject of immigration and the foreign born in the United States, and no endeavor is made to discover new conditions or present new theories relative to the immigration problem. The part played by the Italian laborer in American industry, agriculture and mining during the last two decades is clearly presented. In New York city, where the Italian population approaches 400,000, and the value of their material property is estimated to exceed $60,000,000, Italians are found in almost all employments, both skilled and unskilled. As agriculturists in the South and West they have been eminently successful, and a number of Italian farm colonies are in a prosperous condition. In several of the Southern States they are devoting themselves, with considerable success, to cotton raising, thus disproving the popular theory that European white labor is unable to compete with the negro in this occupation. The number of Italian immigrants that become tillers of the soil in this country, however, is comparatively small, despite the fact that they are largely of the peasant class and hence accustomed to rural life. The bulk of the immigrants settle in the large cities, where they readily find both employment and congenial associates. The evils resulting from this congestion in large cities and the need of more equitable distribution of Italian immigrants thruout the land, together with their potential value as agricultural laborers and truck farmers, are topics ably discussed by the author.

Christianity and Socialism. By Washington Gladden. New York: Eaton & Mains. $1.00.

Dr. Gladden endeavors to define socialism fairly, using as his authorities the ablest and most widely recognized exponents of the socialistic theory. He does not regard socialism as an alarming peril, nevertheless he does not accept it as a practical scheme of government. His own position is the progressive coordination of socialism and collectivism, tho he favors an extension of the socialization of industries, particularly in the United States, and especially wider recognition of the sentiments of justice and fairness which give life to the socialistic movement. It were well if all clerical pronouncements on social questions were marked by Dr. Gladden's thoroness of information and his earnest sympathy with the problems of the men who work.

Greece from the Coming of the Hellenes to A. D. 14. (Story of the Nations Series.) By E. S. Shuckburgh, Lit. D., Lecturer in Ancient History in University College, London. Pp. xix, 416. New York: G. P. Putnam's Sons. Cloth, $1.50. Half leather, $1.75.

The displacing of Prof. J. A. Harrison's rather inadequate and in places flippant work in the Story of the Nations series by a new book is amply justified. It will materially strengthen the series. This book does not stop with the Macedonian conquest of Greece, but extends over the rise of the great kingdoms, semi-Hellenized, which followed Alexander's death, and deals with the painful events which by successive steps led to the suppression of the Greeks. Even the Silver Age of Greece passed, and a Roman empire, less cruel than the republic, but allowing no revival of civic life in Greece, came on. Rome flooded all. Greece was submerged. While it is with a sickening sensation that we see city after city in Greece sacked and the bulk of its inhabitants slaughtered or sold into slavery we must remember that the Romans — even Sulla himself — were not much more cruel to the Greeks than the Greeks were to one another. Spartans slaughtered Argives and wiped out Plataea. Athens butchered the Urelians. And these were neighbors and of the same kin. The book has two maps and a plan of Pylos, sixty-two illustrations, among which are sixteen busts or statues of famous men, and some of the more striking masterpieces of ideal sculpture. Several illustrations are poorly reproduced, e. g., pp. 31, 43, 47, 103, 223, 245, 279. There is much inconsistency in spelling. Greek names are usually Latinized; but we find *Pelasgoi, Argeioi, Achaioi* and *Dauaoi;* also *Polycleitos* and *Paros* on the same page with *Lysippus. Theseium* is strange. The maker of the first map, p. 1, has out-Latinized the Romans and used the forms *Parus, Melus, Delus, Chius, Samus,* etc. On the other map we find *us* and *os* used indiscriminately. So far are we from a uniform system of spelling Greek proper names. Poor misprints are *Aegenitan,* 107; to *the* Salamis, 117; *Chalicidians,* 178, *Chos,* 185; *Pirene,* 231; *Perses,* 305; *Caunes* and *Adrymitticum,* 325. The sketch of the history of Greek literature seems inaptly tacked on at the end of the book of which it is the least satisfactory part. A few allusions to the authors and their works in their proper setting in the narrative would have been much more effective. The remark, p. 238, that "Lamia is some twenty-five miles north of Thermopylæ" shows a lack of personal observation. The distance is barely ten miles.

Charlotte Brontë and Her Sisters. By Clement K. Shorter. Literary Lives. New York: Charles Scribner's Sons. $1.00.

As Mr. Shorter says, the only life of Charlotte Brontë to read is Mrs. Gaskell's. But he adds, in justification of the present venture, for which the publishers are probably more responsible than he: "Much new material has been published since Mrs. Gaskell wrote, and this material has not in the interval been gathered into one brief narrative." For that task Mr. Shorter is well qualified. He has made himself an authority on the subject, and it was he who furnished the notes to the standard Haworth edition of Mrs. Gaskell's life. If this volume, then, be taken as represented, as a supplementary digest of new matter, there is a place for it beside the older biography, and it will be read with interest and to advantage even by those who are thoroly familiar with the latter, altho in itself it neither possesses nor pretends to those qualities which give Mrs. Gaskell's book its position, and to which the Brontës themselves are probably indebted in some considerable degree for the romance investing their names.

From a College Window. By Arthur Christopher Benson. New York: G. P. Putnam's Sons. $1.25.

The attraction of these essays of Mr. Benson's is due to several causes. In the first place, they have to do with life—not with this or that profession or industry or interest, but just life itself more or less as it is or seems to be. The point of view, to be sure, is that of the educated, or, rather, the cultivated, man; but the outlook upon life is so direct and the language is so plain as to seem guiltless of anything academic or scholastic. Indeed, this simplicity of style will be felt,

no doubt, as one of their chiefest charms. And yet there is in some way about these apparently innocent sentences a little air of affectation — perhaps because they seem unnaturally ingenuous for this time of day, when the consciousness of the writer must needs partake to some extent of the complexity of his civilization. Probably it would be too much to call this quality artifice; to have a name for it, however, would be very convenient, for it is a persistent characteristic of the essays—and surely Mr. Benson will not object to the name, art. His art, then, reappears in another form and very agreeably in a feeling of intimacy that he manages somehow to convey, a sense of indiscretion, as tho he were letting you into the possession of his own secrets and those of his friends, without giving you, after all, very much that you can lay hold of. He himself has described the effect in the paper on "Conversation." "But at once to stimulate and gratify curiosity, and to give a quiet circle the sense of being admitted to the inmost *penetralia* of affairs, is a triumph of conversational art." And to such an impression his own success is largely due.

The Historical Relations of Medicine and Surgery to the End of the Sixteenth Century. An address delivered at the St. Louis Congress in 1904 by T. Clifford Allbutt, M. A., M. D., Regius Professor of Physic in the University of Cambridge. New York: The Macmillan Company.

There is a very general impression that all of the important details of medicine and surgery are distinctly modern. Our heritage from centuries before the nineteenth in medical practice is supposed to be very little. Those with such a view, however, will be surprised to find how many things of interest and intensely practical character Professor Allbutt has found in the medicine and surgery of even so distant a century as the thirteenth. For instance, William of Salicet, who taught at Bologna, discovered that dropsy may be due to a hardening of the kidneys, tho this is supposed to be the discovery of Richard Bright at the beginning of the nineteenth century. He investigated the causes of the failure of healing by first intention, the feature of Listerism in the later nineteenth century. He emphasized the danger of wounds of the neck, and advised his students always to suture divided nerves, though these are supposed to be details of very modern progress in surgery. His disciple, Lanfranc, who taught at the University of Paris, went even farther than his master. He distinguished between venous and arterial hemorrhage, and used styptics for the control of venous hemorrhage, while he advised digital compression of a divided artery for an hour, and in the case of large vessels suggested the ligature. His chapter on injuries of the head is a classic in surgery. He had much to say with regard to amputations, and the use of ligatures, and the necessity for not including the nerve in the ligature when tying the arteries. This is supposed to be quite a recent recommendation, and no one would think of attributing to it an existence of seven centuries. Much of Professor Allbutt's little book makes it very clear that the university training of the later Middle Ages—in medicine, at least—did not differ much from our modern education, and was quite as direct and practical.

Memoirs of a Royal Chaplain, 1729-1763. The Correspondence of Edmund Pyle, D. D., Chaplain in Ordinary to George II, with Samuel Kerrich, D. D., Vicar of Dersingham, Rector of Wolverton, and Rector of West Newton. Annotated and Edited by Albert Hartshorne. London and New York: John Lane. Pp. viii, 388.

To some extent the *Memoirs of a Royal Chaplain* are distinctly disappointing. The title suggests that Dr. Edmund Pyle was much at Court in the days of George II; and any volume which would add to our first hand knowledge of George II and his Court could not fail to be of interest and of permanent value. There is, however, very little about the King in Mr. Hartshorne's volume. Dr. Pyle was never near enough to the Court to have any intimate knowledge of it. His letters to Dr. Samuel Kerrich show no such intimate knowledge; but they are full of the huckstering over clerical patronage which was so characteristic of the Church of England in the middle Georgian period of its history. These letters are not pleasant reading. They must be far otherwise to English peo-

ple, who are deeply attached to the Church, and who endorse the claim of its bishops and priests as to apostolic succession. As part of the history of the Church of England in what were perhaps its most degenerate days these letters have an obvious value. But all readers who are not special students of English ecclesiastical and political history in the eighteenth century should follow a reading of the Pyle-Kerrich correspondence with a careful perusal of the "Life and Letters of Mandell Creighton," reviewed in THE INDEPENDENT about a year ago. Better than any other volumes of clerical letters and reminiscences that have yet been published, the Pyle-Kerrich correspondence and the "Letters" of the late Bishop Creighton mark the enormous distance on the road to more wholesome and lovely conditions which the Established Church traveled between the early years of the reign of George III and the end of the reign of Queen Victoria.

The Silver Age of the Greek World. By Prof. J. P. Mahaffy. Chicago, the University of Chicago Press. 485 pp, 8vo, cloth. $3.

Professor Mahaffy's "Greek World Under Roman Sway," now out of print, here reappears under a new name, "in a maturer and better form, and with much new material added." No one has ever caught Mahaffy writing anything dull. In spite of dealing with a declining and disintegrating civilization, he holds us fast with his apt parallels from modern life. The golden age of Hellas is gone. From Alexander's conquests resulted great monarchies; but the Greek cities, the old homes of Greek life and culture, has suffered decay. Half Hellenized potentates still toadied to Athens and helped to adorn it. But still darker days came. The organized power of Rome shut down like a pall. The tax-gatherer was everywhere. The poor lapsed into absolute slavery. But even now, under the republic, Greeks thrived as teachers at Rome, since men of rank felt that they must have culture. Some even made the journey to Greece. The Roman literature that sprung up in the second and first centuries B. C. was inspired by Greeks. But this was an age of silver and not of gold. Two figures in this age —Cicero, so proud of his acquired Greek culture, and Plutarch, the last representative of the native Greek culture—have a lasting interest. Cicero is here seen as a trimmer, "who, like most men of great intellect and weak character, try to act as mediator between extreme men on both sides." It was Cicero to whom the retort was made in the theater, "It is odd that you should be squeezed, seeing that you generally sit on two stools." A trimmer in politics, he suffered disgrace and death; but as a mediator in letters he earned lasting fame and favor. "He was the first to appreciate and translate Greek thought of the highest kind." His prose became a rival of the best Greek prose. In his long residence in Greece he showed no enthusiasm over that magnificent land, its cities and its art. Philosophy was all in all to him. The one character, charming above all others of the period, is sweet old garrulous Plutarch, "the last of the Greeks," a man of the better life, whom neither Athens nor Rome could draw away from his native Chæronea. He "would not make that small town smaller by leaving it." A very good *résumé* of his voluminous works, touching on thousands of topics, trivial and important, is not the least interesting feature of this book, and Plutarch is the true representative of the Silver Age.

The Taxation of the Liquor Trade. By Joseph Rowntree and Arthur Sherwell. Vol. I. New York: The Macmillan Co. $3.25.

In previous works the authors have jointly treated of the social and political aspects of the liquor traffic, but in the present volume, in which the taxation of the publican is treated, the fiscal aspect of the problem is dealt with almost exclusively. The work is intended as a part of a comprehensive study of the taxation of the liquor trade, which is designed to include a historical and detailed examination of the liquor license duties and the beer and spirit duties. The data is not confined to Great Britain. In fact, the authors, by comparing the taxation of publicans in American States and cities with similar taxation in England show conclusively that the latter is not

only inadequate but anomalous. The average rate of license taxation in 122 towns of the United States having a population exceeding 30,000 is $835, as against an average of $175 charged in similar towns in Great Britain. If the comparison be made with particular States or certain geographical divisions, the difference in the standards of license taxation is even more pronounced; the average license duty in twenty-one New England cities, for example, being ten times the average rate of license duty in similar cities in the United Kingdom. Naturally, the revenue received from the taxation of the retail liquor traffic is much greater in this country than in Great Britain. In the 164 British towns having a population of 30,000 and upward, the proceeds from this source is approximately $4,080,000, whereas in the 122 American towns of the same size it is $36,975,000, or more than nine times as much. The authors emphasize the necessity of higher taxation of the retail liquor trade in Great Britain both upon fiscal and social grounds. The policy of limiting the number of public-houses for the retailing of liquor by the action of the community has resulted in creating a monopoly of the liquor traffic, and has increased enormously license values without a similar increase in the scale of taxation. The number of retail liquor places in Great Britain is less today than in 1880, tho the quantity of liquor sold is much greater. The authors hold that a high license, regulated according to the amount of business done, is a far better check to excesive drinking than an arbitrary limitation of the number of restaurants and drinking places. Excellent tables and diagrams thruout the book illustrate clearly the arguments presented by the authors.

Somerset House: Past and Present. By Raymond Needham and Alexander Webster. New York: E. P. Dutton & Company. 344 pp. $3.50.

The Somerset House, which occupies most of the pages in the scholarly and exceptionally interesting work of Messrs. Needham and Webster, is not the Somerset House that is so familiar to American visitors to London. The building about which most of the historic traditions centered is not the comparatively modern structure which fronts on the Strand, about midway between Surrey and Wellington streets; not the magnificent building which is seen to such advantage from Waterloo Bridge or the Thames embankment. The history of Somerset House of today—the center of the fiscal organization of Great Britain—is recounted with much detail by Messrs. Needham and Webster—all of it well told and all of it interesting. But it is the earlier Somerset House—that which was built by the Protector of Edward VI., and which survived until the last quarter of the eighteenth century—that occupies most of the book, and gives it its peculiar charm. And it has this charm to a remarkable degree—a charm which is excelled by few even of the best standard works on the historic buildings and topography of London. The Protector did not live to complete Somerset House. Somerset and his head parted company on Tower Hill, in 1552, quite a little time before Somerset House was out of the builders' hands. Still Somerset had taken infinite pleasure in raising what in the middle years of the sixteenth century was the finest domestic edifice in England; so much pleasure that John Knox declared to Somerset's reproach that he preferred watching the masons to hearing sermons. Much of the land covered by Somerset House, even many of the stones of which it was built, had come into Somerset's possession when the monasteries were dissolved; and after the Protector's execution, Somerset House became the property of the Crown. Queen Elizabeth was the first regal owner of Somerset House, and she used it much as her London home when she was still only a Princess. Later on it became the dower-house of the consorts of the English kings, and was so regarded from the reign of James I. to that of George III. Then, about 1761, what is now Buckingham Palace became the Queen's House—the "Queen's House" of George III.'s voluminous correspondence—and with this change Somerset House ceased to be closely associated with royalty, except so far as the collection of the King's taxes is concerned. It was the scene of much that was important in the political, religious, and

social history of England from the days of Mary to the Revolution of 1688; and altho Messrs. Needham and Webster have not undertaken to rewrite the history of Engiand during these hundred and thirty years, they have interwoven into their history of Somerset House much that is new, or rather much that has never found its way into the pages of the standard English histories.

The Four Million. By O. Henry. New York: McClure, Phillips & Company. $1.

The Four Million is the felicitously named collection of short stories by O. Henry concerning the people of New York. The author thinks that no cold "Four Hundred" should limit our interest, as there are at least four million people in the metropolis who are worth writing about. And as there are only twenty-five stories in this book, he will have material for many days to come. A bit of work like "The Unfinished Story" is of more value than many long and labored books upon social conditions, and there are other stories in the volume, pathetic, humorous and human, which widen our sympathies until they take in the joys and sorrows of the four million who are living the real history of New York.

Pebbles

GOSH!

I THINK I'll have to tell about
That funny dream of mine;
I thought I was a centipede,
And tried to get a shine.

—*Princeton Tiger.*

MICE are supposed to send the female sex into hysterics, but here is a case of rats. A Boston shoe store recently received the following hysterical letter from a certain miss by her attorney.

"GENTLEMEN—Take notice that on the afternoon of April 4 last I received severe physical injuries from there having become secreted on my person from your store a large rat, which escaped from a cat in your store while I was trying on shoes there, and hid on my person unknown to me. Said occurrence and accident was caused by the negligence of the clerks, agents or servants in your store. I claim damages for the injuries received."—*The Standard.*

SINCE 4,755,801,600 barleycorns reach around the world, and the average egg is seven barleycorns long; and since, according to Uncle Sam, there were produced last year in the United States eggs sufficient when placed end to end to reach around the world fourteen times and still have 328,396,800 eggs to spare; now, suppose that the entire number of eggs were made into an omelet soufflé, proportionate to an omelet of six eggs made in the shape of a frustum of a cone—size before baking, hight, five inches; diameter of lower base, seven inches, and one inch at upper base (top of chimney). What would be the hight of such an omelet (before baking) and what would be the diameter of its base?—*The Stewards' Bulletin.*

RULES IN CASES OF EMERGENCY.

IN going down a fire-escape never precede a lady.

In case of fire leap from the nearest window and turn to the left.

In drowning do not speak. Talking to one's self is always bad form; but in this emergency it would also be extremely silly.

In falling from the back of a runaway horse always aim to let the left shoulder hit the ground first, as it is far better to break one's arm than to fracture one's skull.

If a heavy plate-glass window falls upon you some cold winter morning do not scream, as you might, in opening your mouth, catch tonsilitis—to say nothing of several large pieces of glass.

If you happen to be in a theater when the cry of "Fire!" is raised, sit perfectly still. Of course no one ever does this, but it is just as well to bear the rule in mind. Authorities differ as to whether it is better to be trampled to death or burned alive.—*Judge.*

POEMS YOU OUGHTN'T TO KNOW—NO. 23.

THERE was a lovely, gentle youth,
Who, sorry to relate,
Was cursed with a terrible,
Gadzooks! an awful fate;

For all his body measurements
Were made peculiarly,
And every single thing he wore
Was just size 23.

His height was 5 ft. 23,
His shoes likewise skiddoo,
His tailor always said to him,
"Just 23 for you."

His birthday was the twenty-third,
2-3 the telephone;
Of cousins there were 23
(The twenty-third was Joan).

His bills amounted to skiddoo,
He worried terribly,
He only slept one hour per day,
And that left twenty-three.

At 23 years of age he died
('T was not for lack of food);
They sadly said he passed away,
But really he skiddooed.

—*Harvard Lampoon.*

Editorials

To the Readers of "The Search-Light"

WITH this issue of THE INDEPENDENT the thousands of subscribers of *The Search-Light* move over in a solid body to swell the ranks of the army of INDEPENDENT readers. At this moment of the transfer of the loyalty of *The Search-Light* readers to the new, yet older, periodical, I wish on behalf of my colleagues and myself to say a word of farewell to our friends and to express our grateful recognition of their constant kindly encouragement, enthusiastic support and inspiring words of appreciation.

When the first issue of *The Search-Light* appeared on January 7th, 1906, the plans for a condensed weekly, on novel lines, covering the news and progress of the world, had been carefully matured. As a nucleus for development *The Week's Progress,* formerly *The Great Round World,* was purchased. The new weekly had behind it a new idea; it was to represent a clearing-house of the activities of the world. Material from the newspapers, magazines and reviews of the world was cut, collected and classified under sixty separate departments, sweeping the circle of human thought and interest. Of these departments ten carrying the news appeared in each issue, the others covering the world's progress were published whenever the accumulated material made it seem desirable. With the reports from a dozen to fifty different sources on a single topic, the department editors fused the vital elements of all into a singly short article. The largest collection of classified clippings and pictures in the world, forming *The Search-Light's* unique information library, enabled the editors to give the origin, early history and development of important movements or of events forgotten or unknown by general readers. A careful follow-up system gave from week to week the new developments on any important topic until the subject had been finally terminated and the interest ceased. A novel continuous index enabled the reader to find at any moment any item that had ever appeared in the pages of *The Search-Light.* The aim of the projectors to make the paper not only a condensed weekly, but a continuous supplement to all cyclopedias, met with quick recognition, but it was found impossible with the limited capital at the command of the projectors to give the paper that broad general publicity that was necessary to reach the turning point that means crossing the Rubicon of success.

It was then deemed advisable to combine *The Search-Light* circulation with that of some firmly established publication along the same general lines, and THE INDEPENDENT was selected as the one most in harmony with the spirit of *The Search-Light* as a news weekly, with its condensed "Survey of the World" and its splendid articles by the world's authorities on vital topics of contemporary interest. In this merger, to use the term of "frenzied finance," THE INDEPENDENT takes over the subscription list of *The Search-Light,* and will fill all subscriptions for the unexpired term.

THE INDEPENDENT, established in 1848, has, in its long and honored career of nearly sixty years, stood in the front rank of the virile, vital weeklies of the nation. It has ever been keen, alert, progressive, in constant harmony with the best thought of the times. It has justified its name by its broad-gauge policy, its wide sympathy and its firm stand on the square issue of right on the great questions of the times. In the parting with our old subscribers and friends it is with genuine pleasure that we feel they are committed to the kindly care of so able a weekly as THE INDEPENDENT.

Changing from one periodical to another is much like moving into a new house; it takes a little time to grow accustomed to the new atmosphere and to fit cosily into the new surroundings; but we feel confident that a very short familiarity with THE INDEPENDENT will win for it, from our readers, the same

loyalty, enthusiasm and appreciation with which they honored *The Search-Light.* WILLIAM GEORGE JORDAN,
Editor *The Search-Light.*

To Our New Readers

THE INDEPENDENT welcomes its new readers. It desires their approval and continued support. We have known and valued *The Search-Light* under that name and under its previous designation as *The Great Round World.* Both names implied its aim, to gather the current events of the week in various departments of interest. THE INDEPENDENT also carefully studies and records the same wide field in its "Survey of the World" and in its other departments; and it is our hope that our new readers will miss but little and will gain much by the exchange.

To those of them who have not been familiar with THE INDEPENDENT we will say that it is an established journal, which has had much influence and success in its career of nearly sixty years. Seven years ago it took the more convenient form of a magazine, after successive enlargements had made the newspaper form unwieldy. Its first pages are given to the "Survey of the World," both home and foreign, and this department is particularly in line with the character of *The Search-Light.* Equally its popular illustrated articles are to be compared with those in *The Search-Light.* Our new readers will not be sorry to find an additional feature in our contributed articles, which we seek from the most capable and distinguished writers, and which cover an immense variety of serious and lighter subjects. It is our aim to provide instruction, even more than entertainment, to our readers, and we believe this feature will be appreciated and approved. Equally our new readers will find that our editorial departments, in which we include the careful review of all important new books, are full of instruction and inspiration. We propose to be in full advance with new thought and knowledge. THE INDEPENDENT avoids no question that interests the people, and it is its aim to express well considered opinions on as many public topics as possible. There was a time when THE INDEPENDENT was a definitely religious journal; but of late years it has ceased to be such; and it now covers all fields of public interest, whether political, literary, scientific, social or religious, recording all that has value, discussing all, and seeking to help the right cause and evolve the truth in every way in our power.

Thus we give our warmest welcome to our new readers, assuring them that we will do what we can for their pleasure and profit, and trusting that whatever they may miss will be more than made up. We thank Mr. Jordan, late editor of *The Search-Light,* for his kind introduction of THE INDEPENDENT to his readers, and we accept with confidence our new responsibility to our new friends.

Mr. Bryan

ONE of our contributors says, at the end of an article about Mr. Bryan, which appears elsewhere in this issue:

"When he left America he was practically ignored. His reception on his return promises to be one of the greatest which the American people have ever given a man in any station of life.

"Why?"

It is true that Mr. Bryan was not escorted to his ship at San Francisco by prominent citizens and brass bands. But he was not ignored by the people of the United States. Altho there had not been (following the election of 1904) a perceptible revival of popular interest in the average "leading Democrat" of the ordinary type, Mr. Bryan held an exceptional position. He had not gone down with the wreck. He was not held responsible for the overwhelming defeat. He was only forty-five years old, and people felt that he must still be reckoned with.

Why is he to have a grand reception when he lands at New York in the last week of August? He has borne himself with dignity thruout his long journey. An American who has been honored twice by the nomination of one of the great parties for the Presidency deserves to be welcomed heartily by other good Americans when he returns from a tour in which he has so creditably represented

the American people in many parts of the world. It is by Democrats, however, that he is to be received, and they welcome him as the foremost candidate for the Democratic Presidential nomination in 1908. Why are Democrats all over the country saying that this twice-defeated man must lead them again?

One reason is that he is much more "available," as the politicians say, than any other possible candidate in sight. The list is short. Mr. Bryan, a few days ago, could find only three of these gentlemen, "Congressman Hearst, Senator Bailey and Governor Folk." Mr. Hearst withdraws, at the same time putting his knife into Mr. Bailey. Governor Folk, altho a man of force and achievement, has somehow failed to find a place in national politics. No more "safe and sane" candidates of the Judge Parker type are wanted. That venture too vividly recalls an electoral vote of 336 to 140, and a hostile plurality of 2,541,000 votes. To whom shall a vast majority of the party turn, if not to Mr. Bryan?

Another reason, and the most effective one, is that Mr. Bryan distinctly represents that popular revolt against lawless corporate power and privileged monopoly of which Mr. Roosevelt is the leader.

A current cartoon pictures Mr. Bryan rising from the tomb, naked, and gazing with dismay upon an empty suit case, from which Mr. Roosevelt has abstracted his clothes. "But they don't fit him," said Mr. Bryan in London last week. There Mr. Bryan was in error. They *do* fit Mr. Roosevelt; but they do not fit nicely on the Republican party. Here we must make a distinction between a majority of the party's political and legislative leaders or representatives, and a majority of the rank and file. The latter are in sympathy with the President; many of the party leaders are not.

So far as the leaders in Congress and elsewhere are concerned, Mr. Roosevelt has taken his party by the collar, and thus induced it to accept and support his reform policy. With them, he has been a driver, rather than a leader. But a majority of the rank and file did not need to be driven. Explanation, exposure, and a little exhortation were enough for them. They are a part of the great mass of ordinary American citizens who, whether Republicans or Democrats or partisans under any other name, love justice and are glad to applaud and assist those who enforce it.

Mr. Roosevelt's public addresses, his suggestion of or demand for important reform measures, and his persistent advocacy of those measures, have (with the aid of much unofficial or official muckraking) created and so stimulated sympathetic public opinion in his own party that the leaders of that party must go forward with the work or expose the party to the risk of defeat, altho they are supported now by that immense plurality, and a majority of almost two to one in both branches of Congress.

Democrats, Gold and Silver, who now hasten to the support of Mr. Bryan want to take the President at his word. "Under no circumstances will I be a candidate for or accept another nomination." They hope he intends to retire at the end of his term. They very earnestly desire that he shall stand aside. When Mr. John Sharp Williams says he thinks the President is "planning to be forced to run again," he knows that such remarks inevitably tend to confirm the President's original and expressed determination to get out. Mr. Williams has some knowledge of human nature.

We do not know what will be done two years hence. If the Republican convention should be held next week, Mr. Roosevelt would be nominated by acclamation and find much difficulty in withdrawing. If he should decline a nomination in 1908—and we believe he intends to do so—would the Republican nominated to succeed him be regarded by the rank and file as a man who would surely sustain and promote the reform policy with which Mr. Roosevelt is identified? Would the masses look upon him as a man powerful and persistent enough to keep in subjection the anti-reform influences which have sometimes been potent in the party, and which Mr. Roosevelt has overcome?

If not, then a considerable number of those who voted for Mr. Roosevelt in 1904 might vote for Mr. Bryan. They would stay with Mr. Roosevelt, but they might cut loose from the man nominated to take his place; and of all possible Democratic candidates Mr. Bryan (now

that silver is a dead issue) would be most attractive to men thus changing their allegiance. We have in mind the many who would be satisfied with nothing short of continued and successful effort along the lines of Mr. Roosevelt's policy concerning the restraint of wealth and corporate power. Would the nomination of Mr. Taft or Mr. Fairbanks or Mr. Shaw have their support at the polls?

Or could Mr. Bryan get enough of them to do him any good? Such questions suggest the main reasons for the enthusiasm and hopefulness which are to characterize the approaching reception of Mr. Bryan. Two years will pass before the nominating conventions are held. It is futile to attempt predictions as to what the situation will be or as to what will be done. This year's crops are large, and probably our national prosperity will continue for at least a year or two. If so, radical opposition movements will not be assisted by prevailing conditions. Again, Mr. Bryan unwisely handicaps himself by advertising his loyalty to bi-metalism. And there may be a third party, upon a platform more radical than his, and possibly drawing to its ranks two or more Democrats for every one Republican. Mr. Roosevelt has left for Mr. Bryan in the field of radicalism very little outside of socialism, and into socialism he declines to go.

Whatever shall happen, Mr. Bryan for some time to come will be a very interesting figure in American life. And his political future may be shaped by the policies and purposes of a more interesting man of almost the same age, who lives in the White House.

Improving One's Neighbors

Almost as strong as the passion to "do" one's neighbors is the passion to do them good. It has sometimes seemed to us provincial Americans that both passions are abnormally developed in our British cousins. The passion to "do" led to a little unpleasantness between them and us a century ago, and the passion to do good has from time to time awakened our resentment since. In fact the ostensibly more commendable passion now annoys us more than the reprehensible one does, because we think that it would be difficult for any of our European kindred to "do" us seriously, while we still have an uncomfortable feeling that when they offer to do us good there may be some remnants of ground for their arrogance.

Of course we do not believe that they could do us good in a moral way. In morality we know that "we are the people," and that virtue shall arrive with us. It is in manners, in esthetic appreciation, in nice discriminations of things vain and worldly that we suspect ourselves of immaturity, inadequacy and rusticity. We wonder if perhaps we do not need to be taught, but we don't love the people that offer to teach us.

Now, our British cousins, on their part, are lacking in a certain fine sensitiveness. An American might not know that he ought not to wear his claw-hammer coat to a five o'clock tea, but let him once learn that the claw-hammer and the dinner gown are immodest by daylight, he will shrink from too brusquely handing on this information to his uninstructed neighbor. He has a certain capacity for sympathetically feeling his neighbor's pain in the educational process. Not so our British preceptor. He has so long been used to instructing "the lower orders" in all matters of Church and State, that he unconsciously assumes that all people in need of instruction belong to "the lower orders," and therefore cannot have feelings to be hurt. He goes about his business, therefore, in a prompt, indelicate way that has all the merit of a remorseless surgical operation. It is ruthless, but effective.

The International Congress of Architects is about to convene in London. Among the delegates will be men of more or less renown, not only from Germany, Italy and France, but also from Australasia, British North America and the United States. These gentlemen, altho they know something about art and esthetic canons in general, are presumably unacquainted with the ways of good society. At any rate, it would not be well to leave to chance and to them any of the essentials of successful social functions. The official program of the Congress therefore thoughtfully offers to the doubtful element the following adequate instructions:

"The attention of foreign members is called to the fact that evening dress is never worn

during the daytime in England, but always at an evening function. On ceremonious occasions, such as the inaugural meeting at the Guildhall, a frock coat should be worn."

Altho it is naturally unpleasant to have to be instructed in such matters in this official and explicit way, we hope that American delegates to the Congress will take it in good part, and will carefully do all that is expected of them. They should remember that, altho Newport and Lenox and the Faubourg San Antoine have certain just claims to recognition as centers of fairly good social manners, "in England" we look for pre-eminence, and it is better to adhere strictly, in all cases of doubt, to the usage "in England." While, therefore, it might be permissible to wear evening dress at a morning session of the Academy, under the shadow of Voltaire's statue on the left bank of the Seine, or at the Newport Casino about lunch hour, or on the golf links at Lenox after sunrise, "in England," since evening dress "is never worn during the daytime," ordinary courtesy requires that architects and others, accepting British hospitality of a somewhat formal kind, should be provided with suitable tweeds and Prince Alberts for morning attire.

Perhaps we are too cosmopolitan and not quite as patriotic as we ought to be, but we venture to go even further in our counsel of humility, and advise our countrymen to ignore the little smart that they can't help feeling at being included among the recipients of this British instruction, and to accept it not only for the special occasion for which it is offered, but for all occasions, including social functions on this side of the Atlantic. England is socially older than America, and her experience carries a certain presumption in its favor. If our English friends have decided that it is better never to wear evening dress in the daytime, may we not lay aside our national pride and simply imitate the English example in this particular, instead of waiting to learn through our own experience something that has been adequately demonstrated by our seniors and betters? So long as England seriously wishes to do us good in this respect, why not accept her proffered instruction in the spirit in which it is given? On the whole, we think it would be just as well in America, as in England, never to wear evening dress in the daytime.

Is a Dreyfus Case Possible in America?

For over twelve years the Dreyfus case has been the subject of general interest in all countries, and it deserves the attention it has received from the public. Not because of its fascination as a detective story, altho no novel of Conan Doyle or Anna Katherine Green equals the narrative of how this plot was woven and unraveled. Nor because of sympathy with the victim, for the condemnation of an innocent person is unfortunately not so rare in any country as to attract world-wide attention. But because the Dreyfus case affords the best possible material for the study of the workings of modern democracy in many of its characteristic manifestations. In our national spirit we are more like the French than like the English, and the Dreyfus case is full of "lessons" for us if we would avoid such a national crime.

It must be called "a national crime" because the blame of it cannot be thrown altogether upon the General Staff and the Government. The mob spirit ruled France for years, during which for any public man to express a belief in the innocence of Dreyfus was likely to involve loss of position, a business boycott, social ostracism, destruction of career or even danger to life. It was popular prejudice, the pre-judging of the people, that forced General Mercier to the first fatal error that entrained all the rest. If he had not been pushed by the hounding of the press to announce that he was certain of the guilt of Dreyfus he would not have accepted so uncritically the evidence manufactured for him by his subordinates. Having taken a stand he was obliged to carry the prosecution thru, or he would have been kicked out of office and the rest of the ministry with him. When two years later Picquart went to his superior officers with the proofs he had discovered of the insufficiency of the evidence against Dreyfus, he was flatly told that it did not matter if Dreyfus were innocent; that it was better that he should remain on Devil's Island than that

the Government should be discredited in the eyes of the world. And the officers of the General Staff forged and stole and perjured themselves to keep him chained to his fever-stricken rock in the ocean, not because they hated him, but for the honor of the army, because they were afraid of public opinion.

It was a case such as is familiar to us here, of trial by the jury of the whole, the people's court where there is no judge, where the rules of evidence do not hold, where the jury is unselected and unsworn, where the witnesses are heard only by the proxy of their advocates, the newspapers. In looking back over the case one is most struck by the contemptible figure cut by the newspapers. Of all the tons of printed paper that came from the yellow press of Paris, there was very little that contains anything but nonsense. The papers, Jewish or Jesuit, Nationalist or Socialist, are seen now to have been but puppets worked by the hands of invisible wire-pullers.

Yet it was thru the newspapers that the truth came to light. The remedy for the evils of publicity is more publicity. As soon as a facsimile of the *bordereau* appeared in *Le Matin* several persons recognized that it was in the handwriting of Esterhazy, not Dreyfus. It was thru the publication of Zola's *"J'accuse"* article that the Government was forced to show its hand. Now in this country public officials are not so sensitive to opprobrium. Jack London, David Graham Phillips and Upton Sinclair might "accuse" the authorities of all the crimes in the decalog and all that have been invented since the promulgation of that code, without having to fly to England to escape imprisonment.

Anti-Semitism, which was the mainspring of the Dreyfus persecution, has not yet reached in the United States the pitch of intensity that it has in Russia, Austria, Germany and France. But it exists as a subconscious feeling, and shows itself in many petty, spiteful ways in large cities, where the Jews form a distinct class. Prof. Goldwin Smith, who is the leading and almost the only exponent of Anti-Semitism in the English-speaking world, gave in THE INDEPENDENT a few weeks ago his theory of the causes of the feeling against the Jews. We do not in the least endorse his semi-justification of it, for we regard it as a form of race prejudice, which is one of the greatest of our national vices. We have shown by our maltreatment of the negroes and Chinese that we are no better than other nations where racial antipathies are concerned, and if in the future circumstances should cause a clash of interests the flame of race hatred might flare as fiercely as in Paris or Vienna or even Kishenef.

Two other important factors in the Dreyfus affair, the fight between Church and State, and the antagonism between the Army and the Government, are happily absent in America. The only military case in which the public has taken an active interest was the Sampson-Schley investigation. An army in a republic always occupies a somewhat anomalous position, since the manner of life, duties and code of honor of the soldier is naturally different from that of a citizen. But there is in America no such great gulf between the army and the people as in France, where the officers inherit the traditions and sentiments of the extinct monarchy. We do not know to what extent our Government follows the European system of international espionage. We hope that we keep out of the dirty business as far as possible, for its demoralizing influence is plainly shown in the Dreyfus case. It must have excited amusement or other emotions in the German Ambassador to see the scraps from his waste paper basket laboriously pieced together and published in the newspapers, and to hear the court discussing the probable meaning of his secret dispatches written in cipher to his Government, and first sent by the telegraph operator "according to the official instructions" to the French War Office to be copied for future translation before being forwarded to Berlin. And the reason why General Mercier was so zealous to punish Dreyfus in the beginning was because the press, the people and the politicians were howling at him for arbitrarily setting free a German spy, captured on the frontier. He could not explain that the man was really a French spy masquerading as a German spy.

What the world has gained thru the Dreyfus case are the examples of splendid heroism and self-sacrifice for a principle. We see the individual defying the power of military government. We see the man standing against the tyranny of the mob. There is Picquart sacrificing his career and his liberty to save an innocent man. There is Zola, gathering to his own breast, like Arnold von Winkelried, all the shafts of the enemy and falling a victim, that he might make way for liberty. There is Maitre Labori, wounded by an assassin and ostracised by his colleagues, pleading for Dreyfus before the packed tribunal of Rennes. There is Matthew Dreyfus indefatigably working at his twelve-year task of finding out first what was the evidence used against his brother, and then how to refute it. And lastly, there is Alfred Dreyfus, stoically enduring the slings and arrows of outrageous fortune and keeping up his faith in ultimate justice.

The French show in their justice the same sense of artistic symmetry that they do in their architecture. Dreyfus becomes Major in the crack regiment of Paris, and is applauded by the streets that hissed him. Picquart becomes Brigadier General, with priority over all other brigadiers. Both get the cross of the Legion of Honor, which was taken from Zola when he took up arms against the Government. Zola, dying in ignominy, is to be buried in the Pantheon. The Municipal Council of Paris names a street in honor of Zola; the Municipal Council of Mons will erect a monument to him. The Senate will put in the gallery busts of Senators Trarieux and Scheurer-Kastner, who championed Dreyfus against their own colleagues. Nothing but the Story of Esther and the Book of Job can equal the Dreyfus case in the symmetry of its ending.

The Chastity of Art

"At the twentieth year of my age I began my ambitious attempt to leave an immortal work worthy of the family."

So writes Masami Koyano, a Japanese artist, whose family from time immemorial have been engaged in metal sculpture work. For years he kept the plan in mind, and at last the day came when he could devote all his time to his ambition; for he knew the false lure of gold which spoils so many an artist. Thus he describes the danger:

"Unfortunately the architects or artists of present days, being inclined more for the earnings than for the sake of art, do not devote themselves to the ideal spirit and true course of art, and therefore they often neglect the spirit of chastity to the trade, thus failing to give us the extraordinary products that were not uncommon in older days."

There shows the true chastity of art, the lack of which, as we showed in an editorial last week, explains the failure of architects and artists of real genius.

But let us continue his story:

"Finally, after long, frequent struggles and bitter experiences, I set my heart on the construction of the 'Five Story Tower,' after that of Todaiji, and, at the sixtieth year of my age, I isolated myself by removing to a solitary country place in the midst of a wild forest in the spring of the twenty-second year of Meiji (1889) Era.

"Not only I, but all the members of the family as well, devoted themselves to the construction of the Pagoda, declining all intercourses with the outside world.

"We often had forgotten daily meals, neglected due rest, necessary sleep, kept all the necessary chastity to the ways of true architects and finally overcame all difficulties and hardships that confronted us from time to time.

"At last the work was finished in the Autumn of thirty-first year of Meiji (1898) Era, and the two images of Buddha and the stands had been completed two years later.

"Hundreds of times we were almost on the verge of being overcome by the difficulties, obstacles and hardships that seemed so mischievously to hamper us, to say nothing of our frequent negligences of our bodies; but we remembered the invaluable maxim, 'Where there is a will there is a way,' and fought the struggles out bravely, and succeeded in witnessing the final result of our blood and wealth."

Now if one wishes to see as beautiful a piece of metal work as the old artists ever fabricated, let him go to the Metropolitan Museum and study this model in gold, silver and bronze of the "Five Story Tower," or Pagoda of Todaiji, at Nara, the ancient capital of Japan. It is four and a half feet high and weighs about one hundred and fifty pounds, and is lent by Mr. E. H. Harriman, who had great difficulty in persuading the artist to part with it.

In no race, among no people, is the ideal of perfection quite prostituted to

gain. It is the custom among the large Russian Jewish families to save one child from trade and make a scholar of him. So it is that among the Jews we have the paradox of the extreme of materialism and the extreme of idealism. So we have with us those busy on high things, who, like Agassiz, have "no time to make money." They are the architects who will not build gingerbread to please a patron. They are the artists who will choose their own subjects and give infinite time and labor to paint a picture or hew a statue that will have dateless value. They are the poets who work for perfection, not for immediate cash with the next issue. They are the students who give long years of preparatory toil, and long years of immediate study, not that they may earn a weekly pittance, but that they may add something of value to the knowledge and welfare of the world. They are the idealists, forgetful of use and profit and ease, who search the pole, who cross the Dark Continent, who create empires, and then grieve that when there is so much to do there is so little time to do it in; who give their lives to reform, or civilization, or casting the searchlight of culture and religion into the long night of ignorance and wrong; the men

"Who fought, and sailed, and ruled and loved, and made our world."

Of such were Masami Koyano, and his father, Kijo Koyano, who taught him the chastity of art and began this work. And are there not many such who keep the ideal spirit, who bow no knees to Mammon, the "least erected spirit that fell from Heaven," who keep the chaste flame ever burning before the secret and sacred altar of their pure aim to do what they can worthy and true for family, country, humanity and God? May no race suicide diminish the house of Koyano!

Great and Small Powers in Arbitration

THE movement for general treaties of arbitration has come to the point where it must be steered thru the straits, between the Scylla and Charybdis of great and small Powers.

The so-called great Powers of Europe have thought highly of themselves and have had a more or less ambitious foreign policy. And it is an interesting study in national psychology to observe the relation between their extreme sensitiveness on questions of honor, their sense of self-importance, and their tendency to ignore or trample under foot the vital interests of other and smaller nations. But this latter tendency is disappearing, and this fact constitutes the chief hope of early success for the arbitration movement. Self-importance and sensitiveness on questions of honor are remnants of ambitious policies of the past, and constitute now one of the chief difficulties in going forward toward a system of international law.

This sensitiveness appears in their refusal thus far to enter into treaties of arbitration without reserving the right to go to war over questions which affect their vital interests, their honor, or their political policies; and as no man knows what a particular nation may regard as affecting its honor or vital interest the reservation practically destroys the force of the treaty. The so-called small Powers, on the other hand, are chiefly concerned to find a way of preserving their life and preserving peace among all nations so that they can prosper thru commerce. Consequently they are entering into treaties of arbitration which provide for the judicial determination of all international controversies to which they are parties.

Now the United States is like the small Powers in its foreign policy, but is regarded as one of the great Powers because of its territorial bulk and its great population. Our chief aim in foreign affairs is the preservation of peace and the enlargement of our profitable commerce thruout the world. And it was confidently expected that we would execute treaties of arbitration without number when we began the interesting work. It was a considerable shock, therefore, to the arbitration boat constructed by the Anglo-French statesmen when it ran into the United States Senate and was sunk. Many people in America were amazed, and censured rather harshly the Upper House of our Congress. Others censured the Presi-

dent. Few took the trouble to look beneath the surface and find out the real trouble so as to correct it.

The wreck of the Anglo-French treaty at Washington proved to be a blessing in disguise, however, for it revealed the defects of this treaty, and revealing these defects was the first and great step toward correcting them. It has resulted in the formulation of an arbitration treaty free from these defects, which is to come before the Interparliamentary Conference at London next week, the main features of which first made their appearance in our columns. The commission of eminent statesmen which has had it under consideration have made a report approving several of the ideas it contains, tho they are not well informed of American conditions. They have thus far failed to give their assent to one necessary point, saying that they expect American statesmen to find a way under, over or around the constitutional provision, which seems to make it impossible for us to accept their views on this point. The American delegation to the Conference of July 23d will point out to them that a clause of the United States Constitution which compels United States Senators to exercise their individual judgment on the arbitration of international disputes cannot be gotten over or under or around. They will point out also that Europe's opinion on this point will have to give way before the United States can become a party to general treaties of arbitration with the great Powers.

Until the great Powers do enter into really good and workable treaties with each other and with the United States there is no chance of substantial decrease in armaments. But we believe that a general treaty can and will be evolved to which both the great and small Powers can adhere and which will find favor with both the President and Senate of the United States, and which will make rapid progress not only possible but easy.

Colleges of Higher Rank

The Carnegie Foundation, with ten million dollars, has for its purpose to provide retiring pensions for teachers in colleges of recognized standing who have reached the proper age to retire after long service. It excludes all institutions that fall below a definite standard, and all those which have denominational limitations, and those supported and controlled by the State. Those admitted in the first report number forty-six, and an interesting list it is, for it embraces pretty much all of high rank except the State universities. The alphabetic list begins with Amherst and ends with Yale. We notice six women's colleges, Mount Holyoke, Radcliffe, Smith, Vassar, Wellesley and Wells, of which three are in Massachusetts and two in New York. There are four technological institutions, Case, at Cleveland, Massachusetts Institute of Technology, the Polytechnic Institute of Brooklyn, and the Stevens Institute of Hoboken. Only two are in Canada, Dalhousie, of Halifax, and McGill, of Montreal. Among those shut out apparently by their denominational character we notice Boston University, Wesleyan University and Vanderbilt University, all Methodist, and Chicago University, whose president must be a Baptist. But Trinity College, Hartford, is admitted, and Lawrence University, Appleton, Wis. It pays to drop all denominational restrictions, even when the control remains practically with a denomination. There are only three colleges in the old South included, Tulane University, New Orleans, on the basis of entrance requirements to be increased next year, and Johns Hopkins University and Washington University, St. Louis, if Maryland and Missouri can be called Southern States. Hardly anything else could show more clearly the educational backwardness of that section. It is remarkable how the Congregationalists predominate in the history of the founding of these forty-six institutions. We count eighteen which were thus originated and several more in which they joined with Presbyterians.

Republicans in North Carolina

It is the Republican convention in North Carolina, the same one that was addressed by Secretary Taft, before which he declared to the people of the South that their "Solid South"

had destroyed the influence of that section in the councils of the nation, which has taken action calling on the Legislature to consider the propriety of extending the force of the "grandfather clause" until 1920. It ceases to be operative in 1908, and after that, under the law, illiterates cannot vote, whatever their race, unless already registered. This action seems very strange in a Republican convention, unless it is very "Lily-white." All the illiterate whites aged one and twenty will be on the register by 1908, and this new provision is intended to favor the younger illiterates now boys who ought to be able to learn to read. It does not favor the illiterate negroes, for their ancestors could not vote before 1867, the grandfather date; so they will be shut out. North Carolina has means enough to shut out the negro in the poll-tax requirement and the white registrars, and does not need to encourage illiteracy of white youths. We observe that the Democrats have taken no action for extending the "grandfather" provision, and we trust that negroes who are betrayed by the Republicans will look elsewhere. Above all things, let them keep their right to vote by paying the poll-tax.

Alfred Beit

All that Alfred Beit is thus far famed for is the fact that he was one of the two richest men in the world. With his death the richest man in the world is an American. They say he was worth five hundred million dollars, perhaps twice as much. Perhaps after his will is read it may, as intimated, prove that he has made provision to be remembered for some great *post mortem* gifts to the public, for he was a bachelor and left no family. He made his wealth in diamond mines and gold mines. Now, diamonds are, barring some small, cutting tools, of no use to anybody. The money made out of diamond mines comes from people who can quite well afford to part with their money. It is not a business like coal mining or even gold mining, which has to do with the needs of the world, rich and poor alike; and so there need be no particular ill will attached to the business, except as far as the miners are underpaid. With Mr. Beit's immense gold mines it is a different thing, and such mines should belong to the public. Such wealth as Mr. Beit acquired is more than any one man ought to have. It gives too much power. He is said to have financed the Jameson Raid, which brought on the Boer war, and doubtless he was interested in it with Cecil Rhodes. Mr. Beit must bear a heavier weight of obloquy than any other man for the introduction of the coolies into South Africa, and for the ill treatment of the native laborers in his mines, which has now culminated in general dissatisfaction, rebellion and slaughter. Can his bequests, however great, and the million and a half he is said to have given away yearly of late, atone for the evil he has done?

An Eleven-Minute Day

There have been many estimates of the loss of time incurred in our present haphazard and competitive methods of production, and designers of utopias have promised us that under co-operative management of industries no one need labor more than six, four, or even two, hours a day. But now M. Jules Guesde, the official leader of the Socialist party of France, calculates that under a socialistic *régime* eleven minutes' labor on the part of each individual would be sufficient to provide the necessities of life. As this is as low an offer as humanity is likely to get we suggest that it be accepted before it is withdrawn, provided, of course, that said party of the first part can give sufficient bonds for the fulfillment of this proposition.

Japan in Korea

Since Viscount Ito, as Resident-General, has taken virtual control of the government of Korea, acting as adviser and dictator to the Emperor, there have been many reports of dissatisfaction there and abroad. There have been reports that the Emperor wished to escape to the protection of the American Consul; also that a clique in his *entourage* has been plotting with the Russian representative for aid from Russia against Japan; and it was reported several weeks ago from St. Petersburg that Russia is determined

to dispute the supremacy of Japan, and would denounce her to the Powers on the ground that she had exceeded her powers as granted to her by the Treaty of Portsmouth. There is no doubt that Viscount Ito holds the control with more than a velvet hand. He has put Japanese police in the Palace, and allows no one to see the Emperor without his permission. He has very lately brought on seven hundred new police from Japan. But it is not clear how Russia can complain, and no other Power is likely to do so, especially as the Japanese rule will be for the benefit of the country. In the Treaty of Portsmouth Russia "acknowledged that Japan possesses in Korea paramount political, military and economical interests," and "engaged neither to obstruct nor to interfere with the measures of guidance, protection and control which the Imperial Government of Japan might find it necessary to take in Korea." That language is strong enough. There is not much left after "guidance, protection and control" that Japan could do except annexation; as it is she is, by admission of Russia, and by consent of all the Powers which have recognized the treaty, "paramount."

The Zulu War

The terrible stories reported as to the suppression of the Zulu uprising give us fear. The British, or Colonial, army is taking no prisoners, and a report says that the "native levies" killed three thousand natives, and that troops are killing natives on sight, burning their villages and driving off their cattle. That is for terrorism and in revenge for the barbarous murder of a white man. But there are in South Africa, from the Transvaal to the Cape, 537,000 whites against 2,115,000 negroes. It is a very different condition from what we had with our American Indians, who were in all about 250,000 against our millions, while in South Africa, where the whites are strongest, the natives are nearly four to one. How will it be fifty years from now? We must take a long view of things. By that time the natives will be fairly civilized, as many of them are now, for they have their newspapers and churches already. It would be the part of prudence, if not of simple morality, to treat them fairly and gain their good will, and not plant the seeds of long revenge. Mr. Keir Hardie has lately made himself very unpopular among the reckless classes in England by defending the Zulus, and we are inclined to agree with him. It is sad to see such fighting going on under the Liberal Government; but we suppose that the matter of controlling this uprising has been left to the Colony, as was the settlement of the coolie question, and they are sure to take a very prejudiced and narrow view.

Amusing enough is the artistic proposal to put the effigies of some fifty more or less known living Pennsylvanians on the bronze doors of the new Capitol at Harrisburg. We are not surprised that one of the men, not pleased with his company, declares that he will remove his face with a file. The absurdity of it recalls the joke of a famous firm of architects in this city who arranged for statues of distinguished men of history on the front of a grand Boston building; but it was learned early enough to balk the game that the initials of the names of these distinguished men would spell, if read in order, the name of the firm.

Disturbing public meetings by violence seems to be a strange British institution sacredly cherished by all parties, and of late by women. It was a gentle and pardonable satire to call those Amazons *suffragettes* who screamed in the Parliament gallery at an unwelcome speaker, and who had afterward to be removed by force from a political meeting, but they deserve the newer designation of *fooligans*. They had a meeting of their own in a public park last Sunday, and were mobbed by the hooligans.

Many American papers have expressed indignation that *Punch* should have made fun of Mrs. Nicholas Longworth. There must be some mistake about the matter, for we have read over the article carefully and we cannot see that *Punch* has made any fun.

Insurance

The New York Life and the Mutual

LAST week the International Policy-holders' Committee, which is seeking to oust the present managements of the Mutual Life and the New York Life Insurance companies, met in this city, organized and issued an address to the policy-holders of both companies. With the exception of E. E. Clark, Bishop McCabe, Congressman Longworth and Governor Blanchard, of Louisiana, all the twenty-three members of the committee responded to the call for organization. Those present were; Governor N. B. Broward, of Florida; Rev. Dr. Russell H. Conwell, of Philadelphia; Judge George Gray, of Delaware; Governor Hanly, of Indiana; ex-Congressman Hemphill, of South Carolina; H. N. Higinbotham, of Chicago; Governor Johnson, of Minnesota; Z. A. Lash, K. C., of Toronto; F. B. Niedringhaus, of St. Louis; Samuel Newhouse, of Utah; Fremont Older, of San Francisco; ex-Secretary of State Olney, of Massachusetts; Governor Pennypacker, of Pennsylvania; ex-Judge Alton B. Parker; Governor Roberts, of Connecticut; Colonel A. M. Shook, of Tennessee; Charles Emory Smith, of Philadelphia; General B. F. Tracy, of New York, and T. B. Wanamaker, of Philadelphia.

Richard Olney was elected chairman, and a campaign committee, consisting of Judge Parker, Governor Johnson, C. E. Smith, H. N. Higinbotham, Governor Pennypacker, Governor Roberts and Colonel Shook was appointed. The address issued by the committee to the policy-holders announced that it would submit names for directors of both companies, to be voted on at the coming election, and if the policy-holders deemed it advisable they would form a permanent organization, the main purposes of which would be to safeguard the interests of the policy-holders in regard to distribution of dividends, salaries of officers, investment of bank stocks and all other activities.

In the New York Life, Messrs. George W. Perkins, James A. Blair, Norman B. Ream and H. Walters have handed in their resignations. In their places, at the regular monthly meeting of the board, were elected: Judge Horace A. Lawton, of Nashville, Tenn.; J. H. Eckels, of Chicago, ex-Controller of the Currency, and George F. Seward and Anton F. Raven, both of New York. Mr. Seward was our Minister to China from 1876 to 1880, and is the author of "Digest of Systems of Taxation of New York." He is now president of the Fidelity & Casualty Company, and vice-president of the Willson Aluminum Company. He has contributed to the magazines, including THE INDEPENDENT, many articles on economic and public topics. Mr. Raven is president of the Atlantic Mutual Insurance Company, trustee of the Atlantic Safe Deposit Company, Mutual Trust Company, and the Seamen's Bank for Savings, and director of the Fidelity & Casualty Company, the Home Life Insurance Company, the New York Fire Insurance Company, and the Mechanics National Bank.

Continental Insurance Company

THE 105th semi-annual statement of the Continental (Fire) Insurance Company (July 1st) shows assets amounting to $17,049,386 and a net surplus of $7,523,019, after including in the liabilities a reserve sufficient to meet all losses in San Francisco. Letters are published from holders of policies in that city commending the company for courteous and considerate treatment and prompt settlement of losses due to the great fire. "In these times," says one of these grateful correspondents, "when so many companies appear to be looking for excuses for delay or non-payment of their obligations, it is refreshing to find one that faces the music manfully and makes settlements promptly and cheerfully." Immediately after the fire, the Continental filed with the California Fire Insurance Department a complete list of all its policy-holders in San Francisco, in order that any one who had lost the record of his insurance could easily ascertain whether the Continental held the risk. The company also opposed the arbitrary reduction of payments in settlement which many others advocated. Settlement has been made on nearly half of its 800 San Francisco policies, and it desires to dispose of the remainder with the least possible delay.

Financial

Abundant Crops Again

In the Government's July crop report corn appears for the first time this year. Previous reports had prepared the public for a large yield of wheat. Now it is shown that the condition of the growing corn promises a crop equal to that of 1905, which was the largest ever harvested. Last year's crop was 2,707,993,540 bushels, but conditions in July had indicated only 2,651,000,000. If this year's harvest shall show a like addition to the crop now indicated (2,703,641,000 bushels), the cornfield record will be broken again. Winter wheat is safe; spring wheat is still exposed to injury, but probably the indications will be verified. If so, we shall have 30,000,000 bushels more than were harvested in 1905, and the crop will be the largest on record, that of 1901 excepted. Below is shown the measure (in bushels) of present indications, with the crops actually harvested last year:

	Indicated, July, 1906.	Harvest of 1905.
Corn	2,703,641,000	2,707,993,540
Winter wheat ...	429,534,000	428,462,834
Spring wheat ...	293,221,000	264,516,655
Total wheat	722,755,000	692,979,489
Oats	874,625,000	953,216,197
Barley	147,592,000	136,651,020

Only in oats is there a shortage, due to drought in June and to a slight reduction of the planted area. It is difficult to overestimate the importance of these great yields of the leading cereals, following yields that were also abundant. Our exports of agricultural products (including those derived from farm animals) were $890,578,000 in the year ending with last month. This was the highest record, exceeding that of the preceding year by nearly $140,000,000. Similar exports this year may not rise to those figures, but they cannot fall much below them.

A reader of The Independent calls our attention to the letter of Colonel George F. Huff to the investigating committee of the Pennsylvania Railroad directors. Colonel Huff describes at length the way in which a number of the officers of the railroad came in possession of large amounts of stock in the coal companies whose product is transported by that railroad. Colonel Huff organized these companies, beginning in 1870. Then the bituminous coal lands of Western Pennsylvania were undeveloped, and the railroad wished to develop them for its own business. Colonel Huff organized thirteen coal companies, eight of which have been consolidated in the Keystone Company. His method was to get men interested in the railroad to form a syndicate, who would give their notes for the sum of money necessary, say one-third of the cost of the land, and get those notes discounted at the bank. The syndicate would then buy the land and form a company, to which the land would be turned over in return for stock which the members of the syndicate would hold. No stock, he says, was given to Mr. W. A. Patton, whose name has been particularly mentioned, nor to any one else, without return. Mr. Patton gave his note to the bank and took the risk of failure. But it is understood that these men paid no money, and their notes were paid when due out of the bonds sold. This seems to have been a frequent kind of financiering. The chief complaint before the Interstate Commerce Commission was that these companies were favored in the distribution of cars. Certain employees later received actual gifts of stock in coal companies, and were said to give favors in return. President Cassatt has issued an order that all officers of the railroad shall immediately divest themselves of all coal and other stock, the possession of which might affect their service to the railroad or the public.

....The Guaranty Trust Company, of which John W. Castles is president and Oscar L. Gubelman vice-president, and whose capital is $2,000,000 and surplus $5,500,000, had deposits on June 30th of $41,242,387.26. The total resources amount to $49,590,874.66.

....Dividends announced:

Am. Graphophone Co., (Preferred, quarterly), 1¾%, payable Aug. 15.

Louisville & Nashville R. R. (Semi-annual) 5%, payable Aug. 10.

The Independent

VOL. LXI NEW YORK, THURSDAY, JULY 26, 1906 No. 3008

Survey of the World

Organized Labor in Politics

A campaign address was issued last week by the Executive Council of the American Federation of Labor. Several Presidents of the United States, it says, have urged the passage of equitable legislation in behalf of the working people, "but Congress has been entirely preoccupied looking after the interests of vast corporations and predatory wealth." Senators and Representatives, "in their frenzied rush after the almighty dollar, have been indifferent or hostile to the rights of man." Reference is made to the presentation of "a bill of grievances," on March 21st, to President Roosevelt and those responsible for legislation in Congress. "But if perchance you may not heed us," said the representatives of organized labor at that time, "we shall appeal to the conscience and support of our fellow citizens":

"The relief asked for has not been granted. Congress has turned a deaf ear to the voices of the masses of our people; and, true to our declaration, we now appeal to the working people; aye, to all the American people unitedly, to demonstrate their determination that this Republic of ours shall continue to be of, for, and by the people, rather than of, for, and by the almighty dollar."

It is recommended that central bodies and local unions elect delegates to meet in convention for the formulation of plans to further the movement and to nominate candidates who will stand for the enactment of labor measures. "The first concern of all should be the positive defeat of those who have been hostile or indifferent to the just demands of labor." Straight labor candidates should be nominated "where both parties ignore labor's legislative demands," but legislators who have been friends of labor should be supported for re-election. The movement "must not degenerate into a scramble for office," and should be free from partisanship:

"The utmost care should be taken to nominate only such union men whose known intelligence, honesty and faithfulness are conspicuous. They should be nominated as straight labor representatives, and stand and be supported as such by union men and their friends and sympathisers, irrespective of previous political affiliation. Wherever it is apparent that an entirely independent candidate cannot be elected, efforts should be made to secure such support by the minority party and by such other progressive elements as will insure the election of labor representatives."

Pointing to the recent election of fifty-four trades unionists to the British Parliament, the address says: "If the British workmen with their limited franchise accomplished so much by their united action, what may we in the United States not do, with universal suffrage?" Gains already made by the workers, the address goes on to say, have been the result of their organization, intelligence and sacrifices; they have not been due to kindness or consideration at the hands of the powers that be, but have been achieved in spite of the combined bitter hostility of mendacious greed, corporate corruption, legislative antagonism and judicial usurpation. "Labor demands a distinctive and larger share in the governmental affairs of our country; it demands justice; it will be satisfied with nothing less."

A Labor Platform

Before this address was issued there had been reported for consideration in the Central Federated Union, of New York, a plan of campaign and a long platform. The latter demands the enforcement of the

laws relating to child labor, compulsory education, the eight-hour day, the prevailing rate of wages, contract labor in prisons, and the sanitary inspection of mines, tunnels, workshops and dwellings. It also demands the enactment of laws, State or National, providing for postal savings banks; a postal express; ownership and operation by municipalities, the State or the nation, of all public utilities; municipal ice plants; municipal abattoirs; ballot reform; direct legislation thru the initiative and referendum; abolition of the Electoral College, and direct nomination and election of President, Vice President, United States Senators, judges and all elective officers; and the prohibition of the use of injunctions in labor disputes. Commenting upon this last clause at a meeting of the Union, Mr. Gompers said he thought it was too sweeping. "What we have to fear is not the courts' power to use injunctions, but the perversion of that power." "The engineer-general of the machine now running in Congress, genial Uncle Joe," he added, "has more deviltry in his nature toward organized labor than any other man I know of." Speaker Cannon is one of those whose re-election the unions will try to prevent. It is understood that others to be opposed are a majority of the Republican members of the House Judiciary Committee and all the Republican members of the House Labor Committee except one. Prominent among these are Messrs. Bartholdt and McCall. A determined effort will be made to defeat Mr. Littlefield in Maine, where Speaker Cannon and other well known Republicans will contend against Mr. Gompers and his associates in the campaign.

Enforcing the Eight-Hour Law

At the instance of Secretary Taft, President Roosevelt has given orders that all Federal officers and inspectors in charge of public works shall detect and report violations of the law of 1892, which requires an eight-hour day for all laborers and mechanics employed by the Government or by a contractor upon "any of the public works of the United States." Heretofore, such officers have not done this. When complaint was made by labor unions, they have said that the unions should proceed legally against offenders. The unions have replied that it was almost impossible for them to obtain the necessary evidence, and that they had no funds for legal contests. Violations of the law must hereafter be reported promptly to the Department of Justice. When the Federation of Labor asserted, some time ago, that the law was being violated, Mr. Roosevelt called for specifications. They were given, and an investigation by Commissioner Neill showed that the complaints had been well founded. Some difficulties will be encountered in enforcing the statute, owing to differences of opinion as to whether certain projects under private contract, such as naval vessels, are "public works."

Ice Trusts and Other Combinations

In many cities prosecutors are still pursuing ice companies and their officers. Owing to the exactions of combined producers, several municipalities are about to take up the business of making and selling ice. The Mayor of Mt. Vernon, N. Y., has awarded a contract for an ice factory which is to have a capacity of 50 tons a day and be ready for use three months hence. The Mayor of Detroit proposes that his city shall supply ice to consumers at a price slightly exceeding the cost of cutting, storage and delivery. He would have the winter work done by the men employed by the Park Commission, as they have little to do at that season. Mayor Coyne, of Yonkers, N. Y., would have ice cut from the city's reservoirs and sold at cost. Grand juries in Boston and Indianapolis are taking testimony about ice combinations in those cities. Cleveland's indicted ice dealers are soon to be tried. In St. Louis the prosecuting attorney has sued two companies, asking for a fine of $100 a day for 714 days and for the annulment of their charters. The prosecutor in Philadelphia says he has evidence enough to convict the thirteen ice dealers arrested there. In Jacksonville the arrested dealers have been tried for criminal intent to defraud and have been acquitted, altho it was shown that only one of the six ice factories was in operation, that all the ice from this factory was sold to one company at $2.60 per ton, and that this company sold

to consumers at prices ranging between $6 and $18. There was testimony tending to prove that ice could be made there and sold profitably at wholesale for $1.50 per ton. The ice men sent to jail by Judge Kincaid in Toledo have been released by a higher court, pending a hearing on appeal some months hence. Judge Kincaid sent three of their lawyers to jail for contempt; the higher court has set them free. In Cincinnati five ice companies and eleven of their officers have been indicted.——To avoid prosecution, the Sewer Pipe Association or Trust, a combination of seventeen companies capitalized at $10,000,000 and controlling the manufacture and sale of sewer pipe, has offered to dissolve. This offer was accepted on the 19th, at Jamestown, N. Y., where the district attorney was about to lay before a grand jury a mass of evidence against the combination.——In Arkansas the Attorney General has sued five cottonseed oil mills under the Anti-Trust law, asking for a fine of $5,000 a day. He will proceed against thirty-four more mills that are in the combination. ——John D. Rockefeller sailed for this country on the 20th. Three days later his attorney entered his appearance at the court in Findlay, Ohio, where he is charged with violating the Anti-Trust law. Mr. Rockefeller is therefore bound to appear for trial in September, and it is said that he will go to Findlay at that time.

Movement Against Americans in Mexico

Many Americans have left Mexico, where it is expected that Americans will be in danger on or before September 16th, the date said to have been chosen for an attack upon them. Trainloads of these refugees are passing thru El Paso. In the large cities of Northern Mexico circulars warning all foreigners to leave the country have been posted and distributed. The text of these circulars is as follows:

"We desire Mexico for Mexicans and warn all foreigners that if they do not leave the country by the 16th of September they will be driven into the sea. Our nation, hitherto independent, is being made the servant of foreign capital. We are on the borders of an abyss, and a great catastrophe menaces us unless we force all foreigners out of the country and give our own people a chance."

The movement is strongest in the northern States, especially in Chihuahua and Sonora, where the influence of Americans and American capital is said to have led some natives to fear that this part of their country will follow Texas. One of a party of fifty American refugees passing thru New Orleans last week explained that the men had come away reluctantly, having yielded to the entreaties of their wives, who had discovered that their Mexican servants were heartily in sympathy with the anti-American movement. As the army had been recruited from the lower classes, who had been misled by agitators and agents of revolutionary societies, he felt that it could not be relied upon for protection. Some expect a great labor strike on September 16th, Mexican workmen resenting the refusal of railroad companies and other employers to pay them as much as they pay to Americans. Enemies of the Diaz administration are said to be using the movement for political purposes. President Diaz says to American residents that they will be protected, and that "a few executions of the leaders will put an end to any persecutions by Mexicans." Many Americans have come from outlying parts of the country to the capital for safety.

Philippine Postal Savings Banks

Under a recent act of the Philippine Commission, postal savings banks are at once to be established in the islands, beginning in Manila, Iloilo and Cebu. There will be three classes of banks. In those of the first class deposits and withdrawals will not be limited; in those of the remaining two classes there will be a limit as to the amount deposited or withdrawn at one time and as to the sum received in one month. In those of the third class the deposits must be in savings-bank stamps, which are sold in denominations of 5, 10 and 20 centavos, with cards on which they may be pasted. At first the rate of interest will be 2½ per cent., but it will be paid on only 1,000 pesos. For charitable and benevolent institutions, however, the line will be drawn at 2,000. Deposits are to be invested under the direction of a special board of five persons, a majority of whom will be heads of the Government

departments. They will be exempt from taxation. A depositor must be at least six years old.——Owing mainly to the diplomacy of Harry Bandholtz (formerly an infantry captain and now Assistant Chief of the Constabulary), several prominent ladrones or outlaws have been induced to surrender and are now in custody at Manila. Among these prisoners are Macario Sakay and Francisco Carreon, the self-styled President and Vice-President of the "Filipino Republic," Lieutenant-General Villafuerte and Generals Montalon, Devega and Natividad, all of whom have infested the provinces of Rizal and Laguna in Luzon. No promise was given, except that they should have a fair trial. Bandholtz was greatly aided by Dominador Gomez, formerly president of the Nationalist party and of the Philippine Labor Union, a physician of mixed blood who fought on the side of the Spaniards in Cuba, and has exerted much influence in the islands since 1902. Peace is expected now thruout Luzon, altho Salvador and his fanatics are still to be reckoned with. In Cebu Governor Osmena has secured the surrender of all the outlaws who have been at large. In the island of Leyte, on the other hand, the Pulajanes are very aggressive. On the 22d a detachment of constabulary encountered 600 of them, near Buraen, and were driven back, losing twelve privates, a scout and Lieutenant Worswick, of Kansas.——To meet the demand for surveyors the Commission has provided for the instruction (and also the employment) of a large number of native students for a term of five years. It is very difficult to obtain surveyors or civil engineers from the States.——As some of the Igorrotes now on exhibition in this country have not been well treated, the War Department has decided that all of them shall be sent back to their homes in the islands.

End of the War in Central America

Owing to the friendly influence of President Roosevelt and President Diaz there is peace now in Central America. Their good offices were accepted on the 16th, but there was sharp fighting between Guatemala and Salvador almost up to the morning of the 18th, when, at six o'clock, an armistice was declared. The last two battles of this brief war were at Metapan and Planatar, on the 16th and 17th, and they were attended with much loss of life. Among those slain on the side of Salvador was Colonel Adalberto Guirola, a graduate of West Point, and the son of a millionaire. Salvador asserts that her forces were victorious; Guatemala says they were not. Some reports say that there had never been harder fighting or more bloody contests in Central America. Peace commissioners representing Guatemala and Salvador (and Honduras, her ally) went on board the American cruiser "Marblehead" and were carried out beyond the three-mile limit. American and Mexican Ministers were at hand to give counsel and exert a pacifying influence. American naval vessels have been used for such purposes several times during the last ten years off the coasts of Central America or Santo Domingo. On the 20th an agreement was reached and signed by Guatemala, Salvador and Honduras. It also had the moral sanction of Costa Rica and Nicaragua. This agreement provides for the establishment of peace, the withdrawal of armies within three days, an exchange of prisoners, the negotiation (within two months) of a treaty of friendship, commerce and navigation, and the reference of future differences to the President of the United States and the President of Mexico for arbitration. It is expected that this last clause will prevent war in Central America for many years to come. It is recalled by some that Señor Pacas, one of Salvador's Peace Commissioners, represented Salvador at Washington, four years ago, in arbitration proceedings concerning the claim of an American company, and publicly denounced his fellow arbitrators (the Chief Justice of Canada and Mr. Don M. Dickinson) for bias and unfairness because the decision was against his Government. It is fortunate that peace was restored before the assembling at Rio of the Pan-American Conference, to which both Guatemala and Salvador have sent representatives. Guatemala's

revolutionists say they will continue their efforts to overthrow the Cabrera Government.

Arrests in the Isle of Pines

Some excitement has been caused in the Isle of Pines by the arrest and imprisonment of three American residents. It appears that a telegraph line about 1,000 feet long was constructed by L. C. Giltner, postmaster at Columbia; William Augustine and Miss Millie Brown. It connected Giltner's store with the residences of the two other persons interested. All three were arrested for violating a military order (first issued when Cuba was held by our army) forbidding the maintenance of any telegraph lines except those owned by the Government. Having been tried and found guilty, they were sentenced to pay a fine of $100 or be imprisoned for thirty-three days. They refused to pay, and were taken to the jail in Nueva Gerona, where there is no suitable provision for women. Miss Brown is eighteen years old. The defendants say that they had made only a toy telegraph line simply for their own instruction and amusement; also, that they were arrested without warning. On the other hand, the Cuban Government has received an official report asserting that the defendants had given notice in the newspapers that the line was open for messages, and that they deliberately and defiantly maintained the line after receiving warning that they were breaking the law. In deference to the feelings of American settlers, orders were given for the removal of Miss Brown from the jail to the residence of the Mayor. The attempts of American settlers to set up a government of their own and prevent a final cession of the island to Cuba have been sharply resented by the native inhabitants.

The Pan-American Congress

A crowd of fully 20,000 persons filled and surrounded the St. Louis pavilion when the third Pan-American Congress was opened at Rio de Janeiro this week, Monday, at 8 p. m. The warships in the harbor threw their searchlights on the building, and the entire city of Rio de Janeiro was bedecked in gala attire. Señor Joaquin Nabuco, the Ambassador of Brazil to the United States, was chosen the permanent president of the Congress, after Baron Di Rio Banco, Brazilian Minister of Foreign Affairs, in a speech opening the Congress, congratulated President Roosevelt and President Diaz, of Mexico, who this week have brought about peace in Central America. But when Señor Jaurejas, of Guatemala, and Señor Davla, of Honduras, and Señor Delgao, of Salvador, shook hands the applause was deafening, and the Congress forthwith adopted a vote of thanks to President Roosevelt and President Diaz. It is expected that the most important question discussed at the Congress will be the Drago doctrine. Reduced to its simplest terms, this doctrine is a declaration that no nation can forcibly collect debts owing to its citizens by any other nation. It is hoped that this Drago doctrine will be referred by the Pan-American Congress to The Hague Tribunal for adjudication as to its status in international law. It is a doctrine that vitally affects the interest of every debtor nation.

The Inter-Parliamentary Conference

The fourteenth meeting of the Inter-Parliamentary Conference met in the Royal Gallery of the Palace of Westminster, London, on July 23rd. It was attended by between five hundred and six hundred delegates, representing twenty-one different national legislative bodies. The opening address was made by Lord Weardale, formerly Sir Philip Stanhope. He welcomed with special cordiality the appearance in the Conference of representatives of Russia's first parliament. The British Premier, Sir Henry Campbell-Bannerman, in his response gave a tribute to the Czar for the establishment of The Hague Conference, and, in alluding to the Duma, said that, altho it was dead, yet it would rise again. The remark was greeted with great applause, and when Sir Henry shouted, *"La Duma est morte! Vive la Duma!"* the delegates rose to their feet and cheered for two minutes. Professor Kovalevsky rose to speak for the Duma, and in a voice broken by emotion announced that the

Duma delegation must withdraw from the Conference and return to take fight in the battle for liberty at home.

"We came here in behalf of the Russian nation to partake in the great work of the conference. The Russian people desire peace. The mission of the Russian Parliament was to snatch a great people from a *régime* of violence and substitute for it a sense of reality, liberty and justice. We hoped to take an active part in your work, but our mission comes to a sudden end, as our Parliament having been dissolved, we are no longer official representatives. Our sympathy remains. We return home with the determination to continue the great struggle for freedom, liberty and justice.

Amid cries of "No! No!" the Russian delegates left the hall. The Conservative newspapers severely criticised the speech of the Premier as a violation of international courtesy, an interference with the internal affairs of a foreign country by the official head of the Government. The first proposition taken up by the Conference was that for the conversion of the next Hague Conference into a permanent International Parliamentary body as proposed by Congressman Bartholdt. William J. Bryan wished to take immediate action to prevent bombardment for the collection of debts, as has been done recently in Venezuela and San Domingo, embodying his idea in the following resolutions:

"If a disagreement should occur between contracting parties, which in the terms of the proposed arbitration treaty, need not be submitted to arbitration, they shall, before declaring war or engaging in any hostilities whatever, submit the question to the Hague Court or some other impartial international tribunal for investigation and report, each party reserving the right to act independently afterward."

John Sharp Williams and other American delegates are working in favor of this action. The Conference adopted the following resolution in regard to extending power and influence of The Hague Conference:

"First—That it would be advantageous to give The Hague Conference a more permanent influence in the organized functions of diplomacy, and that the powers should agree in establishing periodical meetings of the conference.

"Second—That in naming their representatives to the second Hague Conference, the powers may usefully give them instructions to ascertain the best means of constituting a consultative commission charged with the duty of preparing the codification and development of international law."

After the consideration of the terms of the model treaty of arbitration, the Conference will devote itself to the questions to be brought before The Hague, such as the rise and duties of neutrals, the inviolability of private property at sea in time of war, and the use of new weapons. King Edward sent his greetings and good wishes to the Conference, and extended to them an invitation to visit him at Windsor Castle.

A Sunday Law in France

For many years the labor unions and the Clericals, in spite of their antagonism on other grounds, have worked together to secure a compulsory weekly day of rest, and their efforts are at last crowned with success. The bill was prepared in the Senate and passed the Chamber of Deputies by a vote of 575 to 1. The chief opposition was on the ground that it interfered with the running of many institutions which the public demand should be kept open on Sunday. Some violent Anti-Clericals objected that the fixing of Sunday as the day of rest was a return to the old union of Church and State, but it was generally agreed that apart from any religious sanction of the day it was the most convenient to the people as a whole. The law was made a part of the general program of the present Government for the improvement of the condition of the working classes and will be followed by measures for a graduated income tax and an old-age pension system. As the law may be used as a model for legislation on the subject in other countries its main provisions are of interest. No industrial or commercial establishment of any kind, whether public or private, lay or religious, even of those for education or benevolence, is permitted to work an employee more than six days a week. The weekly period of rest should be twenty-four consecutive hours. It should be on Sunday. Wherever the complete closing of an establishment on Sunday would be prejudicial to the interests of the public, the weekly rest may be given for part or all of the year in one of the following ways: (1) on some other day of the week for the whole per-

sonnel of the establishment, (2) from Sunday noon to Monday noon, (3) Sunday afternoon with a compensatory holiday by rotation every fortnight, or (4) by shifts in rotation of part or all the employees. These exceptions can only be made by direct authorization of the Government. The day of rest by rotation (4) is permitted only to the following establishments: hotels and restaurants; shops for sale of tobacco and fresh flowers; hospitals, asylums and drug stores; baths; newspapers, museums, theaters and libraries; water-works, gas-works and power plants; transportation other than railroads; and industries dealing with perishable material or products. In the case of public works of an urgent nature, such as the prevention or repair of accidents, the weekly day of rest may be suspended for the workman needed. Railroads and steamships are provided for in another law.

The Dissolution of the Duma

The Czar, under the advice of such reactionaries as General Trepoff, Count Ignateiff and Mr. Pobiedonostzeff, ex-Procurator of the Holy Synod, decided upon an aggressive move against the Liberal forces and on July 21st dismissed the Duma. Another Duma will be convoked on March 5th, 1907. The time and mode of election will be determined later. From a technical point of view the time of dissolution seems to have been well chosen, for it has taken both the members of the Duma and the revolutionists by surprise. For some time members of the Duma had been encouraged to believe that the Government was about to adopt the conciliatory policy and that a new cabinet would be chosen from among the leaders of the Constitutional Democrats. During the session of the Duma only one bill has been passed which received the sanction of the Council of the Empire and the signature of the Czar, that is the appropriation of 15,000,000 rubles from treasury funds for the relief of the famine sufferers. The Council of the Empire agreed with the Duma in refusing to accede to the wishes of the Government and authorize a loan of 50,000,000 rubles for the peasantry, and accepted the Duma's proposal to draw the money from the existing revenues and expend it under the supervision of the Duma. Another excuse for the dismissal of the Duma was the public address issued by that body explaining its position upon the agrarian question. In its original form, as presented by the Group of Toil, this was a very revolutionary document, but it was feared by the more conservative element that this would simply be provocative to the Government, so after a stormy debate, in which the divergence in view of the radical and the conservative factions became more apparent than ever before, it was passed in an amended form and much subdued in tone. In dismissing the Duma, the Czar issued a manifesto expressing his disappointment with its work and making promises to the peasants in the following terms:

"A cruel disappointment has befallen our expectations. The representatives of the nation, instead of applying themselves to the work of productive legislation, strayed into a sphere beyond their competence and have been making comments on the imperfections of the fundamental laws, which can only be modified by our imperial will. In short, the representatives of the nation have undertaken really illegal acts, such as an appeal to the nation by Parliament.

"The peasants, disturbed by such anomalies, seeing no hope for the amelioration of their lot, resorted in a number of districts to open pillage, destruction of other people's property, and disobedience of law. But our subjects ought to remember that improvement in the lot of the people is only possible under conditions of perfect order and tranquillity. We shall not allow arbitrary, illegal acts and shall impose our imperial will on the disobedient by all the force of the power of the State.

"We call on well-disposed Russians to unite for the maintenance of legal power and the restoration of peace to our dear fatherland. May calm be re-established in the Russian land. May God help us realize the chiefest of our tasks, that of reform of the lot of the peasants. Our will on this point is unshakable, and Russian husbandmen, without other people's property being encroached upon, will be supplied, in cases where the peasants' lands are too small, with legal and honest means for the enlargement of their property. Representatives of other classes will, at our request, devote all efforts to the realization of this great task, which will be performed definitely in a legislative manner by a future Parliament."

The preparations of the Government had been carefully made, and, simulta-

neously with the ukase of dismissal, was issued another declaring the city of St. Petersburg in "a state of extraordinary security," which is a form of martial law, altho not quite so stringent and arbitrary as "the state of siege." The Goremykin Ministry was dismissed and Minister of the Interior Stolypin has been made Premier. Mr. Stolypin is regarded as an efficient, just and incorruptible man, not an extreme reactionary, but opposed to all lawlessness and revolutionary movements. The capital has been filled with the most loyal of the troops, the radical newspapers suppressed and hundreds of arrests made in the night, and the Tauride Palace, in which the Duma has been meeting, was closed and occupied by guards.

The Duma Defiant

At once upon their dismissal over two hundred of the members of the Duma went to Viborg, Finland, and held an all-night session in the dining-room of the Belvidere Hotel, in spite of the threat of Governor Rechanberg to disperse them by force of arms. Several plans of action were proposed. The radical members wanted the Duma to declare itself the real Government of Russia and remain in perpetual session, but finally a compromise was effected and embodied in the manifesto printed in full below, advising a policy of "passive resistance" on the part of the people. Even the most conservative members of the Duma, such as Count Heyden, took part in the Viborg session of the Duma, altho the Count and the Polish delegation did not sign the appeal to the people. President Muromtseff, Ivan Petrunkevitch and most of the Constitutional Democrats returned to St. Petersburg, but the Socialists remained in Finland to avoid arrest. Since the Duma is dissolved they are no longer immune from arrest. The Government is making every effort to prevent the publication of the appeal. A general strike and agrarian riots are in prospect, but whether a definite and effective revolutionary movement can be organized is doubtful. A permanent executive committee of the Duma was elected at the Viborg meeting, which may in the course of events become a provisional government. Prince Paul Dolgorukoff is the president of it, but the names of the other members are not given out. The secret presses of the revolutionary organizations are printing the Duma's address to the people.

"To the People from their Popular Representatives:

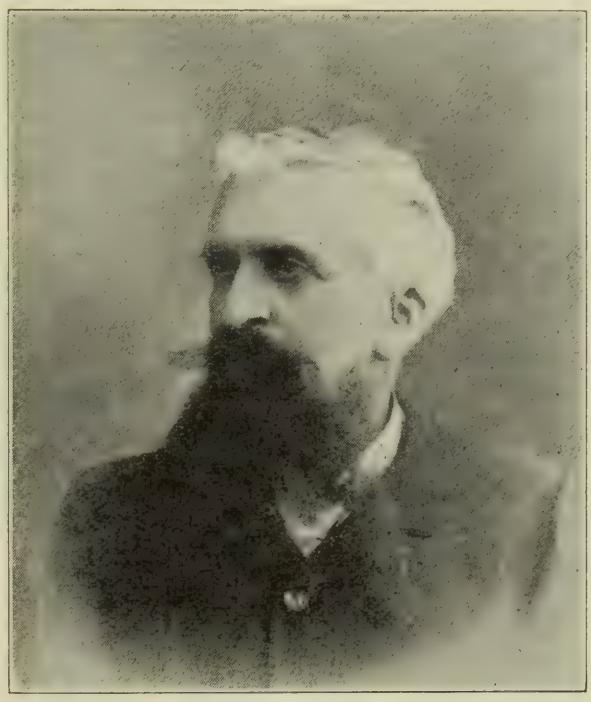
"Citizens of All Russia: Parliament has been dissolved by ukase of July 21. You elected us as your representatives and instructed us to fight for our country and freedom. In execution of your instructions and our duty, we drew up laws in order to insure freedom to the people. We demanded the removal of irresponsible Ministers, who were infringing the laws with impunity and oppressing freedom. First of all, however, we wanted to bring out a law respecting the distribution of land to working peasants and involving the assignment, to this end, of Crown appanages, monasteries and lands belonging to the clergy, and compulsory expropriation of private estates.

"The Government held such a law to be inadmissible, and upon Parliament once more urgently putting forward its resolution regarding compulsory expropriation, Parliament was dissolved.

"The Government promises to convoke a new Parliament seven months hence. Russia must remain without popular representation for seven whole months, at a time when the people are standing on the brink of ruin, and industry and commerce are undermined, when the whole country is seething with unrest, and when the Ministry has definitely shown its incapacity to do justice to popular needs. For seven months the Government will act arbitrarily and will fight against the popular movement, in order to obtain a pliable, subservient Parliament. Should it succeed, however, in completely suppressing the popular movement, the Government will convoke no Parliament at all.

"Citizens, stand up for your trampled-on rights, for popular representation, and for an imperial Parliament. Russia must not remain a day without popular representation. You possess the means of acquiring it. The Government has, without the assent of the popular representatives, no right to collect taxes from the people nor to summon the people to military service. Therefore you are now the Government. The dissolved Parliament was justified in giving neither money nor soldiers. Should the Government, however, contract loans in order to procure funds, such loans will be invalid. Without the consent of the popular representatives the Russian people will never acknowledge them and will not be called upon to pay them.

"Accordingly, until a popular representative Parliament is summoned, do not give a kopeck to the throne or a soldier to the army. Be steadfast in your refusal. No power can resist the united, inflexible will of the people.



"Citizens, in this obligatory and unavoidable struggle your representatives will be with you."

The Decay of Matter

BY DR. GUSTAVE LE BON

[The author of the following article is one of the most many-sided scientists of France. He has done notable work as a physician, ethnologist, sociologist, historian, philosopher, physicist and metaphysician. His cosy Paris home, filled to overflowing with curios collected by himself, bespeaks several of these activities and reveals the widely-traveled student. Dr. Le Bon has, indeed, visited India, North Africa, Egypt, Assyria and Judea, and has published a half dozen volumes on what he has seen and learned in those various countries. In quite another field are his two best known books, perhaps, viz.: "The Psychology of Crowds" and "The Psychology of Socialism," which bring out his remarkable abilities as a thinker and writer, and are excellent examples of his experimental method. His latest book, which has attracted very wide attention, is "The Evolution of Matter," of which the following article is a sort of *résumé*. We comment on this editorially.—EDITOR.]

PRINCESS PALATINE, who tried to forget her political disappointments by studying philosophy, wrote one day to Descartes and asked him to explain to her in a letter the mechanism of the relationship between soul and body. It was, of course, necessary that the letter be not too long and that it be, at the same time, clear. The philosopher was able very easily to meet the first condition, but it was not the same in regard to the second. This was only too evident from the obscurity which characterized his reply. The embarrassment which I have experienced in the preparation of this article resembles that of Descartes on the occasion just referred to. I am asked to crowd into a few columns of a periodical an account of the studies made concerning the evolution of matter which I originally developed in a big volume of some four hundred pages. All I can do under the circumstances is to point out the results of my investigations, without entering into any details as to the way in which the conclusions were arrived at.

Gustave Le Bon.

In the first place, I must call attention, in a few words, to the ideas which prevailed scarcely ten years ago concerning the permanence of matter, even tho transformation may occur. The indestructibility of matter is one of the small number of dogmas which modern science has accepted from ancient science without modification. From the time of the great Roman poet Lucretius, who made it the fundamental element of his philosophical system, down to the days of the immortal Lavoisier, who planted it on a base that was considered eternal, this sacred dogma had never been weakened and nobody dreamed of calling it into question.

Matter itself appeared to be inert, and to give it animation some outside force was necessary. Modern science considered this force to be a transformation of a grand entity, energy, to which had been given the attribute of immortality; so that while everything else in the universe was condemned to perish, two elements alone, matter and energy, escaped this fatal law. Tho undergoing ceaseless transformation, they remained indestructible and consequently immortal. But the facts brought out by my researches and the results springing there-

from prove, on the contrary, that matter is not eternal and can vanish without return. They establish, furthermore, that the atom is a reservoir of an energy never before suspected, tho it surpasses in its might all the forces with which we are acquainted and is perhaps the origin of most of them — especially electricity and solar heat. In fine, they reveal the fact that between the ponderable and the imponderable, which up to the present have been considered as separated absolutely, lies an intermediate world. And these researches have led me to formulate the following principles, to the demonstration of which my book, "The Evolution of Matter," is devoted:

1. Matter, which was formerly supposed indestructible, gradually diminishes by the continual dissociation of the atoms which compose it.

2. The products of the dematerilization of matter constitute by their properties substances which are intermediary between ponderable bodies and the imponderable ether—that is to say, between the two worlds which science has heretofore considered as widely apart as the poles.

3. Matter, heretofore looked upon as inert and unable to give out more energy than had been communicated to it, is, on the contrary, an immense reservoir of energy, intra-atomic energy, which it can spend without borrowing anything from without.

4. It is from this intra-atomic energy, which manifests itself during the dissociation of matter, that spring most of the forces of the universe, especially electricity and solar heat.

5. Force and matter are two different forms of the same thing; matter represents a stable form of intra-atomic energy, while heat, light, electricity, etc., represent unstable forms of the same energy.

6. By dissociating the atoms—that is to say, by dematerializing matter, the stable form of energy called matter is simply transformed into its unstable forms known under the names of electricity, light, heat, etc. Matter, therefore, is being continually transformed into energy.

7. The law of evolution, applicable to living beings, is also applicable to simple bodies—chemical species are no more invariable than living species.

Very numerous are the facts which go to prove that the atom is susceptible of a dissociation apt to lead to forms where it loses all its material qualities before disappearing in the ether. Among the most important of these should be noted the emission by all bodies of particles animated by a tremendous velocity, capable of rendering air a conductor of electricity, of traversing obstacles and of being divided by a magnetic field. No known force being capable of producing such effects, and especially this emission of particles whose velocity approaches that of light, it was evident that we were in the presence of phenomena of which we were completely ignorant. Several theories were advanced for their explanation, only one of which—that of the dissociation of atoms, which I formulated at the origin of these researches—has resisted all criticism; and for this reason it is almost universally accepted today by the scientific world.

A small number of bodies, such as radium, uranium, etc., possess the property of very rapid dissociation, and this it was that lead to the discovery of this phenomenon. But all bodies possess in a feeble degree this same characteristic which the radio-active substances possess to such a high degree; and this can be increased thru the influence of certain agencies, such as light, chemical reactions, etc. The dissociation of matter is therefore a general law, which may be formulated as follows: Under diverse influences, of light, chemical reactions, electrical action, and often even spontaneously, the atoms of simple and compound bodies are dissociated and emit effluvia belonging to the family of cathodic rays. We do not yet know all the products of the dissociation of matter, but so far the following have been established: Emanations, positive and negative ions, electrons, cathodic rays and X rays. By their properties they form intermediaries between matter and ether. Whether they be engendered by the cathode of Crookes's tube, by the radiation of a metal under the action of light or by the radiation of spontaneously radio-active bodies, such as uranium, thorium, radium, etc., the products of the

dissociation of matter are of the same nature; they undergo the same magnetic deviation and the ratio between their charge and their mass is the same. Their velocity alone varies and this velocity is always very great.

The products of the dematerialization of matter are especially recognized by their properties of rendering air a conductor of electricity and of being deviated by an electric field. The last of these characteristics has made it possible to measure their velocity. It may cause astonishment to declare that it is possible to measure the velocity of particles which travel at the rate of some sixty thousand miles per second. But this is easily done. A narrow pencil of rays emanating from a very radio-active body is thrown on a phosphorescent screen, where it produces a spot of light. This pencil of electrified particles can be deviated by an electric field, can be deflected by means of a magnet placed in such a way that its line of force is at right angles to the direction of the particles. The change of place of the luminous spot on the phosphorescent screen marks the deviation of the particles caused by a magnetic field whose intensity is known. The force necessary to deviate to a certain degree the projection of a known mass, making it possible to determine the velocity of the latter, it is evident that from the deviation of the cathodic particles it is possible to estimate the velocity. It is a little less than one-tenth of the velocity of light, or about 18,000 miles per second, and sometimes attains nine-tenths of the velocity of light. When the pencil of rays contains particles of different velocity they trace a line, more or less long, on the phosphorescent screen, instead of producing a single point, and thus the velocity of each one of these rays may be computed.

We may, then, declare that if matter cannot be created it can at least be destroyed without any possibility of return. For the old scientific adage, Nothing is created, nothing is lost, must now be substituted, Nothing is created, but all is lost. If we burn a body or try to destroy its elements by any other means, these elements are simply transformed and are not lost, because the scales show that the weight of the body has not changed. But the elements of the atoms which are dissociated are, on the contrary, irrevocably destroyed. They have lost all the characteristics of matter, including the most fundamental of all, weight. The scales no longer give any sign of their existence. Nothing can bring them back to a material state. They have vanished into the immensity of the ether which fills space, and no more form a part of the universe.

Whence does matter draw the enormous amount of energy required to project into space particles, dissociated from itself, with a velocity that can exceed sixty thousand miles per second? This projective force is tremendous. To transmit to a Lebel rifle ball a like velocity it would be necessary to have an arm that could hold 1,340,000 barrels of powder, each weighing over one hundred pounds!

This problem puzzled physicists until I showed that this energy was in matter itself and not outside of it. Matter is, in fact, an immense reservoir of energy composed of a body of imponderable elements held in equilibrium by the rotations, attractions and repulsions of the parts with which it is made up. From this equilibrium spring the material properties of bodies, such as weight, form and apparent unchangeability.

This conception of matter leads us to consider it to be a variety of energy. To those forms of energy already known—heat, light, etc.—must now be added that of intra-atomic matter or energy. It is characterized by its colossal powers and the largeness of the amount in proportion to the smallness of the volume.

It follows from the preceding statements that by dissociating atoms we simply give to the variety of energy called matter a different form, such as electricity or light, for example. But in what forms can intra-atomic energy exist? How can such immense force be concentrated in such very small particles? At first sight the idea of such a concentration of force seems to stagger us, because we are always accustomed to associate greatness of mechanical power with the dimensions of the apparatus which produces this power. Thus a machine of a thousand horse power has a certain bigness. This comes from the principle of the association of ideas, and

produces a false conception due to the inferiority of our mechanical systems. A simple calculation shows how false it is. Thus one of the elementary formula of dynamics establishes the fact that one may increase at will the energy of a body of constant size by simply augmenting its velocity. Let us, therefore, imagine a machine formed of a pin's head turning in the bezel of a ring. If its gyratory force were sufficiently increased its mechanical power would equal that of several thousand locomotives. I have calculated that a little bronze sphere (density, 8.842), with a circumference of three millimeters, and, consequently, weighing one gram, turning in a vacuum around one of its diameters with an equatorial velocity equal to that of dissociated particles of matter (100,000 kilometers per second) would have a power of 203,873 millions of kilogram-meters, which would be about equal to the work performed in an hour by 1,510 locomotives of an average power of 500 horses. Such is the quantity of energy contained in a small ball in rotation whose velocity would be equal to that of the particles of dissociated matter.

If matter contains such an enormous amount of energy would it not be possible to utilize this energy for industrial purposes? This will be the grand problem of the future. But at present we can dissociate only infinitesimal quantities of matter. Let us suppose, however, that we could dissociate one gram, and then let us see how much energy would be produced.

Let us take, for instance, a fifth part of an American five cent piece, which weighs one gram, and also let us suppose that we could succeed in entirely dissociating it. Now, the energy of a moving body being equal to half the product of its mass by the square of its velocity, a simple calculation gives the power represented by the particles of this gram of matter moving with the velocity we have supposed. This equation gives 510 billions of kilogram-meters, a total which would correspond to about six milliards eight hundred millions of horse power if these kilogram-meters were expended in a second. If this quantity of energy were properly distributed it would suffice to move on a level a freight train reaching round the earth more than four and a quarter times. To move this same train by means of coal 2,830,000 kilograms would be required, which, at the rate of 24 francs per ton, would cost about 68,000 francs. This figure of $68,000 represents, therefore, the market value of the intra-atomic energy contained in a nickel.

The magnitude of these figures, which at first glance appear impossible, is due to the enormous velocity of the mass put in motion, a velocity that could not be approached by any known mechanical device. Tho the one gram mass is very small, its velocity is very great, and consequently the effect produced by it is also very great. Energy increases, as is known, with the square of its velocity. This is the reason why the tendency of modern artillery is to reduce the caliber of the projectiles, but to increase their velocity.

The equilibrium of intra-atomic energy is very stable, since matter is dissociated so feebly that for a long time it was thought indestructible, as has already been said. The stable equilibrium of what is called matter also influences our senses in the same direction. But the other forms of energy, light, electricity, etc., are characterized by a very unstable disequilibrium.

The origin of intra-atomic energy is not difficult to explain, if we accept the statement of the astronomers that the condensation of our nebula alone suffices to account for the constitution of our solar system, for a like condensation of the ether would be enough to engender the energies found in an atom. Roughly, we might compare the atom to a sphere into which, at the origin of the world, had been compressed, to billions of atmospheres, a non-liquifiable gas.

The practical interest of the doctrine of the decay of matter by its transformation into energy will appear only when the means is found of easily producing a rapid dissociation of bodies, when an almost unlimited amount of energy being placed at the disposal of man and at no cost, the condition of things as they now exist will be radically changed; the poor will become the equal of the rich and the social question will thus be solved.

PARIS, FRANCE.

Murder in the Mountains and the Metropolis

BY WILLIAM E. BARTON, D.D.

Author of "Life in the Hills of Kentucky," Etc.

IT has been the recent good fortune of the writer to visit two American localities in each of which at the time the current sensation was a homicide, and in one of those places to be a witness of the events immediately following the crime and almost of the crime itself. One was in New York City and the other in the mountains of Kentucky, two regions typical for their belated civilization, but presenting some interesting contrasts; one or two of which presented themselves in connection with the incidents to which reference has been made.

It was on the campus of Berea College on Commencement day that the first of these tragedies occurred. The campus was filled with people. Hundreds of horses were hitched to the trees; thousands of people filed in and out of the tabernacle and visited in the shade. The day had been one of unbroken quiet. The deputy sheriffs and local police had been busy the evening before, gathering in those men who came to town drunk and "shooting up the pike," and five of them had spent the night in the lock-up and would not be released until after Commencement day. A guard had been stationed a mile out of town on every road leading into town, and a quantity of moonshine whisky had been confiscated. So far as known none had made its way into town. The officers had done their duty well. There was no drunkenness or rowdyism, no sense of fear or anxiety. My friend, who edits a paper, and I came out of the Tabernacle rather late in the afternoon, and commented on the growth of good order year by year and spoke of the time when the great gathering had involved some hazard.

Just then a pistol shot was heard, over toward a corner of the campus, and I proposed that we go that way.

"Can't you get into trouble enough without going into it deliberately?" asked the editor. But we both went.

As we neared the spot the word flew back that one woman had shot another; and when we arrived the dead woman had been carried into one of the small buildings and the other woman had been arrested and led away. On the steps of the building where the murdered woman lay stood a professor who called for a rope to hold the crowd back from the door and this was quickly done. My friend and I passed thru and stood beside him.

Just outside the door stood an unkempt, barefoot boy, sobbing; the woman who had been shot was his mother. But his sobbing was not with abandon: it was as if he felt he had no right to weep out all the bitterness of his grief. One of the professors led him away and cared for him, and he did not go inside.

The dead woman lay inside alone. The officers who carried her in were out hunting a justice and summoning a jury for an inquest. One deputy guarded the door, and we stood with him. No man cared to be the first to go in.

A woman pressed against the ropes and asked admission. She knew the dead woman, and gave her name and her own, and was admitted and asked to remain and identify the body. She passed inside alone, and returning said there was no doubt of it. It was Susannah Black, who worked for her neighbor in a neighborhood some ten miles away.

"Was the deceased a woman of good character?" she was asked.

"No, sir, I couldn't say that. She was a-talkin' to married men."

"Talkin' to" is a technical phrase for love-making.

The coroner was at the county seat; and in his absence a justice was sent for.

The justice arrived in all the dignity of his office. He wore a short coat with the collar turned up and a wide and

weather-beaten straw hat, which he did not remove at any time during the trial. He had a three weeks' growth of beard, and could not have been called a dandy. His first official act was to produce five cents and send to the store for a tablet of paper on which to make his records.

I wish I could give an adequate pen-picture of that inquest. Perhaps I can. It is a good illustration of the way they do things in Kentucky.

We went inside, the justice, the six jurors, a few witnesses and not many more, twenty of us, perhaps, altogether. The justice proceeded to swear the jury, and the way he administered the oath was the same then and afterward. He lifted his own right hand timidly, and about to the level of his shoulder as he began to repeat the oath, and each time he took breath he gave it a little jerk upward till he got to the words "to the best of your knowledge and belief; so help you God," when one final elevation brought it as high as he could reach. In like manner his own confidence increased with the progress of the procedure. As he questioned the witnesses he wrote down their replies, or the gist of them, in very long hand, standing all the while, and walking back and forth around the corpse to get nearer to the witness as he asked the question, and back to the blackboard to record the answer. He did not sit, but wrote against the blackboard, turning his back on the room each time and sometimes nearly stepping on the corpse. Yet there was about it all a certain rude dignity, a sense of official responsibility, a directness of inquiry, and something also of familiarity with the forms of court procedure which redeemed it in part from the grotesque. Indeed, there was about it all something bunglingly and incongruously appropriate; a reminder that this court was of the people, even as to his old straw hat and desire for justice.

The dead woman lay on the floor. Those who brought her in had folded her hands across the body and laid two pebbles on her eyes and tied up her chin with a handkerchief. Her dress had been opened and her breast was bare. The bullet, which had entered from the back, showed under the skin between the breasts, and slowly, slowly grew dark and more plainly visible. She wore new shoes and stockings, and the shoes had gay buckles upon them.

There are times when it would be a comfort not to believe in immortality. Who can sit and look at such a sight and not wonder where she is and how she fares and how her past life appears to her in the surprise of the life beyond? And yet who knows how much she sinned and how greatly she had been sinned against?

The details of a country inquest make it impossible to think consecutively about the horror of the crime. One almost reproaches himself for his inevitable turning to irrelevant things. It becomes easy to see how a very little experience in such matters dulls the edge of sympathy and sets one to thinking of it in terms of utility and average.

One witness only put anything of life and heart into her story. The rest simply saw the deed or knew one or both the parties. But this woman's husband was a remote cousin of the husband of the defendant. They both bore the plebeian name of Nubbins. She told how she stood with her cousin, the defendant, when the woman now dead came by and asked for the husband, asking tauntingly, maliciously, and the wife answered: "You'd orter know; you've seed more of him today than I have," whereupon the bad woman laughed and tripped away in her new shoes with the buckles. Then the witness continued:

"And Nannie says to me: 'That woman better not pester me no more. She's been a-worryin' me now for a right smart spell. Ef she does that just oncet more she'll git what she don't want.' An' I says 'Nannie, don't you do nothin' rash'; and she says: 'I don't keer what I do. I'm that pestered I don't keer whether I live or die.' Bymeby the Black woman come by agin and ast agin where Joe was, an' Nannie quarreled at her. An' she just laughed and said to Nannie: 'You cain't help yourself, nohow.' I was a-lookin' at her, an' I seen her turn to run, kind o' scared like, and just then come the shoot, and she fell—jest run two or three steps more and fell; and I looked around at Nannie and she was a-holdin' the pistol and hit a-smokin'."

The justice was minded to close the inquest without bringing in the accused woman. "What's the use?" he asked. "She admits she done it!"

It seemed to him a new idea that tho she had freely admitted the deed out of court she might deny it in court; but with a desire to have all proceedings regular he sent for her.

The accused woman was brought in, with her husband and a little daughter of three. She was seated on the front seat, within a yard or two of the corpse; and during the tedious and to her only half-intelligible proceedings that followed she had nothing to divert her attention from the one horrible object before her. There she lay, the place still visible out of which a deputy had cut the bullet with his pocket knife, the wound bleeding hardly a drop either in front or back; so small a wound, so little loss of blood, such instant death! There she lay, her taunts hardly cold on the mocking mouth now tied shut with the handkerchief; the pebbles on her eyes, the new buckles shining on her new shoes! And what was Nannie thinking of it all the time? I sat within a yard of her and looked hard at her. Did she regret it? If so she did not show it. Her face was pale, but firm. There was no hysteria, no weeping. What does a woman think when she has killed another, and has to sit for an hour and look at her dead body, first at the pebbles on her eyes and then at the buckles on her new shoes, and then at the place where the bullet lodged? And what does the man think who sits between them, his living wife and his dead mistress, and realizes that his conduct has killed one woman and made another a murderess? And what does a little girl think who sits in her father's lap and turns wondering looks, first at him, then at mother, and then at the dead woman on the floor? Terrible are the tragedies of childhood. I look at the little girl and think of the sobbing of the little boy outside. It is a study in psychology. Nannie is impassive; her husband is stolid; the little girl simply wonders. And I wonder. I wonder if Nannie would bring her dead rival back to life if she could. I think she was sorry in a way, but I do not think she would have brought her back to mock her again. And yet I only guess; there is nothing to be learned from her face.

There are two deputy sheriffs near Nannie and her husband, one on the seat beside them and one who has slipped in just behind. He is a young lawyer from the county seat, who, having no pressure of business from clients, has resolved to earn an honest two dollars this day as deputy sheriff. To him the opportunity opens prosperously. Sitting behind he whispers to Nannie and her husband, advising them not to testify, and her not to repeat in court the confession she has made outside. They heed him, and accept his services with a mere nod or two. But that is enough. He who entered the room as a deputy sheriff is now transformed into attorney for the defendant; it is a more profitable job, and, for that matter, leaves him still free to finish his day's work as deputy! It is an ill wind that blows naebody guid. When the inquest is over he lights a cigar and struts away with undisguised satisfaction. Such an event may be the turning point in his career. He is already shaping the plea that he will make, appealing to the sympathy of the twelve good men and true not to condemn this woman who strove to protect the honor of her home. That plea will stand him in good stead at the county seat; but here it is not needed. All that is necessary here is to keep her silent, and this is not difficult.

The verdict of the justice's inquest is short and direct, finding that the woman came to her death as the result of a pistol shot fired by Nannie Nubbins, who is held to an examining trial two days later.

So we went out, leaving the body in the hands of the village undertaker, to be buried by the town.

Two days later I went down on the train with the husband of Nannie, a decent appearing fellow. I did not address him, but I wondered much what he had been thinking in the intervening thirty-six hours. He showed nothing from which a judgment could be formed, and he walked to the court-house where Nannie awaited him.

The examining trial was shorter than the inquest. The number of witnesses was fewer and the facts were elicited more promptly. The young lawyer made his brief and fervent plea, and the verdict

followed quickly. "Not guilty—self-defense." This was the verdict. Self-defense; and the dead woman was unarmed and shot in the back! But the theory of self-defense advanced by the young attorney was more flexible; she was defending her home, her honor, the good name of her children. Yes, it was a clear case of self-defense, as adjudged in Kentucky.

There were some reporters present at the Berea Commencement, and so the shooting became known to the world. That was an accident which cannot well be helped, and is not to be attributed to the custom of the country. The theory there is that the thing is done, and the woman needed killing, and while the manner is to be deplored, the least said about it the better.

Very soon after this event I visited New York City, which also, like the Kentucky mountains, is a place of belated civilization. There a shooting had occurred, somewhat similar. In that case there were two men and one woman, and so it was a man who shot another man, and the woman had more new shoes with buckles. Otherwise the cases were practically similar. And the city was preaching about it and talking about it and the newspapers had unearthed as many as forty pictures of the woman, and were blocking the streets with their cameras in efforts to obtain more, and were telling about the millions that would be spent on the trial, and were publishing the grewsome details, not merely of the crime, which would have been relatively wholesome, but of the sins that produced the crime.

And I have been wondering which, after all, is the better way, the crude method of the Dark and Bloody Ground, or the alleged civilized method of darker New York.

And in the long run, which is the more likely to discourage adultery, to promote the purity of the home and benefit the community? And when the court meets in New York, with all its money and learning and array of legal talent, in which place is justice more likely to be done, there, or by the slow-writing justice in the short coat with the upturned collar and the stained straw hat? Which is the better way, that of the mountains or that of the metropolis?

Crossing the Line

BY SILAS X. FLOYD

As when across the far horizon's rim
  The watcher sees the white sails slip from view
  And wafts o'er gleaming waves a fond adieu,
While soft and vagrant tears his eyes bedim,
He knows his loved one is not lost to him
  But, safely guided by the good ship's crew,
  Her long and lonely way she doth pursue
To some fair clime beyond the waters grim:
So when our loved ones cross the line and go
  Far, far from sight, altho we do not smile
And tho our ardent tears fall soft and slow,
  Far, far beyond the reach of time and guile
They wait us in a fairer clime, we know—
  Not lost, not lost, but parted for awhile!

Augusta, Ga.

The New Wheat Center of the World

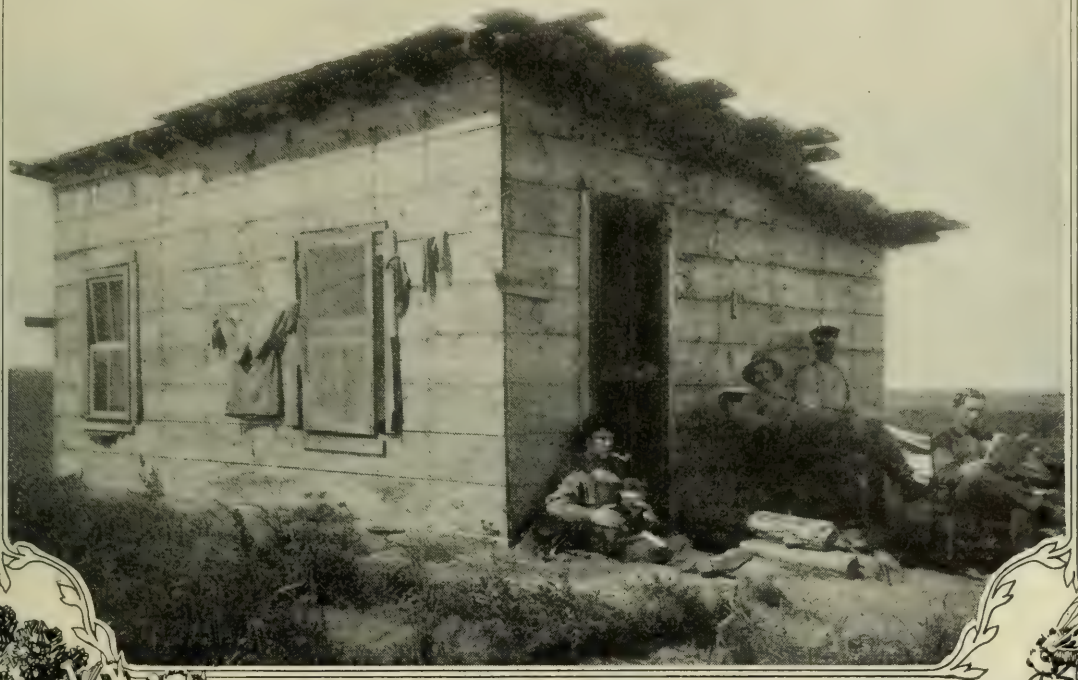
BY W. FRANK McCLURE

AWAY to the north of the rich wheat-growing centers of the United States—Montana, Minnesota and the Dakotas, and far to the west of the old Canadian provinces of Ontario and Quebec, and where the track of the buffalo and the trail of the Indian are as yet scarcely obliterated, a new agricultural empire has made its appearance upon the map of the world. Its arising is of great moment, for it is soon to be the bread market of the globe. Nearly a hundred million bushels of wheat found their way from this new center of civilization to the outside world in 1905, and there remains seventy million acres of unoccupied wheat lands yet to be settled.

This vast tract of fertile prairie was, not so very long ago, supposed to be a barren waste. Now it is predicted that the present generation in Western Canada will witness the growing of wheat upon forty-five million acres of the wheat belt, with an average production of twenty bushels to the acre. This yield will exceed the present annual production of the United States by two hundred million bushels, and will equal one-third the crop of the entire world. So promising have been the Dominion's invitations to the new El Dorado that she has already gathered unto these Western provinces 200,000 Americans, not to speak of hundreds of thousands who are pouring in from other lands. It is prophesied that it will not be long until ten per cent. of the people in the Dominion will be either of American birth or parentage. Millions of American capital have already been invested across our northern boundary, and the current interest in reciprocal relations with Canada is steadily increasing.

The product of the Canadian lumber camps would even now be coming to the relief of the rapidly decreasing timber supply of the United States were it not

One of the many agricultural centers, with its numerous mills and elevators, which have been springing up recently, not only in Manitoba but in Alberta, Saskatchewan and Assiniboia.



for the tariff imposed. Our American millers are using a portion of the output of Canadian grain. Iron ore from the new mines of Algoma has found its way to the furnaces of Pittsburg despite the tariff. Thirty-three per cent. of Canada's exports of merchandise come to the United States, and nearly sixty per cent. of her imports come from this country. The distance between the two countries is so short and the inhabitants being of the same lineage and speech, it is but natural that our interests should be mutual to a large degree. We use the same inland seas in the transportation of a volume of heavy traffic that has no parallel, and both Canadians and Americans fish in the same waters save for an imaginary boundary line.

Arrival of grain at a rural station. The erection of elevators has closely followed the building of railroads everywhere in Western Canada, the barns of the farmers not being equal to the task of storing the abundant crops.

During twenty years prior to 1881 Minnesota gave away twenty million acres to secure colonization railways. Soon after 300,000 miles of railway had been constructed, the population exceeded 100,000 people. Canada profited by a few such examples of tact and enterprise. In one year she spent $205,000 in encouraging settlers from the United States and between 45,000 and 50,000 responded, taking with them stock and personal effects valued at several millions of dollars. The area of unoccupied lands subdivided that year amounted to 12,000,000 acres. There are also plans on foot to bring into the Dominion the unemployed British and a goodly number of Belgians.

The pioneer cabin is typical of the way in which many of the settlers of Manitoba, Alberta and Saskatchewan began life in a new country. The neat two-story home represents the present day environments of the same locality. Transformations such as this have time and again taken place within periods of two years. The yields of a year or two enable the ambitious farmer to branch out and soon he becomes an agriculturist upon an extensive scale. Rural schools are established five miles apart and

churches soon follow. Local councils, elected by the people, govern municipal affairs.

The province of Manitoba, the oldest of the provinces of the Northwest, is as large as England, Ireland and Scotland combined. Last September, Alberta and Saskatchewan, which were previously but territories, became provinces. The spirit of these provinces differs greatly from the older centers of population. The natural tendency is to do things upon a gigantic scale. Quebec, Toronto and Montreal are slow when compared to the hustle of Winnipeg, and Eastern Canada farms are pigmies when compared to the wheat fields of the prairies. This is likewise true in the United States. In the East we raise peas in beds a few feet square. In Colorado a bed may comprise three thousand acres. In Nebraska there are single farms upon which the annual payroll amounts to thirty thousand dollars.

A Canadian farmer, when breaking ground, uses gang plows, and thus in a very short time makes a very big impression. Plowing, harrowing, drilling and rolling are carried on side by side with a dozen or more teams working almost neck to neck, and twenty to fifty men are employed upon one farm. At harvest time a half dozen or more binders make their appearance in the fields, followed a short time later by the threshing outfits, brought into the very midst of the grain. The farmer of Western Canada has the advantage of the pioneers of the States in that he may equip himself with the modern implements and facilities in use in the most highly developed parts of the world.

Spring planting begins perhaps before the end of March. By this time the snow is gone and does not fall again until December. The prairie land is easily broken, and, once planted, vegetation is not long in making its appearance. The harvest, however, is the supreme moment, both with the settler and the railroads. The golden grain, once ready, must be handled with all the genius and dispatch of which the twentieth century will permit. Anxiety is written in the grower's face until his crops are safely sheltered and thus out of the path of a possible heavy fall of rain or snow. Sometimes the grain is not even stacked, but goes into the threshing machines, from which it is soon delivered into bags and hurried to the nearest storage elevators. The barns of the settlers are not large enough to contain the immense crops of the wheat belt. Besides Mani-

toba, Alberta and Saskatchewan, the wheat belt includes 19,000,000 acres in the Territory of Assiniboia.

West of the Upper Ottawa River and to the north of Lake Huron and Lake Superior is a portion of the Province of Ontario which has recently been found to possess both the soil and the climate necessary to luxuriant crops of both agricultural products and fruit. The eastern districts of this "New Ontario" surpass the rest. They comprise those of Thunder Bay, Rainy River, Nipissing and Algoma. In the Thunder Bay district alone there are 25,000 square miles, which gives some idea of Canada's chances for spreading her settlers' domains. In fact, "New Ontario" is greater than Ontario in area.

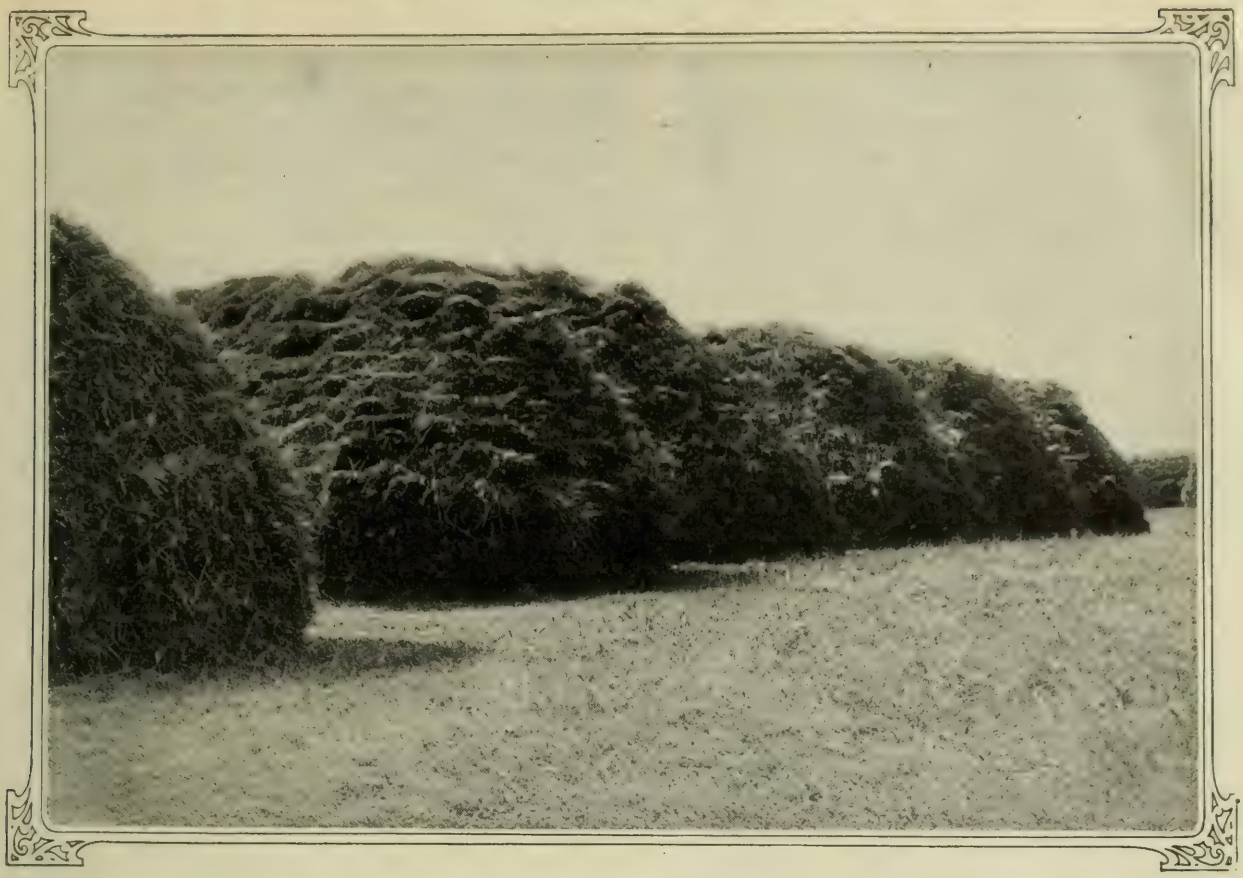
Abreast or in advance of the agricultural development of Western Canada are the railroads. Possibly no other country, in proportion to its population, is making such rapid strides in railroad building. Canada now has 20,000 miles of tracks, and ranks eighth among the countries of the world in railway mileage. With a continent larger than the United States, her work in this direction is just begun. The Canadian Pacific and the Canadian Northern both reach into the rich wheat country and to the important cattle ranches of the new empire, and the Grand Trunk Pacific will soon do likewise. The Canadian Pacific is now contemplating the double tracking of its road from Fort William to Winnipeg at a cost of $10,000,000. In Canada there is a Minister of Railways, whose duties are chiefly to aid the building of railroads, and to this encouragement on the part of the Government no little portion of her recent marvelous development is due.

At harvest time the railroads summon thousands of extra cars to the wheat belt, but the rapid increase in annual yields taxes their utmost capacity. From hundreds of storage elevators all along the railway route the golden grain is hurried to the larger elevators on Lake Superior, train after train moving forward at short intervals. The great shipping points of Lake Superior are Fort William and Port Arthur, the combined capacity of the elevators at these harbors exceeding 20,000,000 bushels. The heavy movement of Canadian wheat by

Typical agricultural operations in the new empire. It is not an uncommon sight to see plowing, drilling and rolling carried on side by side.

the Great Lake route the past year continued until the close of navigation, and still the elevators of both the wheat belt and of the shipping ports are almost bursting with their load.

The Canadian Government is spending a great deal of money to develop the all-Canadian route to the seaboard and to attract the grain trade from American shores by way of the same course. From Lake Superior this route extends over a thousand miles of waterway, including some 70 miles of canals. On reaching Montreal the grain is placed in elevators and subsequently shipped abroad in ocean steamers. Otherwise grain may go to Buffalo by Great Lake steamers and thence by rail to the seaboard.



The Dominion Government has expended more than $100,000,000 in the original construction, enlargement and maintenance of her canals. Recently extensive harbor improvements have been in progress at Montreal. At Port Colbourne several thousand feet of new breakwater and docks are building, and the depth of the harbor will soon be such that the largest vessels may be accommodated. Here, at the entrance to the Welland Canal, some of the biggest elevators extant have been under construction—elevators with a capacity of 2,500,000 bushels and 100 feet high. The newest ones, in addition to their working departments, are equipped with storage tanks of steel and with self-emptying bottoms. The cry of the grain trade on the all-Canadian route is for Eastern elevators, in order to keep Canadian grain in Canadian channels. Montreal in the past has suffered from lack of these facilities. Canada is also building new vessels to take care of her growing traffic. There were constructed in one recent year 328, with a registered tonnage of 30,000 tons.

An important Canadian project—important to the United States as well as Canada—is the proposed Georgian Bay ship canal from Georgian Bay to Ottawa, to cost $10,000,000. The Dominion Government has already appropriated $150,000 for the preliminary work. This canal would provide a new route for the wheat of the Northwest, including American shipments. It would reduce the distance by water from Chicago to the St. Lawrence, and Lake Erie would be cut out of the course entirely.

Unsettled tracts of land in Western Canada are secured by immigrants either from the Government, in accordance with the provisions for granting homesteads, or are purchased from the railroads, to which original grants of land were made. The homestead territory is divided into

Harvesting Upon An Extensive Scale.

Manitoba wheat, claimed by Canadians to be the finest in the world. An interesting array of stacks such as the average eastern farmer has never seen.

townships 6 miles square, each township being divided into 36 sections, which, in turn, are cut up into 160-acre tracts. Upon one such tract the annual taxes amount to $2 or $3, and, when a school district has been established, to $10. Any man over eighteen years of age may acquire one of these tracts by paying $10 in cash and residing on the land three years. If later he desires additional land he can obtain it at perhaps $5 an acre. During his first three years' residence he must keep at least 15 acres under cultivation or may support 20 head of cattle. Before a patent to the land is issued he must become a British subject.

The Government of the Province of Manitoba supports a traveling school of dairy instructors, which goes from one village to another, teaching and demonstrating the best methods of making good butter and cheese. These instructors likewise advise the farmers in the successful raising of stock. The Government also maintains an experiment station at Brandon. In keeping with these institutions, the settlers themselves have organized farmers' institutes. This twentieth century spirit of progress is showing its effects upon the country's exports in dairy products, of which Great Britain is the largest consumer. Canada's exports of cheese exceed twenty million dollars in value and her butter six millions.

The Canadian farmer is planning to avoid some of the grave mistakes made in the early days of the United States, where the grower, anxious to reap large returns from the virgin soil, allowed the ground to become impoverished. A slight deterioration upon a small area in Manitoba has given the necessary warning that nature's laws must not be violated. Instead of the barren waste which this vast new wheat country was once believed to be, the soil comprises a heavy black loam, one or two feet deep, practically free from stones.

The ranching centers lie chiefly in the prairies of Southern Alberta and Southwest Assiniboia, where the weather, despite the predictions of a few years ago, is such that cattle may graze upon the natural grasses which cover the plains and need no shelter. These lands are particularly adapted to the ranchman's needs, for, altho there may be a dearth of rain at times not experienced in the agricultural sections, there is water and to spare for the cattle in the natural streams.

Even in winter the natural grasses furnish the cattle with food, it being only necessary to feed the calves or younger stock. Canada's exports of cattle are increasing with great rapidity, and, it is prophesied, will soon reach $15,000,000 annually.

The great metropolis of the new empire is Winnipeg. It has rightly been styled the "rallying point of the prairies." From Winnipeg immigrants are distributed by the thousands to the wheat fields and the cattle ranches which lie beyond. At the beginning of the harvest, when additional laborers are necessary to the garnering of the crops, this city doubles its activities, as the railroads unload hundreds of newcomers every 24 hours. An increase of 50,000 in Winnipeg's permanent population has been chronicled in three years, until now this city ranks with several of our American cities of the first class, and in the Dominion is only exceeded by the populations of Montreal and Toronto. This marvelous growth has been equaled only in the midst of the wheat belt itself, where towns of 1,000 inhabitants have become cities of 10,000 population in a year.

ASHTABULA, OHIO.

An Object Lesson

BY ALICE STONE BLACKWELL

EDITOR OF THE WOMAN'S JOURNAL.

AN object lesson will sometimes bring truth home to minds that cannot be reached by abstract argument. A man in a strange city, going into a building which he supposed to be a church, would be quickly undeceived if he found himself in an assembly of thieves, thugs and drunkards, singing ribald songs. A man who fancies he is taking high moral ground on a public question may well become doubtful if he is in the right place when he finds himself in company with all the bad elements of society. In other words, we may often form a good guess at the merits of an ethical question by observing the forces that array themselves for and against it when it becomes a practical issue in politics. This was conspicuously shown in the recent campaign over the equal suffrage amendment in Oregon. I was present during the last month of the campaign, and can speak with personal knowledge of the facts.

The amendment was endorsed by the State Grange, the State Federation of Women's Clubs, the W. C. T. U. and the State Federation of Labor. It had the support of a majority of the churches and a remarkably large proportion of the editors. Out of the 238 papers published in Oregon only seven actively opposed it.

On the other hand, the Brewers' and Wholesale Liquor Dealers' Association of Oregon sent out a circular to the retail liquor sellers saying:

> "It will take 50,000 votes to defeat woman suffrage. There are 2,000 retailers in Oregon. That means that every retailer must himself bring in twenty-five votes on election day. Every retailer can get twenty-five votes. Besides his employees, he has his grocer, his butcher, his landlord, his laundryman, and every person he does business with. If every man in the business will do this we will win."

The liquor interest also made a deal with the machine of the dominant political party, the machine agreeing to "knife" the amendment in return for a large contribution from the liquor men to the party's campaign fund.

Nearly all the trusts and giant corporations of Oregon signed a published appeal against the amendment. The Southern Pacific Railroad, which is said almost to own Oregon, threw its weight against equal suffrage, as the Boston & Maine Railroad did when an equal suffrage amendment was pending in New Hampshire a few years ago. Clearly the trusts and the railroad magnates fear

that women as voters might not prove submissive to corporation control. The street railway companies were opposed, it was said, on the ground that "women were erratic and would be likely to favor three-cent fares."

The vicious interests, of course, were a unit against equal rights for women. A vulgar card, bearing a picture of a woman's undergarment, with a coarse remark against equal suffrage, was mailed to the voters thruout the State and distributed at the polls. The young man who was employed as manager of the anti-suffrage campaign, we were informed, had been acting as the adviser and agent of the women who run disreputable houses in Portland, Oregon's largest city. Just after the close of the campaign he came to the Mayor of Portland to ask some favor for one of these houses in which he was especially interested. The Mayor answered: "Tell the women who keep the house to come to me and make the request for themselves. I have more respect for them than I have for you!" The Mayor himself told this incident to Rev. Anna H. Shaw.

A small group of millionaires' wives and other society women in Portland also formed themselves into an Anti-Suffrage Association and scattered literature; but their influence was slight compared with that of the great forces of evil with which they co-operated. The Portland *Oregonian*, the leading daily of the State, and one of the few papers that did not favor the amendment, said of them editorially:

> "There are arguments, and sound ones, against woman suffrage; but women who live in luxury and spend their time over rich gowns, bridge whist, pink teas and beauty shows cannot represent them. Every protest from women of this class against woman suffrage makes votes for it."

To sum up: Equal suffrage had against it a coalition of the saloons, the brothels, the trusts, the railroads, the machine politicians and the frivolous society women. Is there any instance in history where all these elements have been found arrayed upon the right side?

An equal suffrage amendment has been submitted in Oregon three times. Twenty-two years ago the opposition made a strenuous fight, and equal suffrage was beaten almost three to one. Six years ago the opposition thought the amendment had no chance of success, and made practically no fight against it, and it came within a few thousand votes of carrying. This year the opposition was thoroly frightened, and put up the most extensive and systematic fight ever made against a suffrage amendment in any State. After the election, the manager of the anti-suffrage campaign, already referred to, told in the Oregon *Journal* how he managed it. He says that in twenty-four out of the thirty-three counties of Oregon he had, on an average, from ten to twenty men at the different precincts on election day, working against equal suffrage, and 214 men working against it at the polls in Portland alone. Yet, in spite of all this organized effort and the vast amount of money spent by the opposition, the amendment got a larger vote this year than ever before. The negative vote also increased; but in the twenty-two years since the question was first submitted, the anti-suffrage vote has less than doubled, while the suffrage vote has more than trebled.

In 1884 the returns stood: Yes, 11,223; no, 28,176; in 1900, yes, 26,265; no, 28,402; in 1906, yes, 36,902; no, 47,075. The combination formed against it this year is said to have been the strongest ever formed against any public measure in Oregon. It shows how widespread the unorganized sentiment in its favor must be when a change of 5,087 votes in a total of 83,977 would have carried it.

Under the initiative and referendum in Oregon any question can be submitted to popular vote as often as its friends wish; and the women of Oregon are already taking steps to have equal suffrage brought before the voters again at the next election.

DORCHESTER, MASS.

Internationalism and the World's Capitol

BY DR. P. H. EYKMAN

[Dr. Eykman, who was born in 1862, is doctor of medicine at the University of Amsterdam. He has established at The Hague a physiatrical sanatorium, the first one of the kind in the Netherlands, and has founded the "Union of Physiatrical Therapeutics and Hygiene." He has also written several works on hygiene, but he has established his name in the scientific world principally by his various treatises, published by the Royal Society of Sciences, and by his invention of the movement-photography with Röntgen rays. His invention of a new graphical system of craniology induced the Anthropological Union of Munich to make him an honorary member, while he is secretary of the Dutch Anthropological Union. During the past ten years Mr. Paul Horrix has coöperated with him in his several practical works, and it is owing to this coöperation that gradually have grown the idea and the plans of the Foundation of Internationalism and of the World-Capitol. After having elaborated and projected together the plans concerning it, they visited America and then several other countries in order to confer with the prominent men there.—EDITOR.]

IT is only a few years ago that the Permanent Court of International Arbitration was founded at The Hague. The prospects of assigning a suitable building to this court were scarcely being executed when the whole world began to recognize that what had been reached was, in fact, only the first step in the right direction, that of fraternizing the nations. This international, organized co-operation is the fruit of recent years, and is best expressed by the word *Internationalism,* which, in this way, acquires a new and nobler meaning.

Just as every State is an organism and the perfection of this organism is necessary to make that State powerful, so the collective international human interests must become one organism to keep them healthy and to prevent their untimely growth and final degeneration. Those collective international human interests are numerous; by way of illustration we might mention: Commerce, industry, arts, sciences, education, sanitation, economy and all similar principal interests of social life.

All these interests have not attained their full development, because a powerful world organization is lacking. It is true, a semblance of world organization, a faint shadow of what this ought to be, already exists in the International Congresses, but the organization of the latter is so imperfect that one can only deplore the fact that so many of the most eminent men meet to effect so little. If the organization were better, no doubt the world would derive much more benefit from its eminent men.

The limited space allowed for this article does not admit of a detailed discussion of all the organizations required. So I shall only point out in a few words what, in my own opinion, these organizations ought to be like, *e. g.*, in the domain of science.

The most eminent men of all countries form academies, one for each science, which should be permanent scientific organizations all over the world.

Each academy may be divided into sections, if it comprises cognate branches of science. The various academies may enter in contact with each other concerning questions of common interest. Each academy has its members, the manner of whose appointment will be discussed further on, in all the countries of the world, and has a permanent central commission. Each academy regulates the International Congresses to be held in the various countries, and collects a complete library of its own scientific branch. The Permanent Central Commission is the executive for these and other affairs.

This commission collects its material thru correspondence societies established in the different countries, and gives information of a scientific nature.

International statistics and *"Sammelforschungen,"* which the academy might deem necessary, are executed by the Permanent Central Commission. Prize competitions, the awarding of marks of distinction, the support of private initiative, belong to the work of the academy. If necessary, the academy gives advice to governments. Each academy may establish one or more practical institutes to

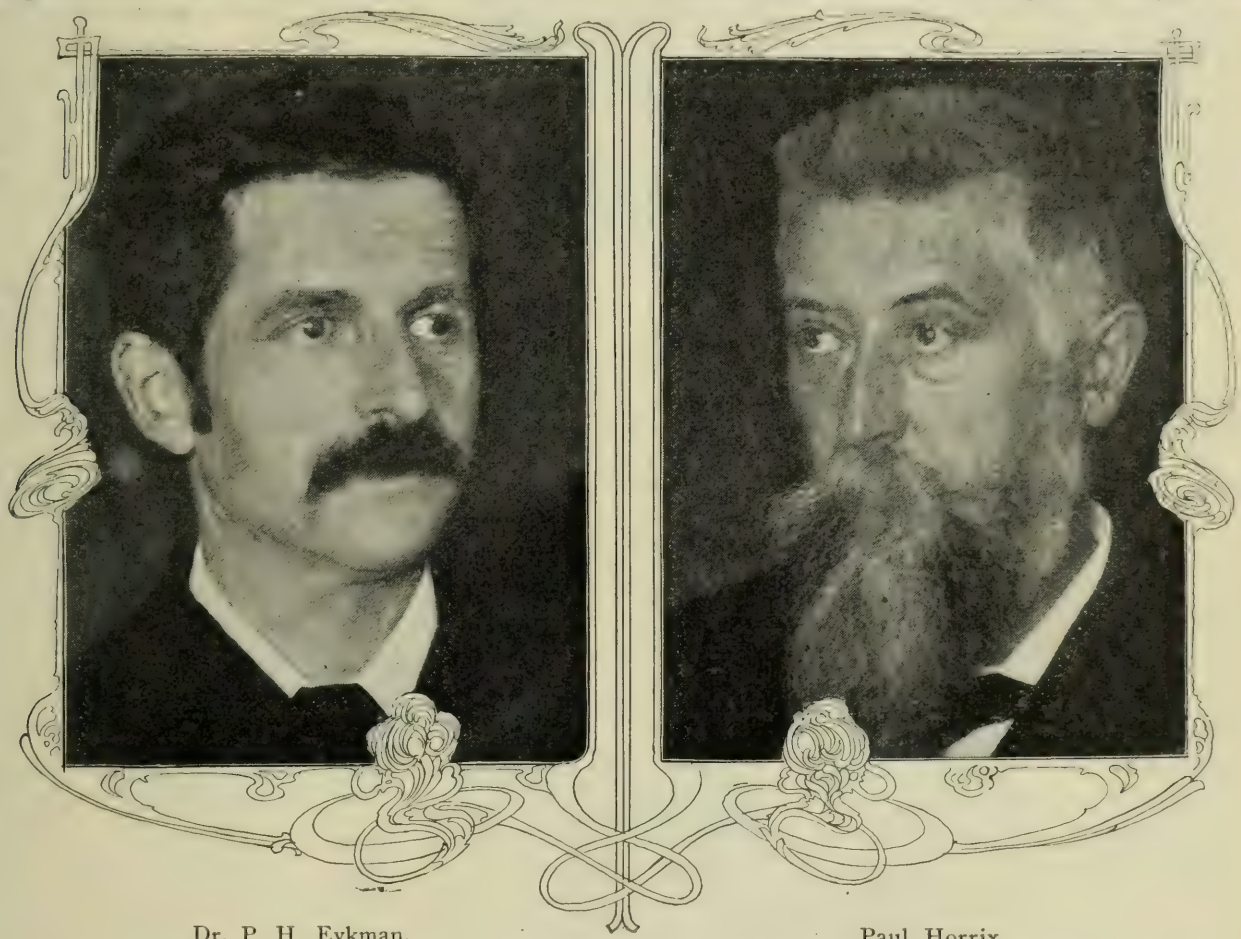
promote study or investigation directly, or to put the results obtained into practice.

These practical institutes may be world collections, training schools, laboratories, model institutions and the like. The word "scientific" must here be taken in the widest sense of the term. Consequently the number of academies will be very considerable, for besides the abstract sciences, the technical and the applied sciences are also comprised by it. It is true that a desire for international organization already exists, and that endeavors have been made to establish regular congresses with permanent bureaus, but the manner in which this has been done as yet has not yet developed that far-reaching power which would have so beneficial an influence on mankind.

What I think of primary importance is that these academies shall have great sums of money at their disposal.

Where is the money to come from in the long run?

It seems to me that, as in consequence of the growth of civilization less money will be spent on alcohol and war, a small part of the sums thus saved will be sufficient to effect those seeming wonders.



By such a world-organization private initiative would by no means be killed, but, on the contrary, be greatly supported.

In fact it is only with such world-organizations that the investigation into the origin, the spread and the cure of tuberculosis, cancer and other diseases could at all be undertaken with some hope of success.

Such a permanent congress might be called "International Academy" (*not* university), with the express stipulation that it be an unofficial body and have no connection whatever with diplomacy.

In the beginning at least this will be necessary; the possibility is, however, not excluded that in the future it will be necessary to grant certain privileges and some power to such an academy, in consequence of which it might become of some importance in the international government.

It seems to me that it would be well

Dr. P. H. Eykman. Paul Horrix.

The Two Projectors of the Plan of the Foundation of Internationalism and of the World's Capital.

to begin at once with the establishment of an Academy of Pedagogy, Hygiene and Economy, the scheme of which I present in a few words as follows:

The International Academy of Pedagogy, Hygiene and Economy consists of: Central commission, delegated members, extraordinary members and congress members.

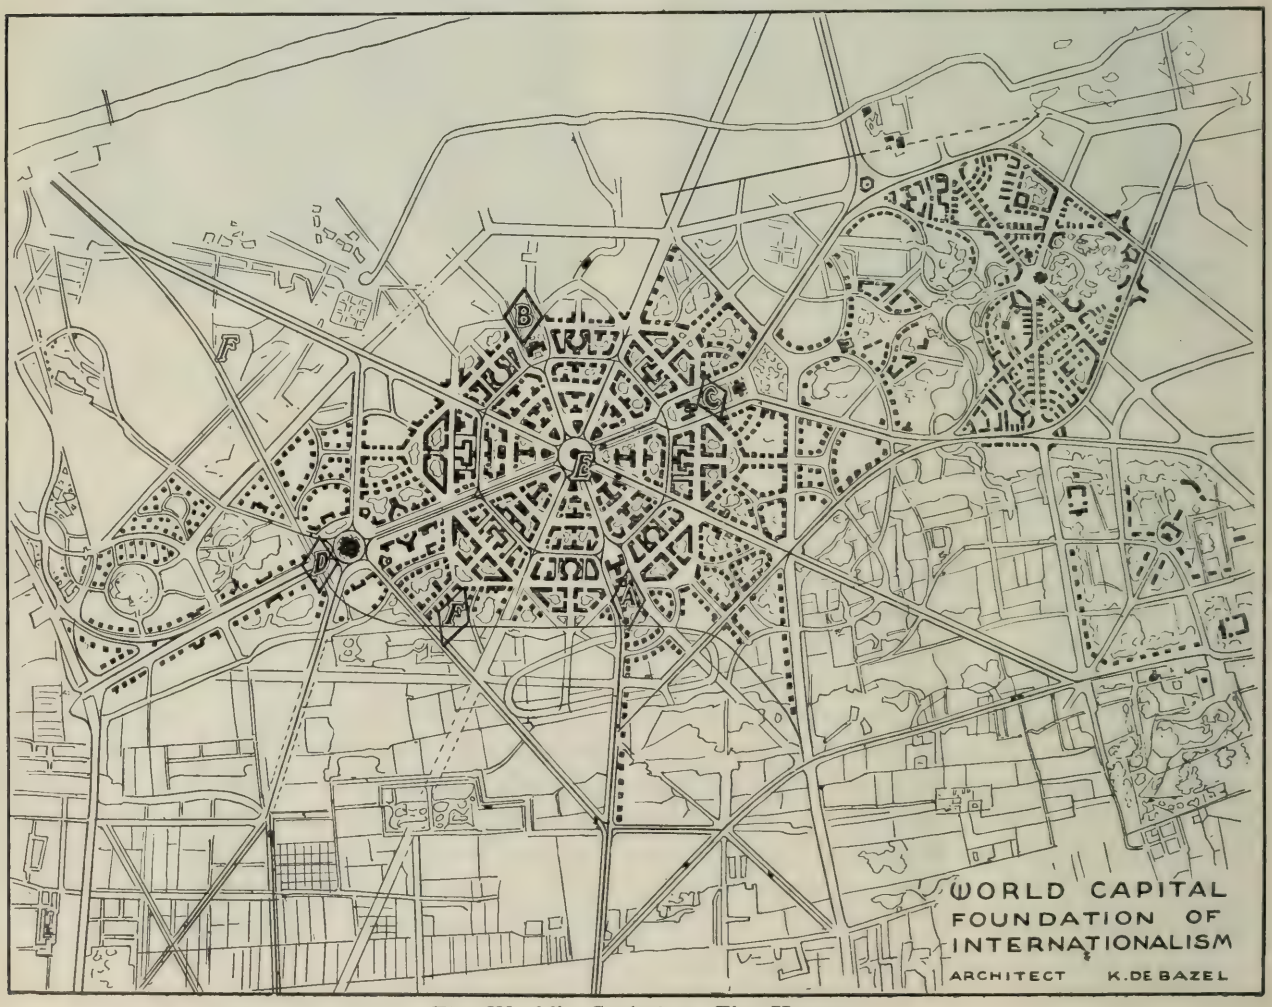
The central commission has the daily control of the academy and represents it to the outside world. It consists of fifteen members, among whom are one central chairman, one central secretary and one central treasurer. The remaining twelve members are divided into three sections, each of four members, respectively for pedagogy, hygiene and economy. Each of these sections appoints from its number one section chairman and one section secretary.

To the central commission is attached a chancery.

The central commission takes care of the library and of the publications of the academy.

It keeps continually abreast with and gathers all the information about everything which occurs relating to the academy.

It prepares all the meetings and congresses.



The delegated members are appointed and paid by the government of their respective States.

The number of participating states is for the present estimated at fifty-four, and the number of members, which every State may delegate altogether, is to be determined hereafter and estimated here at an average of five members per State, so that a total of 270 delegated members is expected.

The International Academy of Pedagogy, Hygiene and Economy can assume extraordinary members to a maximum number of thirty, who are paid by the academy.

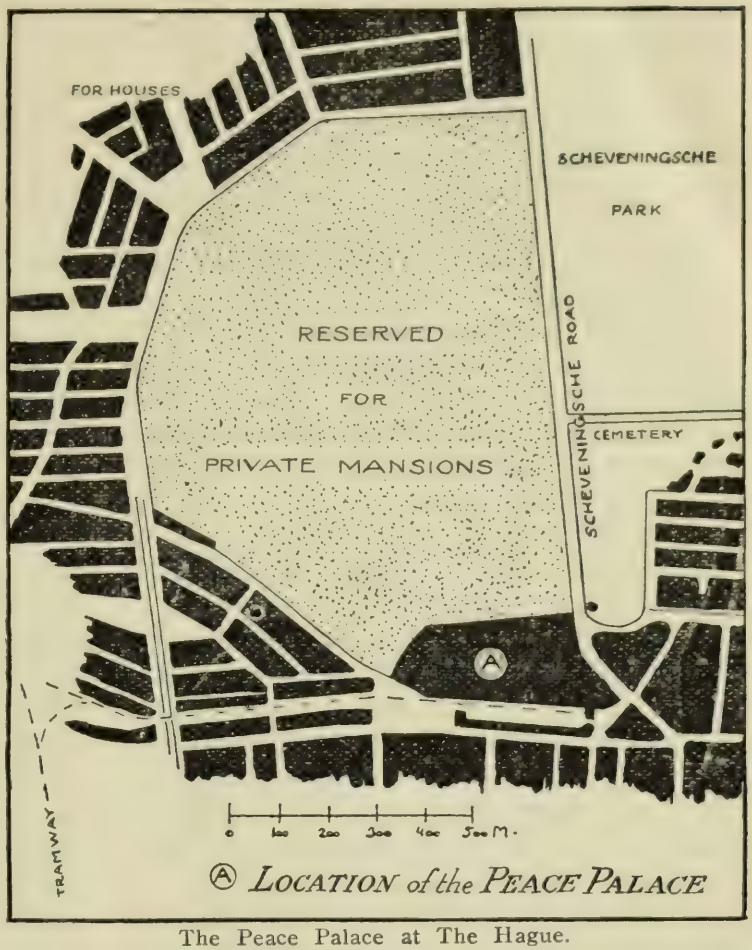
The different sections will not lack urgent subjects, for, besides the new questions, which occur every year, there are a great number of international interests which wait for solution.

When such an academy actually exists

The World's Capital at The Hague.

the need will soon be felt of practical institutes, which may serve, so to say, as training grounds, and where the different measures can be tried and their efficacy tested before they are decreed by the academy. Such practical institutes we have also adopted in our plan.

For pedagogy it will be an educational establishment or international school, arranged on the most perfect plan possible, which must serve as a model to others. This school, the number of pupils of which need not necessarily be very great, must, of course, be organized as the academy prescribes it. The pupils collectively will afford material for pedagogical study, which will be of the greatest importance.



As early as the year 1880 some of these principles were successfully introduced by P. Robin into the orphanage "Prévost," at Cempuis, in France. On a somewhat larger scale these principles were applied in the school at Abbotsholme, erected in 1889 by Dr. Cecil Reddie. This example has been imitated by Dr. H. Lietz, at Ilsenburg in the Harz in Germany, which institution succeeded to such a degree that an extension was soon required on an estate in Thuringia called "Haubinda."

Their results do not represent it as risky, but are on the contrary a vivid stimulus to imitate them on a very large scale, in order to give another example for the enlightenment of the whole world.

For the Institute of Pedagogical Reform in our plan a space is set aside, with woods, meadows and fields. Air and soil are reckoned among the healthiest of the Netherlands.

The instruction comprises:

1. The branches of the elementary school.
2. The handwork and polytechnics.
3. The cookery and household school.
4. The elements of nursing the sick and infants.
5. Hygiene and sport.
6. Secondary school.
7. Commercial school (shorthand and typewriting).

The Peace Palace at The Hague.

8. The first rules of agriculture and horticulture.
9. Grammar school.
10. Academy of music.
11. Academy of plastic arts.
12. Religious instruction.

Dry theoretical instruction will be avoided as much as possible.

Materials for instruction will be derived rather from real life in nature and society than from books. To attain this it is necessary that nature and society be continually at the disposal of the pupil, tho it be only on a small scale.

For the Academy of Hygiene such "practical institute" may be composed of various social hygienic establishments, as laboratories, a sanitary farm, etc.

As the word hygiene, taken in its widest sense, also comprises the nursing and treatment of the sick, I fancy that such an academy should also have a model hospital by way of a practical institute, on a moderate scale, it is true, but based on the modern principles and methods of medical treatment, having, in the first place, plenty of room and fresh air, so that every patient may undergo open-air treatment, if required.

One of the first things which the hos-

pitals are wanting is generally an extensive, healthy piece of ground, which guarantees sufficient pure air for the buildings. Generally there can be no question of open-air treatments, because the hospitals have to put up with limited space of garden and all the money is sacrificed as much as possible to the building and the inventory.

Especially for convalescents and nervous patients it is often necessary to procure for them healthy occupation in the open air. A large plot with nurseries is therefore indispensable for the treatment of the sick.

The economy of the practical institute will be a workmen's garden city for about one thousand workmen's families. Practical experiments can here be made in regard to the problem of workmen's houses, but at the same time this collective body of one thousand workmen's families will afford an excellent opportunity for the study of many other questions regarding the workman, as co-operation, life assurance, and so on.

It is evident that the international congresses now in existence need not be abolished, but that, on the contrary, they must be maintained, tho, of course, reorganized. For as much profit as possible must be derived from what already exists, especially as there will be great need of persons of practical experience, and also because the formation of new organizations, along with those already in existence, would only lead to division and waste of power. Therefore it would be of great practical value if now already a list of the different international societies and congresses which are already in existence could be obtained, and I politely invite all newspapers which should review this article to publish this request of mine, so that in a comparatively short space of time we may have fairly complete data at our disposal.

As in every country the ministerial departments and other government buildings are situated as close together as possible so as to be in continual touch with one another, so all the institutions of internationalism should as much as possible be brought together in one group, because these, too, have to assist and complete each other.

Considering that The Hague has been chosen by the different nations as the seat of the Permanent Court of International Arbitration, this city will also be the right place for a Foundation of Internationalism, superintended by an international board of curators.

This Foundation of Internationalism must be a moral body. It must get possession of the grounds on which the international institutions are to be built. To obtain the funds required it contracts a loan. Those grounds must be rather extensive, so that the foundation can sell the parts it does not require to private persons or toward private ends.

The great profits thus obtained go to the Foundation of Internationalism, and it will be impossible for a private person to profit by them. As will be explained later on, the Foundation will thus, in course of time, have considerable sums at its disposal, which it may use advantageously for its *own* ends.

The object of this foundation is in due course to organize on an international basis the different interests of mankind, to found the described academies and to establish the permanent bureaus of the latter. When these organizations have proved beneficial and have become indispensable, many of them will in due time be made into official bodies by the different nations. As long as this is not the case, however, the foundation will have to defray their expenses.

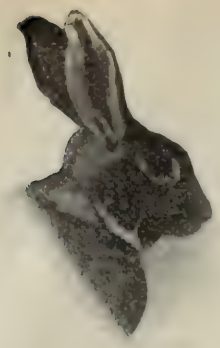
With a view to this it must have considerable capital at its disposal, both now and in the future.

How is this to be obtained? An answer to this question will be given in the following exposition, the principle of which we have adopted in our plan. It is undeniable that the Dutch kingdom and the municipality of The Hague are both closely concerned in the establishment of this Foundation of Internationalism within their territory. For the founding of some international buildings will considerably raise the value of the surrounding grounds. Now it is only fair that these profits should be used in the cause of internationalism instead of filling the pockets of private persons, as would be the case if the peace palace were built on the site till now assigned to it, viz., the little, insignificant corner, mentioned above, at one of the extremities of the real estate-speculation society "Zorgvliet."

It may be stated with certainty that the government of our country and the municipal government of The Hague are prepared to sell to the Foundation of Internationalism great areas of ground at a very moderate price, for the establishment of the institutions to which I have referred above. As to the remaining grounds, which the foundation does not require for international purposes, this foundation can sell them to private persons and ends at a price considerably raised in consequence of the world buildings being erected in the neighborhood of those grounds by the Foundation of Internationalism.

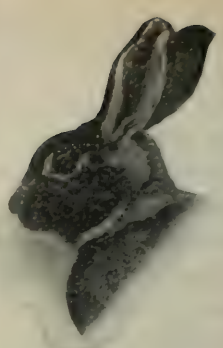
Now, the grounds required for our plan have been chosen in such a way that the World-Capitol — comprising the palaces and buildings of the various international world institutions, among which that of the Permanent Court of International Arbitration, to be located there on the *"Musschenberg"* (Sparrows Hill); that of the Permanent International Congress, proposed by Mr. Bartholdt, and of all other permanent international bodies which are going to follow—can be realized on grounds belonging to the municipality of The Hague only, and, as domain grounds, to the State of the Netherlands. Moreover, The Hague is just making a new project for extending the city, and the provisional plans made for this purpose have failed to meet with much approval.

Internationalism might at once avail itself of this state of affairs by making a well-devised plan of extension in connection with its own institutions. In this way enormous profits may be secured for the first fifty or one hundred years to come.



By mutual agreement on this point between the advocates of internationalism at one side and the government of the State of the Netherlands and of the city of The Hague at the other, invaluable services might be rendered to the world.

The grounds selected in our plan border immediately on the old city of The Hague, and are directly connected with the whole world by the electric railway from Scheveningen to Rotterdam. They are the finest part of The Hague, lovely dunes studded with woods and delightful views on all sides. From a hygienic point of view, too, they form the healthiest spot that can be imagined. For some centuries at least they will be able to satisfy the requirements of a growing internationalism. According to our plan a new town quarter will be established here, which in itself might be regarded as the World's Capital, built after a preconceived plan, just as the city of Washington was beforehand projected around its magnificent capitol. And thus this capital will be the material expression of the fraternization of the nations.



To realize this plan we need, in the first place, the sympathy and co-operation of the aristocrats of the intellect thruout the world. Each day gives fresh proofs that this sympathy is increasing, and the fear lest we should be striving after a mere Utopia is disappearing more and more and giving place to the conviction that the realization of our plan is possible and greatly desirable.

When the great leaders of the world shall have placed themselves at the head of this movement the money will soon be forthcoming, which, in the form of a loan, is to constitute the foundation fund for the establishment of the Institution of Internationalism.

THE HAGUE, 13 VAN LENNEPWEG.

On the Habits of Men and Other Animals*

BY PETER RABBIT

COMMUNICATED TO W. J. LONG, AUTHOR OF "THE WAYS OF WOOD FOLK," ETC.

THERE is a naturalist, a thoughtful man, who tries to forget that there are races and species, and to understand each animal and man just as he is under his own skin. In a whimsical humor, the other day, he was explaining to his friends why your wife wears a certain style of bonnet with pleasure for a little season, but feels most uncomfortable and ill at ease the moment her neighbors begin to wear something different. As an object lesson he caught a common sparrow, put a daub of red paint on her head, and then turned her loose among her neighbors. The moment they saw the unusual headdress all the other sparrows, male and female, began to make the poor creature's life miserable. They jabbered excitedly at first, calling in every idle sparrow on the street; then they set upon the sparrow of the bonnet and chevied her out of the flock and made her an outcast. Day after day she tried to return and be sociable, but the flock drove her away without mercy. When she persisted in her attempt, not seeing her own disfigurement nor understanding the situation, they fell upon her savagely one day and killed her.

"And that is the reason," said the thoughtful man whimsically, "why our women follow the style in bonnets."

Now you will smile at the thoughtful man's explanation, but the Rabbit sees a kernel of truth hidden in the husk of his philosophy. Your naturalists, like the dictionaries, usually define man as the rational animal, and call all other animals creatures of habit; but the Rabbit has a thought in his head that you men are more governed by habit than we are, and that, habit for habit, yours are generally senseless, while ours are marked by that sweet reasonableness which pervades the brier patch, and indeed every other corner of the universe, just so long as men are kept out of it.

Take, for instance, this universal habit among you which is called fashion. Why should your women, fat and lean alike, all wear tight sleeves today, and appear tomorrow with huge and abortive things in the same place, which make them look like caricatures of a beauty-loving god's handiwork? Why should your men—especially your young men of the colleges, who have fewer fashions than women, but are more enslaved to those they acknowledge—all alike, fat and lean, tall and short, shave their faces and have their hair cut in the same pneumonia-inducing way and wear the same bizarre hats and ugly shoes and neckties in the very latest fashion? None of these, remember, represent their own scant ideas of style; for all these fashions are originated by tradesmen, with the sole object of changing the styles as often as possible, and so of making money out of a college boy's infatuation.

The Rabbit was puzzled at this senseless custom until he remembered the sparrows and those other remote ancestors of yours, who had an excellent reason for what they did. Your fashions and your slavery to fashion are the direct result of the customs of the animals when they lived together in the herd or pack. Uniformity is there the absolute rule, and is necessary for the animal's protection. Your hunters have often noticed that gregarious animals and birds will drive away any member that has some striking peculiarity in his physical appearance. Nature has given to each animal the outward dress that harmonizes best with his surroundings and his mode of life.

The moment an animal appears in the herd with some peculiarity that calls attention to himself he becomes an object of suspicion. He is out of harmony, and therefore wrong; for to be harmonious with nature is the one great ideal of the animal, and possibly even men might learn something from his standard. Any

* Copyrighted, 1906, by W. J. Long.

peculiarity draws instant attention not only to the individual, but—a far more dangerous matter—it draws the eyes of prowling enemies to the harmonious herd of which he is a part. So they drive him away to live where his oddity will bring harm upon no one but himself. And this, if you but think of it a moment seriously, is the reasonable origin of all the unreasonable whims and vagaries of fashion which prevail in human society.

For your modern fashion is but the old safety-law of the herd or flock, stripped of all its virtue and reasonableness. In outward appearance and dress you follow it blindly, tho you have now no excuse or reason for it whatever; and you would look infinitely more attractive if you but used a little originality, and, when you find a becoming style, would stick to it reasonably, instead of following the hideous lead of your richer and fatter neighbor across the way. Meanwhile, in moral and religious matters, where you need segregation more than you need new laws and commandments, and where the old reasonable herd-law would be your moral salvation, you pay no heed to it whatever, but allow all sorts of moral and religious lunatics to live in the same street and mingle freely with your innocent children. The Rabbit finds nothing in his philosophy to explain why you should devoutly follow the old animal habit in dress, where it is out of place, and ignore it in morals, where you sadly need it.

The Rabbit sat down one day to observe one of your naturalists, who declares that animals are creatures of habit. The most noticeable thing about him, to a rabbit, was an uncomfortable stiff collar about his neck, as if he were ready, like a dog, to be tied up to the next kennel. It was a hot summer day, and the Rabbit learned with astonishment that the ugly collar had been made more uncomfortable still by being first soaked in white mud and then hardened by a hot iron, so that it was unclean as well as uncomfortable. The man wore also a stiff hat, which shut out all the air and cut off the supply of blood from his hair; and he had followed the senseless custom so long, I am told, that the top of his head had no more hair or character than a peeled turnip. He had crushed his elastic feet into unyielding shoes, made from the hard skin of some dead and diseased beast, which made the Rabbit's toes ache just to think of carrying the cumbersome things around all day long. All the rest of his uncouth dress was, like his hat and shoes, perfectly calculated to shut him out of every natural pleasure, from the tingle of air on his bare skin, the refreshing touch of the grass and the moist earth and the running water on his feet, making him cool and sweet and comfortable. He wrapped and swathed and bundled himself into a score of hard discomforts for a summer day, and all because it was the way of his breed to do so, and he never had a thought in his own head of changing the imbecile custom.

As with your clothes, so in other matters; of eating by the clock when you are not hungry, and drinking all sorts of abominable drinks when you are not thirsty, spoiling a natural pleasure by undue haste and untimeliness; of going to bed when you are not drowsy, and getting up yawning when you long to sleep; of smoking at all hours, of fearing good solitude and following contaminating crowds, shutting yourself up in dens that never see the stars, and breathing vile air that others have breathed before you—in all these, and a hundred other matters of your daily life, you seem to a rabbit to be bound, fettered and gagged by a multitude of physical and social habits that no free animal would endure for an instant. From birth to death, from the moment you rise hurriedly and dress till you lie down to broken and disturbed sleep, you are rarely free men, but are slaves of habits, nine-tenths of which are without sense or reason. The few habits of an animal are reasonable and essential and pleasant in their occupation; the multitude of yours are distasteful, unnecessary and injurious. Yet your naturalists call us creatures of habit, and you accept the classification without a thought of your own as to how little self-knowledge or observation there is in it.

It will be said that all this is only superficially true; that man makes his own habits and is free to change, while the animal's habits are born in him and remain there, without any power of his own either to make or to modify them; and this is another of the comfortable

generalizations that pass for natural history in your very interesting books. Ask your great biologists how much free will there is among you. Some of your habits are born in you; the rest are made for you by ancient custom or by modern society, and you have rarely the courage or the power to change them and to be yourselves. To change a habit of thinking among men requires centuries, and generally the blood of a few martyrs; while the animal changes his simple habits in a single generation, led by his own reasonable experience.

For instance, ruffed grouse, in the wilderness where no man dwells, are tame and unsuspicious creatures, barely moving aside out of your way; while the same birds in your own woods are wary and unapproachable. A few years has made a complete change in the habits of the bird, and in whatever counsels the mothers give to their little ones as they lead them about the woods. Now how long does it take men to change their habits of thought? There was a great branch of the Church that once held a barbarous idea of your God, namely, that he was a monster who damned innocent children and all the unelect. Every mother among you, and every good man who listened to his own soul, knew that the doctrine was false; yet it took that particular Church over three centuries to acknowledge the lie, and it does not even now declare openly a change in its habits of thinking.

So with your government, which long ago, as a little handful of colonies, adopted laws and a constitution. Some parts of the latter have been for a century a very millstone about your necks; but you cannot trust yourselves to change the habit. The Rabbit has heard of governments across the sea that for ages have ground down and oppressed their own people, keeping a multitude of men in ignorance and poverty and unending toil, in order that a few vain and vicious creatures may rest idly in their alleged nobility of uselessness; and even now, after all your boasted progress, they cannot or dare not change their ways of thinking. How long would the wolf pack stand such unspeakable nonsense in their leaders? Yet these slow Churches and governments, I am told, are two of the greatest institutions that exist among you.

You have still another curious habit, which you will never understand till you look at it out of eyes that are not yet quite blinded by custom. Suppose your God should visit you each year with a frightful calamity, with two sleepless nights of fire and accidents and death and general anxiety. Suppose he should kill and maim and burn 2,000 of you in a single day, putting out your eyes, tearing off your arms, and visiting you afterward with unnumbered cases of lockjaw, with all their suffering and horror; and all this for no better reason than to manifest the power or vanity of his dread, sovereign will. Even your few remaining Calvinists could not stand such an affliction; your churches would be emptied, and you would reasonably conclude that a devil, and not a good God, had some large part in running the universe. Yet you visit these horrors upon yourselves each year by a senseless and outrageous Fourth-of-July celebration of your independence; and there is hardly a man among you who ventures to teach even his own boy that it is an unreasonable and atrocious habit.

Now when an intelligent animal, whatever the habits of its ancestors, is injured or sees his companions caught in any kind of a trap, he not only avoids the danger himself, but tries also, according to the measure of his intelligence, to keep his little ones and his own tribe away from the danger forever afterward. A flock of common sparrows that taste poison or fall into a trap in one of your gardens need no repeated experience to change their habits and places of foraging. Indeed, with the exception of yourselves, the Rabbit does not know a single bird or animal that would require two centuries to learn that matches and gunpowder form an unsafe habit of jollification for thoughtless youngsters to follow.

Going deeper into your lives the Rabbit finds a still more incomprehensible habit, which, for want of a better name, he calls your acquisitiveness. For centuries each man has sought to grasp for himself as many of the world's common mercies as possible, and the habit has become so overmastering that in any of your streets the Rabbit can now see a most astounding spectacle. Here is a man who has seized for himself so much of the world's land and goods that his

descendants for generations cannot possibly use them all; while a few doors away is another man of the same tribe who starves, or who must work from morning till night with the awful fear of hunger or want for his own children.

The Rabbit will consider this spectacle in another meditation, on the subject of religion. Just now he simply points out to you that the wolf pack, whom you name as the symbol of rapacity, knows no such atrocious habit. What a wolf kills belongs to himself only when it is too small a mouthful to share. When he acquires larger game it belongs to his pack before he has taken a mouthful of it. Did he so far forget himself as to claim more than he needs, his intelligent neighbors would speedily teach him a better philosophy. The little ants that you crush under your feet have the fixed habit of working, each one for the good of the community of which he is a part; you men have the habit of working desperately for your own individual and selfish interests. Viewed from the brier patch, it would seem that the wolf and the ant have somewhat the more rational and desirable propensity.

Did the Rabbit hear you make objection that, if you were less strenuously acquisitive, you might lose your individuality? That would be quite true if individuality means selfishness; but in rabbit talk the two words have a somewhat different meaning. A rabbit who thought that, in order to develop his individuality, he must violently compete with his fellows in the same brier patch, and seize more than he needed while others went hungry, would be considered by other rabbits to be a victim of his peculiar vices rather than of his individual virtues. Besides, you have forgotten your own history.

The Rabbit Historicus tells me that your most wonderful city attained her intellectual and artistic greatness at a time when all her citizens worked for the community; that a little city called Athens produced, from the idea of working together for the common good, more mighty individuals in art and science and philosophy in a few generations than all the rest of the world combined has ever produced in as many centuries.

The Rabbit has no theories of government to recommend, being engaged in the pleasant occupation of governing himself harmoniously. He simply suggests that, viewed dispassionately from the brier patch, your habit of acquisitiveness, far from developing your individuality, is drawing you in constantly increasing numbers into an ignoble chase for material wealth, in which you have no more individual character than a crowd in the subway. For in your anxiety to get your share and a little more of the world's common mercies you incidentally lose that mental poise, that peace, that quiet faith in yourself and in your fellow man, which are essential to develop the best powers of the artist and the artisan. So your murderous competition, which in some insane moment you adopted for your business motto, far from breeding noble men, seems to be changing you rapidly into a race of nervous wrecks, grasping billionaires, and half desperate or wholly discontented workingmen, none of whom have any joy in their labor. And since such competition is wholly unnecessary among alleged rational beings, in a world that can easily be made to provide enough for all, the Rabbit is wondering how long it will take you to see your obvious danger and to change your habit.

Possibly you think the Rabbit's philosophy of your habits to be somewhat extreme; and perhaps it is. But if you think about it a moment it may suggest a truth which you have carelessly overlooked. It may serve also to emphasize this peculiar difference between men and other animals: The wild animal takes the slightest hint and modifies his ways immediately, according to the measure of his small intelligence; while the man requires a century and a revolution to change his fixed habits, and even then he follows his leaders unwillingly. So the Rabbit, who tries to understand things as they are, finds himself wondering in his brier patch, why should you call us creatures of habit and yourselves reasonable beings. Perhaps this also is a habit.

Central American Characteristics

BY CHARLES M. PEPPER

[The war which broke out in Central America last week, now happily in the way of being settled by the good offices of the United States, and the opening of the Pan-American Congress at Rio de Janeiro this week make of extreme timeliness the following article by Mr. Pepper, who is recognized as one of the authorities in the United States on Latin-American affairs, and was recently appointed by the State Department Special Pan-American Railway Commissioner of the United States.—EDITOR.]

PHYSICALLY all the countries of Central America are one. They form a geographical unity. All of them have low, damp coasts. All have volcanoes and prehistoric ruins and all of them raise coffee.

A trip thru the interior of Costa Rica is a journey thru Nicaragua or Honduras or Guatemala. The tropical vegetation is rank, luxurious and overpowering in its wealth of forest and of vine. The commerce of the interior is a commerce of bullock carts. The dwellings of the people, bamboo and palm thatched, are similar.

Yet there is a difference. Costa Rica is the home of the Spanish race almost untouched by a mixture of aboriginal Indian blood. Salvador has the native Indian race almost in its pristine condition. Nicaragua has the mingling of bloods, Spanish, Indian and negro. Guatemala, on its Atlantic slope, also has the African intermingling, tho in the interior the Indian flourishes with little of the Spaniard.

While there is this crossing of the blood, the customs, laws, institutions and traditions are similar, for they are Spanish. In that respect, as in the physical configuration, the republics of Central America are one. Furthermore, it may be said that their aspirations are the same, for these are of the Latin race. One of the leading poets and most eloquent orator in a certain republic is of pure Indian blood, but he writes and talks with a superabundant eloquence of the Latin race and its mission. The wealth of a tropical imagination finds its exuberant expression in the Castilian tongue, and that is the only thing Latin to which he can lay claim.

To the passing traveler the women of Central America seem more industrious than the men. They appear to be the real heads of the households, both as to business and as to domestic affairs. Among the poorer and the common classes the women smoke. They are best seen in the market place of any town. A group of them, with their brilliant headgear and their bright hued garments, make a real picture in color. They are very kindly among themselves.

The women of the higher classes are like their sisters in other Spanish-American countries. They are the churchgoers on Sunday, and the common sight in any town where there is a cathedral or churches is of them in their mantillas walking sedately along the streets followed by the servant with the chair, which serves them for rest during their devotions. In the afternoons they attend the bull fights and in the evening they take the customary promenade in the plaza or park while the band is playing.

Man's superiority is not merely recognized. It is welcomed. After marriage woman's seclusion and subsidence are accepted as the order ordained for the sex for all time. Weddings and christenings, with an occasional ball, form the social life. In Costa Rica there is the peculiar custom of the mother remaining at home to weep when the daughter is married, the marriage being in the church as in all Spanish countries.

San Jose, the capital of Costa Rica, is an idyllic place, up in the mountains, with a glorious view on all sides. It fairly lays claim to being a real center of inherited Spanish culture. Its big cathedral is not in the bad taste of other cathedrals that could be mentioned. Its extravagance is its Italian decorated theater, which costs nobody knows how

much. It has broad, regular streets; tiled houses; several parks with statues; and various public edifices, which are modest and in good taste. Some of the churches have mosque-like domes.

Managua, the capital of Nicaragua, is the ugliest town in Central America. It sprawls over the slopes of Lake Managua like a big spider. Its people are not offended when told that it is ugly and unfinished, because they know this and are satisfied with its being the capital. They got this privilege because of the rivalries of Leon and Granada and the revolutions which were caused by those rivalries. Having the certainty that the seat of government will continue with them the Managuans are content to wait until a period of prosperity comes and they are enabled to make their city a real capital as to architecture, parks and the like.

It would be unjust to judge the cities of Nicaragua by Managua. Granada, on the shores of Lake Nicaragua, is the most characteristic and the most Spanish. It really is a very attractive old town, a little sleepy at present, because there is to be no canal and because trade has drifted away from it. But it numbers among its citizens some fine families, and its influence in public affairs is very strong.

Leon, which is the real metropolis, is back from the Pacific port of Corinto three hours by the railway, tho the distance is only twenty-seven miles. Its most notable institutions are the cathedral and the national university. The churches are too numerous. All of them have bells and chimes, and these are set going early in the morning, too early for comfort. Leon awakes at 4 a. m. to the reveille of the troops in the garrison, the cathedral chimes, the clanging of the bells in a dozen churches, the continuous chorus of crowing roosters, the barking of countless dogs and the shrieking of the railway engine. But in spite of this it is a fine town, commercially speaking, and controls much of the trade of the whole country.

Salvador is the smallest, the most self-contained and self-content of all the Central-American Republics. Its population, which is agricultural, is as dense as in some of the European countries. Its people are industrious and unusually peaceful; they are, moveover, kindly to strangers. This trait is most apparent when a question is asked by a wayfarer who may give evidences of weariness. I was riding from the port of La Libertad to San Salvador, the capital. With a good mule it is a short day's journey. With a poor animal it seems endless. A resident of the capital was traveling with me. When we had gone about one-third of the distance, incautiously I asked at a wayside cabin if it was much further to San Salvador. "*No hay mas que alla, Señor*—just a little further on, sir." My companion laughed at me and told me it was twenty-two miles. "But they will tell you it is only a short ways wherever you ask," he said. I accepted the banter and made numerous inquiries, always receiving the same answer—that it was only a little further on—until at a cross roads which actually was five miles distant. There the woman who was interrogated said that it was quite a ways further on. And so it proved to be with jaded animals.

San Salvador is the most modern and it even may be said the most progressive of all the Central-American capitals. It is growing very rapidly, and has both commercial and political importance. It begins to look like a thriving little city in the United States, in spite of the Spanish architecture, which still predominates.

Guatemala City at one time had an ambition to be known as the Paris of Central America. Now it will be content to become a second Washington. The mountain plateau on which it lies has magnificent distances, and the town itself is not unworthy of its location. I was impressed during my visit by the number of colleges and other institutions of a national character for which edifices had been provided. The architectural taste is Grecian. The theater, a very handsome structure, might be, from its exterior appearance, of Athens, and the Temple of Minerva is reproduced in the annual fiestas or agricultural celebrations.

The higher social life of Guatemala is very secluded and is little in public evidence. This may be due to the commercial depression which at present exists and which is the result of the free use of the printing presses for creating circulating medium. Too abundant paper money has made living excessively cheap in

Guatemala, but this is no compensation for the financial crisis and the halt in industrial progress which it has caused.

Central America differs from South America in regard to the foreigners, for it has a fair proportion of North Americans or Yankees. As in various South American countries the people resent the United States monopolizing the name American, and the general term to distinguish us is Yankee, whether we come from New Orleans and the Southwest or California and the rest of the Pacific Coast. New Englanders are not known. Proximity and means of access may be the reason why the commercial opportunities in these republics have not been left to Europeans. Much of the development in all of them, especially on the Atlantic slope, is due to New Orleans enterprise; while on the Pacific side there is a very fair amount of trade controlled by San Francisco. It is also notable that these Yankees in Central America know the language of the country and are not trying to do business thru interpreters.

German interests are strong in Guatemala, and Germans are the most numerous foreigners. They control the finances and the coffee production, and have intermarried to some extent with the people of the country. It is a common saying that this or that German has annexed a coffee finca or plantation when his marriage with a Guatemala lady is announced.

Outside of Guatemala the Germans are not so many as I had thought. They do not control all Central America, as is often stated. I have been surprised at the number of French, especially in Costa Rica and Nicaragua. The French are very successful in coffee, and some of the leading commercial houses are controlled by them. The English also have railway, banking and commercial interests fully as great as the Germans in all the countries except Guatemala. But the "foreign" influence of the future, the one which will develop the enormous riches of Central America, will be the Yankee influence. That is everywhere recognized.

Guatemala City.

The Romaunt of Fair Dowsabell

BY GARNET NOEL WILEY

Three lovers had fair Dowsabell,
Three lovers, trapped with gold;
And one was slim and fair and young,
And one was dour and old;
The third was like unto a rock,
So grim he was, and cold.

Eftsoons unto the bonny youth
She gave her heart away;
But did not once, tho he would plede,
Sweet word of comfort say—
For she was loath, indeed, to send
The other twain away!

To him of eld no thought she gave,
Save pitie, eke a tear;
Ne wolde hir blode run quicker whan
The lover grim drew near,
Nathless in heart she thoght on him
With something kin to fear.

This is no tale of Dowsabell,
Ne of hir lovers three;
Noght of aventure hir befell,
Ne mayde's captivitie
At hand of lover grim, or grey,
By lover youth set free.

Nay, 'tis a parable for maydes
Who loving some trewe swain,
Forbear to speak, but not in fere
To give another pain,
But fering lest that other come
Not hir to woo again!

Ye grey olde man of Dowsabell's
Soon died, as old men should,
Ye youth 'gan seek another 'mayde—
As well ye knew he would;
Ye grim was left, and Dowsabell
Straight took whate'er she could!

Literature

Hot Weather Fiction

We may be on our p's and q's concerning matters of literary taste during the rest of the year, but the heat of July and August puts an end to intellectual pride, so that we actually prefer the kind of fiction which calls forth no effort of attention or of critical analysis.

Little of this summer reading displays any originality of outline and apparently there are not enough plots to go around. The plaintive figure of the wronged man is exploited in three recent novels, and in a dark corner of each the woman whom the impetuous hero married in a moment of youthful folly hovers like a grim Nemesis, ready to appear at the crucial moment. The only individualizing element in these novels is the local setting and the type of women who play the part of villains—a *rôle* recently accorded them by the etiquet of current fiction. *Sandpeep*[1] is a story of the New England coast. It has something of the "Jane Eyre" basis, without the mystery of the mad wife hidden in the garret, for whom this author has substituted an inconvenient actress. *The Invisible Bond*,[2] with the scene laid in Kentucky, is the usual Southern romance, in which all the men are honorable and too stupidly innocent to be natural, and all the women are brunets and good or blondes and wicked. This complexion distinction in morals is very common in Southern stories. It is difficult to fix a definite locality for *Breakers Ahead*,[3] owing to the fact that the hero spends the early part of his manhood running from his Nemesis, who in this case is a country girl, and the latter part hurrying about building up his financial and political career.

The author of *The Fortune Hunter*[4] has added too much realism to his romantic compound. Not that it is improper to make the heroine the keeper of a delicatessen, or the villain a long-haired actor in cheap New York theatres, or the hero too commonplace to be a hero, but the combination somehow bores. We read fiction to be amused, and we are consequently disgusted when, under the guise of a romance, realism rushes out to present us with fresh sausage and cheese.

Doubtless if it were not for the aenemic summer season we would not revert to our youthfully morbid taste for hissing villains, aged fathers and shrinking maidens. But these are the characters which the author of *The Golden Greyhound*[5] has dragged from the recesses of his "Diamond Dick" imagination. There is the usual rash young hero who sees the lady of his fancy passing in a hansom, and resolves to follow her at all hazards, which in this case happens to be aboard an outgoing steamer. He soon discovers, of course, that there are more cunning rascals than honest men of the ship's company. This gives him the opportunity to come magnificently to the rescue in the end, snatch the shrinking maiden from the villain, marry her and live happy ever after upon the pot of gold which was hidden in the hold of the ship. The reader will not overlook the elderly weather crank, an interesting character, who is hypodermically injected into the story and does not save it from being commonplace.

Mr. Howard's tale of tidewater Virginia[6] might have been a good horror story if he had not been afraid to take liberties with his imagination. As it is, the very words stick to the page with the prim severity of pins in a cushion. But that is not all; he insists upon giving broad hints as to the solution of the mystery. This is a mistake. Even if a man has been strangely murdered in the "shadow of the pines," the reader should be teased and baited up to the climax without being assured in every chapter of the probable result.

In spite of the heat and our literary indifference, it is with something like

[1] Sandpeep. *By Sara L. Boggs.* Boston: Little, Brown & Co. $1.50.

relief that we turn from this soda-water fiction to Alice Brown's *Court of Love*.[7] It has a piquancy of plot and an ease of expression that are refreshing. It is a charming little story of married life, which any person familiar with the absent-minded ways of a student will find pleasantly humorous. But when all is said, *The District Attorney*[8] has the advantage of the other novels mentioned in this review, since it deals with what is now the supreme American passion—muck-raking. The author marries the hero and heroine early in the story, so that there may be no distracting romantic entanglements, and then girds himself up to the political fray. The results of his assiduous raking are interesting and graphically told.

Western Culture in Eastern Lands

Vambéry's new book with title[1] gives us the result of fifty years of study and of local investigation of the subject treated. Only the Moslem world is considered. With bold strokes the author presents a vivid picture of the Russian conquest of the lower Volga districts, the Ural-Altaic tribes and Northern Asia. From the first, a kind of crusade, the religious element is still uppermost in the Russification of the people of these districts. While the author acknowledges the many advantages for which Central Asia is indebted to Russian influence, *e. g.*, the establishment in Turkestan alone of 284 schools and colleges, among which are five colleges for women, he sees her lack of ultimate success, due to the fact that her own education is but imperfectly matured (p. 121). Russia has done good work, especially among the Moslem population, yet her best efforts have often been frustrated by serious defects of administration and by official corruption, bribery and dishonest dealings (Chapters viii, ix). However, the Moslem subject has now, in judicial affairs, as conducted by Russian judges, a chance which was denied to him by those of his own faith. Unfortunately Russia shows more regard for the state than the people. And yet in spite of much shortsightedness and consequent failure as culture-bearer to the Asiatics, Vambéry says that "Russian culture is always and in every respect to be preferred to the primitive culture of the Asiatic."

The second part of the book deals with the English influence upon the Moslems. The contrast is striking. From a trading enterprise India has been made into a happy empire. It was not religious zeal which brought the English to India, nor have they tried to Christianize by force or persuasion, but rather by educational efforts have brought the enlightenment of Europe to the millions who are anxious to receive it. Judicious and honest officials have been the rule, and the civilizing influence of England has shown itself among the natives in a spirit of freedom and national pride (p. 206), the very spirit which Russian despotism has ever been driving out with the knout. The great complaint of the Hindus is that the English officials treat them *de haut en bas*, by which a mutual approach is prevented (p. 221). The Hindus, however, acknowledge that in contrast to the terrors of Russian rule and the intolerance of the Russian Church (p. 242) they have, under English rule, liberty of speech, press and religion, nor is their feeling of nationality exterminated. India is no longer "a powder magazine ready to explode," for England has driven out the greatest enemy of India—ignorance (p. 246). Vambéry believes that a friendly rivalry between Russia and England in Asia may soon make the light shine where it is now but dimly glowing.

The author shows, in the third part, that the eyes of the Moslems are no longer closed against European civilization. Moslem women authors and doctors of medicine are no longer unknown, while marriages with Christian women are not infrequent. Many Turks accuse themselves of having indolently permitted the demoralization of their people; a general awakening is beginning. According to the author, the political future of Islam depends solely upon a very strong and enlightened ruler—but he sees no hope of such a one coming to the throne (p. 353). The greatest sufferers in Mos-

[7] The Court of Love. *By Alice Brown.* Boston and New York: Houghton, Mifflin & Co. $1.50.
[8] The District Attorney. *By William Sage.* Boston: Little, Brown & Co. $1.50.
[1] Western Culture in Eastern Lands. *By Arminius Vambéry.* New York: E. P. Dutton & Co. $3.50.

lem countries are the Moslems; the Christians have the support of other Christian governments (p. 359). The fate of Persia is in the hands of Russia and England and will soon be decided (p. 368). The author regrets in the interest of humanity that distance prevents German cultural influence from appearing with its well known thoroness more quickly in Anatolia.

It would be difficult to find a more adequate commentary upon Vambéry's observations concerning British rule in India than the speeches of Lord Curzon during his seven years of rule as Governor-General.[2] Lord Curzon, it is frankly acknowledged, was not liked by the Indian people, altho none would deny the many benefits which accrued to them from his policy; financial and educational more especially, and the speeches themselves, admirable as they are, in many respects have precisely the *de haut en bas* tone which Vambéry deprecates, and which the people, especially the Eurasians, increasingly resent. To the student, not only of history, but of sociology of the human atmosphere, so to speak, of the last decade, the book is deeply interesting and extremely suggestive. Lord Curzon has introduced many reforms — he catalogs them himself in three sets of a dozen each—he has, moreover, done much to perfect and to justify many earlier and incomplete measures, and here as elsewhere has shown great toleration and absence of party feeling. One work, especially his own, claims the gratitude of all, the preservation of ancient monuments and the encouragement of native art. Apart from certain measures of permanent utility, the great Art Exhibition he organized at the Durbar of 1903 has shown the world what is real Indian art in contradistinction to the contents of the curio shops and to Occidentalized importations.

M. Aubin in his *Morocco of Today*[3] says that we are much too prone to regard the Moroccans as barbarians. He presents to us, especially in the great cities, an orderly and civilized society which lacks neither culture nor a certain kind of refinement. This society has its center in Fez with its descendants from the Andalusian Moors, who look with contempt upon the less cultured Moroccans in other cities. Fez has the advantage of many benevolent institutions kept up by charitable funds. There are fifteen schools for girls, held by educated women, besides several technical schools. The chief importance of the book is that it gives the French view of the country which France aspires to govern. Thus he attributes the recent troubles to the evil influence exerted by Sir Harry Maclean, the British officer, who reorganized the Moroccan army, on the innocent and inexperienced Sultan.

[3] Morocco of Today. *By Eugène Aubin.* New York: E. P. Dutton & Co. $2.00.

The Cotton Factory Era in North Carolina

Mr. Holland Thompson has done an excellent service to his State, and an equally good service to the industry in which North Carolina among the Southern States easily has the lead, by the scholarly work which he has put into his study of the cotton factory era in North Carolina.* From many points of view the work was well worth doing, and it has been well done; so well, in fact, that *From the Cotton Field to the Cotton Mill* may be taken as a model for social and industrial studies undertaken with a similar aim and carried out in a similar spirit. The spirit that characterizes Mr. Thompson's book is that of the trained investigator. Questions which are raising much controversy in the cotton manufacturing towns of North Carolina—such as child labor, the length of the working day in the factories, factory inspection and trade unionism — are all examined and discussed, but never from a partisan point of view. It is the standpoint from which Mr. Thompson has written that gives the book much of its value; for the controversies which the advent of the cotton industry on a modern scale have brought into North Carolina politics have been by no means confined to that State. Child labor in the South is not and ought not to be a local

* From the Cotton Field to the Cotton Mill. *By Holland Thompson,* Sometime Fellow in Columbia University. New York: The Macmillan Co. Pp. vii, 284. $1.50.

or sectional question. It concerns the United States as a whole; and since about 1900, when the movement against child labor and for a more humane factory code began, the question has assumed a national importance. The result has been that there has been much partisan writing and much misinformation has been current. There is no need for any such sensational statements. Conditions as they are described by Mr. Thompson are sufficiently bad to warrant the agitation for reform. Especially is this the case as regards child labor; for the North Carolina law as it now stands admits of children going into the cotton mills at the age of twelve; of their being employed for eleven hours a day; and of their working regularly thru the night.

There are some factory laws in North Carolina; but as Mr. Thompson shows there is no factory inspection; and without inspection it is difficult to believe that even the law excluding children from the mills until they are twelve years of age is generally or uniformly enforced. Still Mr. Thompson makes it clear that conditions in North Carolina are not nearly so backward as they have been described by visitors from the Eastern States and from England. The mill corporations pay their work people in money; there is little abuse in connection with company stores; and the schools are much better than in the rural communities whence the mill people come.

As yet there is no class consciousness among the mill people. North Carolina, like the other cotton manufacturing States in the South, is still drawing its cotton mill labor exclusively from the farms and plantations. There has been no immigration either from New England or from Europe. Conditions in North Carolina are still similar to those of the cotton towns of New England until about 1850, except that in New England there never was a class of indolent, shiftless men living on the labor of their children. But when North Carolina reaches the second generation of mill work people—a generation with no acquaintance with farm life and conditions and with little of the spirit of individualism which farm life induces—Mr. Thompson believes that a class consciousness will come, and that conditions between the mill companies and work people will be greatly changed. The relations today are, generally speaking, wholesome and pleasant. Owing to the social conditions of North Carolina and other of the Southern States, these relations are not as yet those of the factory era; and it is largely for this reason that trade unionism has failed in the Southern cotton industry. Where unionism has been tried — certainly where it has been aggressive—it has immediately been squelched by the mill superintendents, who resent the interference of trade unions—local or general—as keenly as they resent intrusion by the State into the relations existing between employers and employed.

While so far unionism has failed, Mr. Thompson holds that the inevitable struggle by the work people for a larger share of the profits of the industry must come; and that slowly the operatives will sink their individualism and independence in trade unions. "When the lesson is learned," he writes, "the unions will be powerful; for the cotton mill people are physically fearless, are native to the soil, are capable of sacrifice for an idea, and there is always the land to which they may return if beaten."

Another significant conclusion of Mr. Thompson is that it is not impossible to train negroes for cotton mill work. The difficulty of drawing on the negro population for operatives who are now so greatly needed in all the cotton mills lies in the fact that mills which recruit from the negro population must be manned exclusively by negroes; for while white men will work side by side with negroes as masons and carpenters, men and women in the South will never work at indoor occupations in close association with colored people.

Mr. Thompson's study goes back to colonial days in North Carolina. He carries it down to as recent a date as March, 1906; and not a phase of the social and industrial development of the State has escaped his careful attention. Besides the study of the cotton industry there are informing chapters dealing with present day social and religious conditions in North Carolina; and much more than local interest attaches to Mr.

Thompson's admirable presentation of all these conditions.

Studies of English Mystics: St. Margaret's Lectures. By William Ralph Inge, M. A., D. D. New York: E. P. Dutton & Co. 1906. Pp., vi, 239. $2.

It is natural that the recent trend of thought in psychology and in regard to the unsolved problems of life and a future existence should turn attention to the study of mysticism. To those who find satisfaction in the mystic's assertion of personal experience, of immediate knowledge as the basis of religious faith, as well as to those who desire to know something more of the claims of mysticism, Dr. Inge's new presentation of the subject in his *Studies of English Mystics* will undoubtedly be welcome. The present volume covers somewhat the same ground as "Christian Mysticism," in which he embodied his Bampton lectures of 1899. The "Studies," however, give a fuller account of the characters whom Dr. Inge has selected as typical of English mysticism. The range Dr. Inge has traveled is wide—extending from the anchoresses of the thirteenth century to the two mystic poets of the nineteenth—Wordsworth and Browning. That Dr. Inge has not endeavored to make his work inclusive, but has merely selected one here and one there among the many English mystics, is shown by the fact that he does not include George Fox, nor any of the early Quakers who laid so strong a stress on the "Light Within" as the true guide and illuminant of religious life. Dr. Inge treats his subject with sympathy rather than with enthusiasm, and his critical attitude toward mysticism is shown in the definition of mysticism, which he quotes with approval as "an attitude of mind which divines and moves toward the Spiritual in the common things of life." This mysticism is, but to the mystic it is far more. It is to him the direct relation of the soul with its Maker, the immediate knowledge of God, which the Quakers know as the "Light Within." Dr. Inge does justice to the true mystics in showing that mysticism is not idle or unpractical, but that it must result in a most practical doing of the will of God. The active spirit of Robert Browning or of George Fox is more the type of the mystic than is the quiet meditation of a recluse. In the literature of mysticism a place will be found for Dr. Inge's little book alongside the writings of Madame Guyon, the diaries of George Fox and of John Woolmer, the works of William Law and the Revelations of Julian.

The Pathway to Reality. Stage the First and Stage the Second. By the Rt. Hon. Richard Burdon Haldane, M. P., LL. D., K. C. New York: E. P. Dutton & Co. Pp. xix, 316; xv, 275. $3.50.

In these days of frivolous reading, it is worthy of note that a work so profound and so erudite as Mr. Haldane's *Pathway to Reality* should in the short space of three years have gone to three editions. The First Stage of the *Pathway to Reality* consists of the Gifford Lectures, delivered in St. Andrew's University in 1902-03, and the first edition appeared as soon as the course was completed. Mr. Haldane was again chosen Gifford Lecturer in 1903-04, and the Second Stage, which includes these later lectures, tho only appearing in April, 1904, was reprinted in November, 1905. Much of the charm of Mr. Haldane's work is due to the fact that the lectures were delivered *ex-tempore*, and they represent extemporaneous work of the first order. Mr. Haldane appeared before his audience carefully prepared—the lectures were not of a monotonous routine, but were the fruition of years of meditation. Thus prepared, he spoke mind to mind, recognizing the difficulties of his audience and getting into close sympathy with it, so that the intricate metaphysical concepts and deductions are made living for the reader; and tho Mr. Haldane refuses to any one an easy or lazy road to the comprehension of idealistic philosophy, yet so far no philosopher has made so clear and comprehensible an argument for the acceptance of the doctrines which have been held, with variations, by Aristotle, by Berkeley, by Kant and by Hegel. Mr. Haldane does not intend his book to be a short cut to intellectual salvation. His object in the lectures was to lead his hearers to a place where they might have some view of new regions—where they might learn to appreciate the value of metaphysics both to the intellectual and the religious life. For religion, Mr. Hal-

dane believes that a foundation in reason, and, consequently, in metaphysics, is essential—metaphysics has for its business to put the truths of religion into scientific form—and Mr. Haldane has little belief in the continued efficacy of any form of religion which sinks into emotionalism and loses touch with metaphysical truth. Rising from a perusal of Mr. Haldane's Gifford Lectures, and taking up the latest English newspaper to hand, it seems wasteful and incongruous to think of that keen and subtle intellect lavishing itself on the problem of reducing the British army by a few thousand men and of saving the taxpayers' money, while maintaining the efficiency of the service. But Mr. Haldane is not the only Cabinet Minister whose heart has seemed to be in the study rather than in the political arena, and the author of the *Pathway to Reality* can look across to the Front Opposition Bench, where the author of the "Defense of Philosophic Doubt," now relieved of the duties of the Premiership, is probably meditating new incursions into the field of philosophy.

Money and Currency. By Joseph French Johnson. Boston: Ginn & Co. $1.75.

This work does not differ in any important respect from the many books previously published upon the same subject. Unlike some of these, however, it is not controversial in character, but aims merely to present a complete exposition of the facts and principles of monetary science. As the book is intended for the use of practical men as well as for students in high schools and colleges, it contains very few technical terms or phrases commonly used in economic science, but which are not readily understood by the general reader. Professor Johnson scrupulously avoids delving into the "conjectural history" of the origin and primitive uses of money. He discusses in an able manner, however, the monetary experience of the United States. Regarding the quantity theory of money, or the effect of the volume of currency and credit upon prices, the author takes a definite stand against Professor Laughlin. Unlike the latter, he holds that "price" is influenced by changes in the volume of credit as well as the demand and supply of currency. Credit adds efficiency to money, and accordingly has the same effect upon prices as an increase in the supply of money. Professor Johnson distinguishes between commodity money (*i. e.*, metallic currency), fiat money (such as greenbacks) and credit money, consisting of promissory notes and bank checks. Not all writers on monetary science are willing to include the latter group within the definition of money. The author's conclusion regarding greenbacks—namely, that during the period of their issue they got their value from their utility as money "rather than from the Government promise they bore"—is likewise open to criticism, altho there is much evidence to support his opinion. Aside from his novel classification of the forms of money, the author contributes no additional material of any importance to the general subject of money. The bibliographies attached to every chapter of the book and a number of useful appendices are very helpful to the close student of monetary science.

The Mayor of Warwick. By Herbert M. Hopkins. Boston: Houghton, Mifflin & Co. $1.50.

Two of the latest novels bear a strong family resemblance in situation, *mise en scene* and characterization. They are "The Tower" and *The Mayor of Warwick*. In each we are made free of the green room of a college faculty cast, and secrets revealed but seldom to undergraduate eyes or to the public in general become ours. *The Mayor of Warwick* is the better, because the more interesting book of the two. Each has an extremely dictatorial Bishop, a beautiful, masterful and adulation-spoiled Bishop's daughter, a young professor and a college climate; then one has the striking figure of the Mayor, who has pushed his way up from a street-car barn to an autocratic seat in the City Hall; a very human man, not to be counted among the somewhat abstract and generalized characters who crowd the academic stage. The novel is worth while for its portraiture of this strong man, and for a genuine surprise in the working out of the plot, altho the heroine is unattractive (except to the hero!) and the politico-sociological conversations of no especial depth or value. The workman Mayor saves the book from mediocrity.

The Picture of Dorian Gray. By Oscar Wilde. New York: Brentano's. $1.50.

"All art is quite useless. . . . There is no such thing as a moral or an immoral book. Books are well written or badly written. That is all."

So says Oscar Wilde in the preface to *The Picture of Dorian Gray.* This book is well written. And it is, in spite of the dicta quoted above, an intensely moral tale. It reminds of Addison and of Hawthorne. The evil and the good in man are personified or objectified in two characters of the story—an evil genius, Lord Henry (not Harry), and a good angel, in the guise of Basil Hallward, who paints a wonderful portrait of the hero, Dorian Gray, a radiant youth of twenty. The portrait, in some strange fashion, becomes an external conscience, showing every line and expression of the change his soul suffers under the power of the tempter—apparently merely a cynical man-of-the-world—while Dorian Gray himself keeps his unsullied splendor of youthful beauty and radiant purity of face. The portrait is the faithful mirror of his soul, and, we fancy, it typifies a man's highest ideal of himself. As the ideal deteriorates under the growing power of a man's lower nature, the portrait becomes brutal and repulsive. He can no longer love the leering creature, and he seeks, as did Dorian Gray, to hide it from all eyes but his own, to deny its existence, and at last to destroy it entirely. First, vanity, then selfishness, then cruelty, then vice, and last, crime, are the steps of Dorian Gray's descent into hell. The end is horribly like that of Mr. Hyde. The working out of the details of the struggle between his two friends for the soul of Dorian Gray is done with exquisite skill—the men who tempt and who try to save are not abstractions. They are real. Yet we feel that they do typify the ceaseless struggle of the soul itself in its mysterious loneliness of sin and suffering. We have here the sure touch and the light hand of the author, but it is not a book to be read or dismissed lightly. The cleverness of its cynical persiflage somehow makes it all the more pathetic, as the effort to bear torture with a smile moves the spectator as the wildest outcry could not. The saddest thing about it is that the author could not himself profit by the lesson he teaches. Even without knowing anything of the story of his life one could not help thinking that a book written with such feeling must contain much that is autobiographical. The book is more effective now than when first published because we know now how true it is.

The House of Quiet. An Autobiography. Edited by Q. T. New York: E. P. Dutton & Co. $2.00.

The Thread of Gold. By the Author of "The House of Quiet." New York: E. P. Dutton & Co. $3.00.

Vacation presupposes leisure, and leisure is a strange word in these unrestful days, but for a certain sort of discursive essays the reader's leisure must match the author's. Such books as *The House of Quiet,* "The Road-mender" and *The Thread of Gold* do not lend themselves to a hasty reading. One must carry to them the same mood in which one seeks a friend for a "good, long talk," one in which the silences are fruitful as well as the speech. It is the twilight hour of rest and communion which we find here, hardly the noonday hour of eager life and achievement. Yet we need the cool shadow, the gentle voice saying: "Pause for a little, turn aside from the dusty highway, here is refreshment." The following passage, one of the "threads of gold," of which these essays are woven, will give a taste of their quality:

"Of course, I desire that people should be better and happier, myself among the number; but how am I to set about it? Most people's idea of being better and happier is to make other people subscribe to make them richer. They want more things to eat and drink and wear; they want success and respectability, to be sidesmen and town councillors and even Members of Parliament. Nothing is more hopelessly unimaginative than ordinary people's aims and ideas, and the aims and ideas, too, that are propounded from pulpits. I don't want people to be richer and more prosperous; I want them to be poorer and simpler. I am not a philanthropist, I suppose; but most of the philanthropists I have known have seemed to me tiresome, self-seeking people, with a taste for trying to take everything out of God's hands. I believe every one has his own circle and that one does little good outside it. I think God puts us into the world to live, not necessarily to get influence over other people."

Not in every mood will the restless and ambitious spirit welcome the gentle invitation of such books; it is not the lusty

shout of the boisterous optimist defying the world and the powers of darkness to do their worst to make him unhappy; nor is it the snarl of the cynic nor the whine of the pessimist defying God Himself to make him happy; it is a quiet voice speaking from a gentle nature and it falls with soothing cadence upon the unquiet heart. But that there are people, even in this strenuous age, who want to read peaceful and restful books is shown by the fact that *The House of Quiet,* published only two years ago, has been reprinted eight times since.

Babylonian Temple Archives. The Babylonian Expedition of the University of Pennsylvania. Vols. xiv, xv. Documents from the Temple Archives of Nippur. By Albert T. Clay. 4to. Vol. xiv, pp. xi, 86. Plates 72, xv; Vol. xv, xii, pp. 68. Plates 72, xii. Department of Archeology, University of Pennsylvania. Philadelphia Price, each, $6.00.

These are the two latest quarto volumes to appear of the extensive series promised, and of which four had previously appeared, one by Dr. Hilprecht, in two parts, one by Dr. Ranke, and two by the indefatigable Dr. Clay. The volumes are a part of the fruit of the excavations at Nippur, in Babylonia, by Dr. Peters and Dr. Haynes. Here Dr. Clay confines himself to the tablets of the Kassite dynasty which ruled Babylonia for a good part of the second chiliad B. C. The documents are all temple records of rents and receipts, relating to business life, and thus give us an insight into the sociological conditions of the times, while helping chronology and history by the dates of the royal reigns, from which we learn the length of these reigns. The proper names give us an indication of the gods worshipped, as most of the names contain the name of a god. We get an idea of the agriculture and domestic animals, as so much was paid in kind, or taxed, often month by month, as barley or dates were brought in for the support of the temple servants. Dr. Clay has made a special study of the stylus used for writing, and shows that it was not triangular, as de Morgan has held, nor square with the end cut away obliquely, but was simply square, and the writing done by impressing the corners on the wet clay. An interesting conclusion is that many of the small business tablets were originally "case tablets." The receipt was written on a small tablet, and before baking it was wrapt in a thin layer of clay, and the same document written on the envelope. This being larger gave room for the seal of the man who received the value. The man who paid it now could not alter the inner tablet (now baked) without breaking the outer one and destroying the seal. Later, if certain conditions were fulfilled, the envelope was broken and destroyed. Thus one tablet reads:

"Ninety-five *gur,* 150 *qa* of *ikbid* seed of the full tax due to Irimshu-Ninib, to be paid to Bunna-Ninib, son of Innibi. The barley he shall pay to Irimshu-Ninib, when he shall break the seal."

This has four witnesses, the name of the scribe and the date. In this case the envelope is gone with its seal. Some of the seals show the impression of gold caps on the ends very elaborately ornamented; and the impressions show what was the art at this Kassite period. The tablets treated are shown in the plates by half tones from photographs and the texts are given from Dr. Clay's autograph in other plates. There are also full indexes of names and lists of characters found in the texts. The whole work is most careful and thoro. We note, as Professor Jastrow said in our issue of June 28, that there is no evidence that the temple archives included any "library" beyond the copies of texts needed in the temple school and temple cult.

Quakerism and Politics. Essays by Isaac Sharpless, LL.D. Philadelphia: Ferris & Leach. Pp. 224. $1.25.

There is no connected plan and some repetition in the nine essays comprised in President Sharpless's little volume. This is to be attributed to the fact that each essay was written as a detached and self-contained article, and intended either for separate publication or as an address or lecture. As a whole, however, the book is a defense of the Quaker doctrines and rule of life, and an endeavor to show that liberty, peace, justice, simplicity and fidelity to the highest moral and religious obligations are compatible

with political activity and a share in municipal, State and national government. Not every one will agree with the Quakers in many matters of principle, particularly in the Quaker attitude toward war, but there are few who would not receive some stimulus and inspiration from President Sharpless's idealistic faith that he who has confidence in eternal law will not adopt any expedient which transgresses his established principles of morals. The attitude of Pennsylvania Friends in the War of the Revolution and again in the Civil War made it generally believed that Friends's principles are incompatible with the necessary business of government, and the conduct of the Quakers in withdrawing from public life gave color to the belief. President Sharpless has a twofold purpose in these essays—to defend and expound Quaker principles and to inspire the rising generation of Friends again to take their place in political life and work, and without sacrifice of their principles t bring an earnest and conscientious force to bear in the uplifting and purification of the public life of the nation.

The Americans of 1776. By James Schouler. New York: Dodd, Mead & Co. $2.00.

Mr. Schouler's book is not another narrative history of the American Revolution, but a study of the life and manners of the revolutionists. From the newspapers, magazines and pamphlets, the old letters and diaries of the time, he has made a study of the social, industrial and political phases of revolutionary history. Not deterred by the "dignity of history," the author has seized the straws floating upon the currents of colonial life and arranged them in an entertaining way. His material is not always limited to the actual revolutionary era, and we are in a considerable measure given merely a rehash of the work of Alice Marse Earle and Anne Wharton. In fact, Mr. Schouler has failed to see the larger sociological and industrial significance of his hodge-podge of facts quite as often as those two estimable women, whose methods he has imitated. The word "hodge-podge," we ought to explain, applies only to the grouping within the chapters, for the author has admirably analyzed and grouped his material under general headings, such as the following list, which is worth giving because it best describes the contents of the book. The chapter headings, with a few omissions, are as follows: "Freemen and Bondsmen"; "Crimes and Disorders"; "Births, Marriages and Deaths"; Houses and Homes"; "Dress and Diet"; "Recreations and Amusements"; "The Fine Arts"; "Philanthropy and Disease"; "Common School Education"; "Religious Influences"; "Libraries and Clubs"; "Industrial Pursuits"; "Provincial Politics." Mr. Schouler criticises the historians of the American Revolution because they have not presented these facts before, but it is the very difficulty which he has not surmounted which has led those historians to omit the little everyday affairs of colonial life in the Revolution. Their connection with the great revolutionary movement has been so difficult to point out, in any but a fanciful way, that the more philosophical historians, those with a sense for dramatic unity, and those who saw that the daily affairs would be taken for granted by the reader, have omitted them. A small boy who had been reading Dickens's "History of England" asked innocently when the English people got a chance to eat and sleep, since they were so busy fighting all the time. It was a fair question for a boy to ask regarding a history which errs so far in the direction of military history, but the average grown reader will assume that the eating and sleeping is going on without the aid of Mr. Schouler's brilliant historical imagination.

The Title-Mart. A Comedy in Three Acts. By Winston Churchill. **Whitewashing Julia.** An Original Comedy in Three Acts and an Epilog. By Henry Arthur Jones. **The Stubbornness of Geraldine** By Clyde Fitch. New York: The Macmillan Company. 75 cents each.

Here in America we are just beginning to find out that plays can be read as well as seen, and that one need not remain entirely ignorant of modern dramatic literature because he does not live in a large city. To any one with a reasonably active pictorial imagination a printed play of the right sort gives as

much enjoyment as a novel and more than seeing it acted by any but the best company. Like poetry, the plays should always be read aloud, even when one is alone, and if two or three read it together it is still more effective. Many reading clubs thruout the country have taken up courses in the modern drama, reading the plays together with the parts previously assigned to different members. Hitherto they have been practically confined to translations, especially of Ibsen, Rostand, Sudermann and Hauptmann, but now more English and some American playwrights are seeking a reading public. This will doubtless encourage them to write plays that are real literature and will stand the criticism of the library and also prevent the condemnation of a good play by the snap judgment of first-nighters. The three plays here noticed are fair representatives of the light society play now so popular, with witty dialog, amusing characterizations, a mild misunderstanding for a plot, and a conventional ending, no depth of thought, no emotions aroused and nothing to remember. Perhaps the Fitch play is the best to read on account of its two types of the American girl. Mr. Churchill satirizes the title-hunters with a cast of stock characters. Mr. Jones gives us a well-constructed play of British scandal-mongery with his characteristic somewhat gamey flavor.

Six Stars. By Nelson Lloyd. New York: Charles Scribner's Sons. $1.50.

The author of "The Soldier of the Valley" has collected his admirable short stories under the title, *Six Stars.* These tales are chronicles of a Pennsylvania village and they are charming. The people are good to know; they live quiet lives, broad and pleasant stretches of existence, like sunny meadows starred with daisies and aglow with buttercups; they are slow and ponderous, tho their fat sides shake with laughter, and they "speak reg'lar Pennsylwanyan," and play the "melodium" and sing

> "I'm a blo-hud, re-hed, ro-ho-hose,
> I love the li-hillee!"

at a posy concert to the delight of a listening world. *Six Stars* is a book to read aloud, if you can for laughter, to some appreciative listener; it is one of the pleasures that are increased by dividing. Try your audience with "The Angels of Six Stars," or "The Contentedest Man," or the adolescent adventures of Willie Calker of "The Third and a Half Generation." The book is homey and wholesome as a red-clover field in full bloom, and is just the sort of literature the nerve-weary need. It is tremulous with gentle laughter and wise with a philosophy not learned in schools, and you will not rise from reading it with a heart of hate for any fellowman.

Brief Literary Criticisms. By the late Richard Holt Hutton. New York: The Macmillan Co. $1.50.

These additional gleanings from the late R. H. Hutton's contributions to the *Spectator* are excellent specimens of the reviewer's art, with the exception of a few slight crudities of style and thought inseparable from the nature of such work. About good writing of this sort, in spite of its occasional and often hasty character, there is an immediacy, a directness of appeal which is frequently lacking to more matured and elaborate criticism. Its judgments may be off-hand; but they come hot and savory from the oven. So far, then, from there being any impropriety in the collection and preservation of such work, among the very best of which is Hutton's, there is an advantage in having it in handy shape for reading and reference; for the better it is known, the better for the standard of reviewing both among reviewers themselves and among the general public. The total number of ideas that a single brain is capable of containing is small; hence it will not astonish the reader of Hutton's writings to find him repeating certain leading notions from time to time. There is actual gain for a critic in so keeping his principles prominent. But it was surely an inadvertence on the part of the editor to reprint *in toto* an article or two which had appeared already in the "Contemporary Thoughts and Thinkers"—"Wordsworth the Man," for instance, and "Thomas Carlyle." For an example of the kind of judgment to whose succulency and flavor this rapid baking is

so favorable, the reader may be referred in particular to the articles on George Eliot and Jane Austen.

Literary Notes

ALL public libraries and generous book buyers should have the *Monthly Cumulative Book Index,* published by the H. H. Wilson Company, Minneapolis, for it is the most complete, convenient and reliable guide to the new books that we have in this country. Practically all American books are listed in it as soon as published by author, subject and title, and the price and publisher given.

....*The Tracer of Lost Persons,* by Robert W. Chambers (Appleton, $1.50), is a new and improved form of the detective story. It is a book for the hammock on a summer day, for you will be immediately interested wherever you open it, can read as long as circumstances permit, and yet stop at the end of any of the chain of tales without having the rest of the book haunting you afterwards like an unperformed duty.

....The ambition of numerous more or less educated negroes to take part in the literary development of their people, is an interesting feature, altho few of the writers have the literary skill of DuBois and Dunbar. We have half a dozen such books on our table which require simply a mention. Bishop L. J. Coppin gives the story in a series of letters, entitled *South Africa,* of his visit to South Africa in the interests of what the Colonists insist on calling Ethiopianism (A. M. E. Book Concern, Philadelphia.) It is well worth reading in view of the late uprising, and it shows the need of the religious work in whose interests the African Methodist Church has entered South Africa to the absurd alarm of the white people. *Old Greenbottom Inn and Other Stories* (Bradley & Gilbert, Louisville, Ky.), by George Marion McClellan, has for its object, in a series of tales, to tell white people in the South how negroes feel in view of their disabilities. They are vigorous, but sad, very sad—stories thoroly objective and pictorial, cheaply printed by a struggling publishing firm of colored men. *The Hindered Hand,* by Sutton E. Griggs (Orion Publishing Company, Nashville, Tenn.) is a tale of the same sad and tragic kind in which the art is subordinate to the story, killings and lynchings, and broken hearts. *Lyrics of Love,* by Charles R. Dinkins (The State Company, Columbia, S. C.) We gather from the pictures that the author was a "Boy Preacher" at the age of twelve, and the larger part of the volume is of religious verse of a crude order. From the miscellaneous titles we select a verse on "The Wife Problem":

"Never answer every breath,
She's a 'oman;
She can talk your tongue to death,
She's a 'oman;
When she's ragin', never fret;
Call her honey, call her pet;
Don't you understand her yet?
She's a 'oman."

Much more ambitious and valuable is *The Colored Regulars in the United States Army,* by Chaplain T. G. Steward, D.D. (A. M. E. Book Concern, Philadelphia), which refers briefly to the relation of negroes and to earlier American military history, and is chiefly concerned with their record in the Spanish War, during which time Chaplain Steward was in service with colored regular troops. The author has literary experience, and his record is of historical value.

Pebbles

THE peaches have such an unusual amount of fuzz on this year that eating them is more than ever like kissing a suffragist.—*Atchison Globe.*

THE bee it is a gentle thing,
But still it doth know how to sting,
And tho their work I love to see,
I always leave the honey be.
—*Cornell Widow.*

APPROPRIATE INTERJECTIONS.

FOR the tailor—Oh, scissors!
For the farmer—Good land!
For the butcher—Bah!
For the confectioner—Oh, fudge!
For the novel reader—Great Scott!
For the widow—Man alive!
For the inebriate—Great snakes!—*Atlanta Constitution.*

THE principal in one of Washington's high schools relates an incident in connection with the last commencement day of the institution mentioned. A clever girl had taken one of the principal prizes. At the close of the exercises her friends crowded about her to offer congratulations.

"Weren't you awfully afraid you wouldn't get it, Hattie," asked one, "when there were so many contestants?"

"Oh, no!" cheerily exclaimed Hattie. "Because I knew that when it came to English composition I had 'em all skinned alive!"—*Harper's Weekly.*

NEAR TO NATURE'S HEART.—A $75,000 automobile rolled thru the $60,000 bronze gates and up the $35,000 winding avenue to the $20,000 marble steps. Descending from the machine, the billionaire paused a moment to view the smiling $500,000 landscape. Across the $90,000 lawn a $125,000 silver lake lay sleeping in the shades of early evening, and beyond it rose a lordly $80,000 hill, whose crest, cloaked with forest at an expense of $200,000, glowed in the last golden rays of the setting sun. The billionaire sank luxuriously into a $2,000 ivory porch chair and rested his feet on the rosewood railing of the $160,000 veranda. "It is pleasant," he observed, "to get back to nature once in a while. After the cares and worries of the business day I certainly love to run out to this quiet little $60,000,000 country club of ours and taste a bit of simple life. It is good to keep in touch with the soil; for what is man but dust, after all!" Feeling restored, he passed in thru the $400,000 doorway to his $1,500 dinner.—*Newark News.*

Editorials

A Thunder Shower

Only an hour ago the valley was full of haymakers. The loads were being piled with magnificent skill, and one wagon after another headed for the barn. What finer sight do you know in this beautiful world than a meadow of timothy and clover, covered with dew, and filling the whole valley world with perfume; or the same meadow, mowed by machinery, raked by more machinery into huge windrows, and tossed—not yet quite dry—by muscular boys and men into great cocks, to be lifted again and carried away for storage against coming storms. Song came up from the fields, with whistling and radiant laughter.

As the storm came over the southwest edge of the horizon with distant rattling of artillery, the old farmer lifted his hands over his eyes; took a swift survey of the whole heavens; then gave a quick, sharp order that doubled the speed of men and teams. It was a grand sight, as the steel caught the cocks and the hay flew to its place on the load. Each thing worked absolutely, for it was a moment when brains came to the front. Not a false move was made. Each hand, each fork, each muscle, each driver and each team had but one will.

Every man is silent; every man is working at the utmost speed of man. The forks of toughened wood bend withelike with their strong, determined lifts. The steel, from loads to windrow, flashes in the lurid growing light. Black is the sky! Yellow the air! But the faces of the men red to suffocation! Prevenient drops! A lull! A false alarm! Bend to your forks, my men! The storm respects the brave, but the roar is above the hills, and the forests bend! Off! Off! Down the meadow! Down the lane they dash! The last load is away! Every man dashes mad after; and every tongue is loosed with joy.

It was a curious affair; a lot of power gone to waste. A good butternut tree was splintered and a barn burned. It surely was time for Franklin to interfere and put electricity into harness. A boy was eating ice cream at an open window and a splinter touched the spoon—blackened a line down the silver and sizzled in the cream. The boy did not let go. The editor sat in an eastern window, and counted the forks and flashes on the other side of the valley, and the shower swept its trail over the hills. How many more trees and houses were hit in this random play he never discovered, but on the whole he has a deepening sympathy with lightning rods. They say that beech trees are never struck by lightning (mem., plant more beech trees and recommend the tree heartily to others). But clearly the air has more ozone in it, and to breathe it is sweeter and cleaner. If in these days one might be left a bit of romance, such storms might not be so bad. Only we have now nothing but science. Thor is only the root of Thurs-day, and has not so much of a bolt at order as a common blacksmith. Edison takes the place of Zeus, and electricity is running automobiles. It is a queer affair altogether—this running a world, when professors displace the gods.

The storm had not spent its force when across the east came out two great bows of gorgeous coloring; spectra of analyzed light, and a fainter third arch. Of the greater bow, one foot stood in a farm orchard, and thru the spectrum you could see the house, glorified. And, lo, the mother came out into the violet ray and the father into the red ray, and they moved in a world transformed. Our everyday life needs but a touch to make it show otherwise to the eye, and become sublimated to the mind. Nature glorifies weeds, and weedy people. Behind the rainbow a wench becomes a goddess—therefore must we see to it that our rainbows do not arch over our common sense. No wonder these great arches were held to be the wampum belts of a pacified divinity, scrolled with promises of clearer skies and renewed good will. But in these days our Noahs are skeptics, and look in a morning paper for a "weather report" instead of into the sky for its ribbon of pacification. Is this really the same world

that our fathers inhabited? Who or what has so altered? Rainbows fortunately are only short-lived. It would not be well for us if they displaced the more sober tones of our work-a-day hours. We may, however, transfer their glories into our memories, and their influence into our characters.

The sun is still a yellow globe, in great masses of broken clouds, heavy, turbulent, savagely eloquent, but altogether terribly golden. We do not feel well on this earth except between blue and green. But now yellow masses roll hugely from West to East; unrythmical, and with only deep cracks of dark sky. So intense is the yellow that the blue is absorbed from the atmosphere, and even the grass is yellow. So the sun goes down on a yellow world, and we welcome with gladness the coming shadows of night. The robins sit high on the elms, and, looking over the West, begin to sing their vespers. As they pipe on, they pipe more assuredly, until the song sparrow trills, and the catbird, coming near the porch, sings "All is well; good night." Before daylight is quite gone the moon comes up over the Eastern horizon, and looks down into the valley with inquiries. How clean the air! How pure the moonlight! How sweet the clover! The honeysuckles invite the moths. The moonbeams are caught in millions of raindrops, that still hang on the trees.

This after-piece is the marvel; as it always is in a world of conflicting forces. The clouds broke into huge boulders, and the sky cracks grew broader, the blue more intense, until one could look thru into depths of heights that swallowed thought, and ended in faith. Then, with incredible swiftness, the masses rolled away; until now there is only blue above and green below—and the world is Home. Nature is careful of us, after all and thru all; not to tax too severely our imaginations or our fears. We are the babes of time, in the woods of the tomorrows; but we are the hopes of the world. Fear of lightning, and of the thunder as well, has been always closely associated with religious emotion. The noise and the flashing awaken a conception of divine wrath, and, consciously condemned, man imagines himself to be the object of all this unusual commotion. It is a queer bit of egotism. The clapping of thunder is only the self-applause of Nature, over the successful sanitation of the world.

But now that the air is once more purified and the world at peace, with a soft, cool breeze playing thru the valley, you see everywhere about the farmhouse doors that the families have come out to refresh themselves, drink in the ozone, and look at the sky. A thousand poems are born, altho it is not likely that one will be printed. There are not many Wordsworths scattered about the hillsides, even yet. But such poems will be woven into character, and not a few of them will reach the next generation; for it is imagination that works out the most of human progress. Beyond all, the rustic soul will see more of God. The thunder-storm still has its ethical voice and its moral mission, if only the preacher of conceits will let Nature alone, and will not dilute the word of God. Trust science to give us right vision, and tune our ears to right hearing; for right is still righteous and rightness and righteousness; and the not-right is also not righteous. The corn fields have a richer harvest, when we see that they too are dependent upon the lightning as well as the rain, for health and growth. It is a long road, but it is a sure one, that leads us to the final lesson of all living, that, "All things work together for good to those that love God."

The Russian Tragedy

The Czar of all the Russias, weak and vacillating, has done the most incredibly foolish thing that could have been expected of him. By summarily ending his own half-hearted and insincere program of constitutional government and proclaiming martial law in St. Petersburg he has destroyed the last hope of those timid apologists for him and his creatures who professed to believe that he would forestall a general revolutionary movement in Russia by the wisdom of timely reform. Henceforth every friend of liberty and of humanity must give his sympathy and, as far as possible, his active support, to the Russian revolutionary cause. He must hope that the upris-

ing of the people will be irresistible and the destruction of the old order thoro. Nicholas has chosen to complete a tragedy where he might have created freedom and order.

And yet, in our condemnation of this peculiarly contemptible specimen of imperial imbecility, we must have the philosophic justice to remember that he is as much the creature of centuries of stupidity as he is the cause of present misery. It is not his fault that he was born without will or ideas, and if he believes that the Russian people are incapable of self-government he only shares the superstition that has weighed upon the contracted minds of the self-anointed "superior classes" in all the ages. Said Emerson:

"Steam was, till the other day, the devil which we dreaded. Every pot made by any human potter or brazier had a hole in its cover, to let off the enemy, lest he should lift pot and roof and carry the house away."

And then, with that fine insight in which he has had few equals, he exposed the falsity, the superstition and the abject fear upon which all despotism rests:

"It has not fared much otherwise with higher kinds of steam. The opinion of the million was the terror of the world, and it was attempted either to dissipate it by amusing nations, or to pile it over with strata of society—a layer of soldiers, over that a layer of lords, and a king on the top; with clamps and hoops of castles, garrisons, and police. But sometimes the religious principle would get in and burst the hoops and rive every mountain laid on top of it. The Fultons and Watts of politics, believing in unity, saw that it was a power, and by satisfying it (as justice satisfies everybody), thru a different disposition of society—grouping it on a level instead of piling it into a mountain—they have combined to make of this terror the most harmless and energetic form of a state."

In Russia human nature is in no wise different from human nature in England, America and France. Public opinion which burst the bands of despotism and leveled the heaped-up mountains of unjust privilege in the age of the Stuarts and of the Georges, and swept away the ancient order of the Bourbons, will do its work of destruction again in that great empire which has slumbered thru all the centuries of Western progress. But when the work of destruction is done it will create out of the chaos, as it created in the West, a new and nobler order. In some respects it may be a finer order than was created, either in the Anglo-Saxon world or in France. For, combined with the ideals of liberty and of political equality, there will be in Russia a larger admixture of the ideals of economic equality. The Socialistic gospel, whether or not it be an adequate gospel for the ultimate redemption of mankind, is a gospel in which there is at least a large element of truth, and it has a work to do in the world. The Russian revolution will establish both personal liberty and a social order in which the principles of solidarity and public cooperation will have a large experimental opportunity.

The Russian tragedy is of today. But from the tragedies of today will spring the peace and happiness of tomorrow.

The Decay of Matter and the Decay of Theories

We are glad to be able to give our readers an article by Dr. Le Bon, the French savant, whose bold speculations as to the constitution of matter have aroused a great deal of interest and have been the subject of much controversy. It should be understood that not all of Dr. Le Bon's theories nor his experimental work are generally accepted by the scientists of the world, even of his own country. But the hypothesis he put forward nearly ten years ago, that all matter is giving off rays of "dark light," is today accepted by many who laughed at it then, altho it is yet far from being experimentally proved. It may be also that scientists of the future will deal more kindly than his contemporaries with the theory he expounds in this issue, that all matter is decaying, that the atom breaks up into radiant particles of electricity, and these change into ether waves, such as light, heat and electrical radiation, and perhaps these at last die away into quiescent ether, the Nirvana of matter, as the ripples die out on a lake. This would, of course, mean that neither of the two great generalizations of science, the laws of the conservation of matter and of energy, are strictly and ultimately true.

For the benefit of the non-scientific reader it may be desirable to distinguish

more clearly than does Dr. Le Bon between theory and its experimental foundation. It is well established that certain elements, especially radium, are disintegrating, giving off infinitesimal particles of negative electricity (electrons) and being transformed to other forms of matter of which the gas helium has been the most certainly identified. These electrons in their movement send out radiations of light and electricity, but there is no evidence that either the electrons or the energy of ether radiation are destroyed. We do not know that all the atom breaks up into electrons, nor what becomes of the positive electricity, if, indeed, that is anything more than the absence of negative electricity.

The most interesting point about these recent discoveries is that which Dr. Le Bon so graphically describes, the disclosure of the immense stores of energy inside the atom. It is really alarming to learn that a pinhead contains as much energy as a hundred-weight of dynamite, even tho there is no known way of exploding it. What if some young physicist in the Cavendish Laboratory should hit on the right kind of vibration and explode the world? We would all be instantly blown—not into atoms, no, but into electrons a thousandth as large, according to Professor Thomson, or into ether waves, according to Dr. Le Bon. Both these alternatives are almost equally unpleasant to contemplate.

Fortunately for our peace of mind Dr. Le Bon is not justified in saying that the breaking up of the atom is increased by such agencies as light, electricity and chemical reactions. On the contrary, in the case of the few rare elements, such as thorium and radium, where such disintegration is sufficiently rapid to be certainly detected, it is purely spontaneous and its rate cannot be increased or retarded by any change in the conditions, in this respect differing from all known chemical reactions or physical changes. We cannot yet stick our meddlesome fingers into the interior of this atom.

But if there is no danger that the solid earth should melt away under our feet, there is a feeling very prevalent among the general public interested in such things that the foundations of modern science are being swept away by the recent discoveries. The layman has been led to believe that such laws as gravitation, the conservation of matter and the immutability of the elements are the most certain and absolute truths of science. But now he hears reputable men of science talk calmly about the decay of matter and the transformation of one element into another, and gravely consider a theory, like the electron theory of matter, which, according to Poincaré, makes invalid two out of Newton's three laws of motion. It surprises, even shocks, him, as much as it would to have a convention of bishops discuss the question of whether there is a God, or the Supreme Court agree to set aside the Constitution of the United States, or a congress of physicians resolve that all medicine does more harm than good. He knows that the mere broaching of such heretical views in these assemblies would be met with a storm of indignation and that all the weapons of contempt, ridicule and even personal spite would be directed against the rash innovator. Therefore he is astonished and puzzled to see that in the scientific world these revolutionary theories are received with interest and even pleasure, and in the criticism to which they are subjected there is scarcely a trace of animosity. And he does not see why men of science who have accepted doctrines apparently contradictory to their former teachings do not appear shamefaced and apologetic before the public, like augurs whose tricks had been exposed.

The difficulty of the layman arises from his not understanding how a scientist looks at his science; not realizing how firmly he holds to its facts and how loosely he holds to its theories. The scientist never bothers his head with the question whether a particular theory is true or false. He considers it simply as more or less useful, more or less adequate, succinct and comprehensive. A theory is merely a tool, and he drops one theory and picks up another at will and without a thought of inconsistency, just as a carpenter drops his saw and picks up his chisel. He will say that the earth moves around the sun one moment, and the next

will revert to the theory of Chaldean astronomers, because it is more convenient, and say "the sun rises."

Really, the new discoveries are not so upsetting to science as they appear to the general public. Unexpected and revolutionary as they are, no page of millions that record the experiments and observations of science is invalidated. No man's work is proved wrong. Revolutions in science do not destroy; they extend. No chemist with the caution proper to that profession ever told his classes that the transmutation of the elements is impossible. He said that, while many things indicated that the elements were not eternal, yet from the time of the earliest alchemists to the present all attempts to change one element into another had failed. The physicist, when he stated the law of the conservation of matter, gave the evidence on which it was based, as, for example, that we had balances delicate enough to weigh a body to the sixth decimal of a gram with a plus or minus error in the seventh place, and that the most profound chemical and physical changes did not alter its weight, so if there were any variations in mass as measured by weight it was too small to be detected by the balance. And that is still literally true. If, as Dr. Le Bon and some others now believe, radium in dissociating assumes in part an imponderable form, it would require two weighings of the same bit of radium, taken with the utmost nicety at an interval of many thousand years, to detect it. As for Newton's three laws of motion, if it should be found that they do not apply to electrons, it would not be strange, for Newton never thought of applying them to electrons, which he knew nothing about.

It should be realized that all our conceptions of matter are mere hypotheses, more or less convenient for different lines of thought. The most absurd of all these hypotheses, because most easily shown to be inadequate, is our ordinary naive assumption that a body is solid, inert and impenetrable with a continuous surface and "possesses" a certain color and weight. Yet this hypothesis is sufficient for every-day purposes and for most scientific thinking. The atomic theory is more useful when we are dealing with such subjects as expansion by heat and chemical reactions, but it fails to account for such facts as that a simple atom can give off so many different light waves and that the radium atoms have an enormous supply of internal energy. Here the new electronic theory comes into play, and the atom is thought of as a sort of solar system composed of thousands of particles of negative electricity moving at terrific speed. This hypothesis is proving very fruitful, but it is still inadequate. So far positive electricity is not properly accounted for, and we have no explanation of gravitation.

Thus the progress of science is thru the invention of new and wider formulas. Mankind is ceaselessly searching for the philosophic alkahest, the universal solvent of all our intellectual difficulties. And whether we adopt the atomic hypothesis taught by Democritus 2300 years ago, that matter consists of little round hard balls moving in empty space, or the latest theory, by M. Langevin, that all space is filled with solid ether and the electrons that make up matter are merely holes in it, the holes flying around at a tremendous speed, it is purely a question of choice on the ground of utility. We know that they are both mere mental pictures constructed for our own convenience in understanding and remembering the things we have found out.. Whether we call a dog "Fido" or "Towser" depends, not on which name sounds best, but which name the dog answers to.

Gorky's First Impressions Revised

Maxim Gorky is an impressionist writer, and the theory of impressionism is that the artist's temperament and mood should color the scene he depicts. This sufficiently accounts for the conspicuous contrast between Gorky's first impressions of America and his revised version. In this way we can avoid imputing to him any conscious inconsistency or assuming that his present unflattering opinion of us is due to the fact that he now knows us better. Three months ago, when he arrived in New York, he was greeted with crowds at the pier, society people struggled for invitations to his receptions, literary *fêtes* were arranged in his honor, and there was every prospect that

he would secure an abundance of money for the Russian revolution. After a trip up Riverside Drive in an automobile and a dinner at the St. Regis, he told what he thought of America in some such words as these:

"What a marvellous country! I like to look at the faces of people I meet in the streets. They look so happy, so conscious of their rights. I hope we shall see faces like that in Russia before long, but we don't see them now. They look like a procession of mourners, the people you meet on the streets of St. Petersburg and Moscow in these days of sorrow and suffering. Even the squirrels and the little gray birds in the park seem to realize that they, too, have a right under your Constitution to life, liberty and the pursuit of happiness. In a Russian city almost every other man one meets is either a soldier or a policeman. I haven't seen a single soldier all day and only two policemen. Marvellous! And your gigantic buildings of stone and iron, kissing the clouds, I want to know how they are made."

And now, after a social rebuff on account of his matrimonial irregularities, disappointed in his hopes of securing funds for his cause, his lectures unprofitably attended, and his articles unpublished, this is the way the same scene looks to him:

"Everywhere we see around us the work of the mind which has made of human life a sort of hell, a senseless treadmill of labor, but nowhere do we feel the beauty of free creation, the disinterested work of the spirit which beautifies life with imperishable flowers of life-giving cheer.

"Far out on the shore, silent and dark 'sky-scrapers' are outlined against the fog. Rectangular, with no desire to be beautiful, these dull, heavy piles rise up into the sky, stern, cheerless, and morose. In the windows of these prisons there are no flowers, and no children are anywhere seen. These structures elevate the price of land to hights as lofty as their tops, but debase the taste to depths as low as their foundations. It is always so. In great houses dwell small people.

"From afar the city looks like a huge jaw with black, uneven teeth. It belches forth clouds of smoke into the sky, and sniffs like a glutton suffering from overcorpulency. When you enter it you feel that you have fallen into a stomach of brick and iron which swallows up millions of people, and churns, grinds, and digests them.

"The people walk along the pavements. They push hurriedly forward, all hastily driven by the same force that enslaves them. But their faces are calm, their hearts do not feel the misfortune of being slaves; indeed, by a tragic self-conceit they yet feel themselves its masters. In their eyes gleams a consciousness of independence, but they do not know it is but the sorry independence of the axe in the hands of the woodman, of the hammer in the hands of the blacksmith. This liberty is the tool in the hands of the yellow devil—gold. Inner freedom, freedom of the heart and soul, is not seen in their energetic countenances. This energy without liberty is like the glitter of a new knife which has not yet had time to be dulled, it is like the gloss of a new rope.

"It is the first time that I have seen such a huge city monster; nowhere have the people appeared to me so unfortunate, so thoroughly enslaved to life, as in New York.

Mr. Pyeshkoff, when he first began to write, adopted a pen-name meaning "bitter." If he continues to grow more pessimistic he should change it to "Gorky-er" or "Gorky-est," or whatever the corresponding Russian terms are. But we hope that before long the clouds will lift from Russia, so that when he returns to his native land, St. Petersburg may seem as smiling to him as New York once did.

Railway Rebates and Earnings

GREATLY increased railroad earnings are the subject of discussion in financial journals. It is agreed that the twelve months ending with June were our railroad companies' banner year. Growth was larger, however, in the second half than in the first. *Bradstreet's* estimates the increase in gross for the eleven months ending with May at 12 per cent., and the increase in net for the same months at more than 16 per cent.

But higher rates of increase are seen when only the five months beginning with January last are considered—14.7 per cent. in gross and even 29 per cent. in net. As the June returns (not yet complete) were more favorable than May's, it is reasonably estimated that the fiscal year's gross earnings were greater by about $250,000,000 than those of 1905 (making a total exceeding $2,320,000,000) and that the net earnings $689,592,000 in 1905) were not less than $800,000,000.

These increases were due in part to a discontinuance of rebating and of freight-rate favoritism in other forms. There has not been much rebating since June of last year, and there has been very little since last December. Shippers who formerly received rebates or unlawful concessions in rates have been paying the regular and published charges. As a rule, this change has not been accompanied by any reduction of these regular

rates. We have heard of one exception. It is reported that Mr. Stickney, president of the Chicago Great Western, having abolished all rebates, made a general reduction, saying that it did not decrease his company's revenue. It is also said that he was urged by two prominent competitors to restore the old rates, because they were unwilling to follow his example. Obviously, if rebating has been given up, and if everybody has been required to pay the regular and published rates, revenues generally have been increased.

How much have the rebates amounted to? Of course, no one can get a full record of them. We mention several estimates reported in the financial pages of prominent daily journals to have been made by railroad officers, whose names, with one exception, are not given. One officer, it is asserted, expressed the opinion that rebates had amounted to 5 per cent. of the total gross earnings. This, on the basis of last year's returns, would be about $100,000,000 a year. Others are said to have placed the average at somewhat lower figures. It is reported that one president recently said that 15 per cent. would be added to his road's receipts by an entire discontinuance of rebating. An estimate that rebates have exceeded $50,000,000 a year is attributed to Mr. Ramsey, formerly president of the Wabash road.

In the financial columns of a conservative daily journal we read a few days ago the following:

"One well-known railroad president said last week that in the past the rebates granted by one railroad about whose affairs he was personally informed amounted to fully 10 per cent. of the road's gross earnings. He pointed out that the abolition of rebates was an event of great importance to railroad stockholders. It is interesting to recall that some months ago a movement was under way among a number of railroads in the Central West to make a reduction of about 10 per cent. in the rates on a large number of commodities, for the purpose, it was privately explained, of giving to certain shippers as low rates as they had actually enjoyed while rebates were allowed."

In a recent letter from the Chicago financial correspondent of a New York daily of good reputation, it is asserted that "a million dollars a month has been saved by the railroads of the West for the past six months by a discontinuance of rebates and a withdrawal of special secret tariffs."

Railroad officers do not, of course, tell the public just how much their companies have been paying to favored shippers. The many anonymous statements in print, which we have read, point to an annual total somewhere between $50,000,000 and $100,000,000. A discontinuance of such payments must largely increase the net earnings, if general rates are not at the same time reduced. This may account for a considerable part of that increase of earnings to which we have directed attention, an increase which has led to several recent increases of dividend rates. The remainder of the increase has been due to the prevailing prosperity and industrial activity. The agreement of many roads that they would no longer issue free passes has also increased their revenues. It is said that the Pennsylvania Company's passes in the State of Pennsylvania alone represented about $1,000,000 worth of transportation every year.

If the revenues of the railroads have been so considerably increased by giving up those practices which were prohibited by law, it is reasonable to expect that shippers will now ask for some reduction of the rates which all must pay. Average freight earnings per ton per mile declined steadily until 1899; since that year they have been rising slowly. Commissioner Prouty says the tendency hereafter will be downward again, not owing "to any extensive or sweeping reductions ordered by the Commission, but rather to the fact that the railways themselves, having knowledge that the reasonableness of their action may be challenged, will hesitate to make the advances which they otherwise would, and will grant the demands of shippers for reductions, which they otherwise would not." If Mr. Prouty expects that the Commission will not have to hear demands for a reduction of some general rates, he will be disappointed.

An Historic Parallel

WHILE all the philosophical students of current history are hammering out the parallels between the events of the French Revolution and the current revo-

lution in Russia they have failed to observe a parallel nearer home which has been discovered by Mr. Upton Sinclair. He thus writes us:

> Recently I was conversing with an English gentleman who has been a deep student of our political affairs, and I explained to him my idea of what the immediate future held in store for America. I said that my views were the fruit of a two years' study of the period of our history immediately preceding the Civil War; that I had read exhaustively in the contemporary literature, and, being a novelist, had read imaginatively; that is, had tried to put myself in the attitude of the people of that time, and to see with them the events as they arose day by day. I said that I had found myself continually trying to interpret the events of the present day in the same light; trying to imagine how the news of my own daily paper would have seemed to the different men of that period, and what part they would have played had they been alive today. My English friend found this an interesting point of view, and asked me to write out and publish somewhere the parallel which I gave between the public men of the present and the past. I have put it into the form of a table. Of cou.se, it must be understood that such a comparison must not be taken too literally; that one must not expect a resemblance in external detail.

The Type.	Chattel Slavery. (1846-1863.)	Wage Slavery. (1893-1914.)
The Conservative Reformer	Daniel Webster.	Grover Cleveland.
The Unwilling Prophet	John C. Calhoun.	Marcus A. Hanna.
The Great Compromiser	Henry Clay.	Theodore Roosevelt.
The Timid Conservative	Edward Everett.	Alton B. Parker.
The Editor of Radicalism	Horace Greeley.	Arthur Brisbane.
The Statesman of Radicalism	Charles Sumner.	Wm. J. Bryan.
The Politician of Radicalism	Wm. H. Seward.	Robt. M. LaFollette.
The Agitator of the Revolt	Wm. Lloyd Garrison.	Geo. D. Herron.
The Orator of the Revolt	Wendell Phillips.	Eugene V. Debs.
The Martyr of the Revolt	John Brown.	Charles H. Moyer(?).
The Voice of the Victim	Frederick Douglass.	Jack London.
The Compromising Reactionist	Stephen A. Douglas.	John C. Spooner.
The Aggressive Reactionist	Jefferson Davis.	Nelson W. Aldrich.
The Organizer of Reaction	Wm. Lowndes Yancey.	David M. Parry.
The Last Figurehead	James Buchanan (1856).	Charles Warren Fairbanks (1908).
The Untried Hope	Abraham Lincoln (1860).	Wm. Randolph Hearst (1912).
The Novelist of the Revolt	Harriet Beecher Stowe.	Upton Sinclair.

One blazing parallel Mr. Sinclair's modesty did not allow him to mention, but it will occur to every one else:

The names in the two columns are fairly well known. It may be well to mention that Mr. Brisbane is editor of Mr. Hearst's *Evening Journal;* that Charles H. Moyer is in prison for murdering Governor Steunenberg, of Idaho; and that David M. Parry is the founder and ex-President of the National Association of Manufacturers.

Mr. Sinclair says well that we must not expect in his parallels "a resemblance in external details." Indeed it will not always be easy to see the resemblance even when thus pointed out. Daniel Webster is not much remembered now as a "conservative reformer." We should rather have thought of such a man as Henry Winter Davis. Some will smile at the comparisons of the puritanical Garrison with Professor Herron, or of Wendell Phillips as an orator with Eugene V. Debs. And as to putting Charles H. Moyer against John Brown —well, we will wait forty years first. But last and chief of all. "Abraham Lincoln; William Randolph Hearst!" It is well that we are told not to expect a resemblance in external details — but where does the resemblance lie? It lies in an "untried hope," and for that also we will wait till "1912."

But these are details of little worth. The glaring assumption is that the wrongs, the "slavery," of the workmen in the unions, indeed of all who labor with hand or brain for wages, is comparable in its enormity with that of chattel slavery before the Civil War. All such descriptions of the wage system as "slavery" involve an enormous stretch of rhetorical exaggeration which can hardly deceive those who indulge in it, altho no less a philosopher than Herbert Spencer, the arch enemy of socialism, did not disdain the comparison. The Independent sees evils, great evils, in our wage system prevalent the world over, and we sympathize with the Socialists and every one else who is trying to correct them. But these evils are not, so far as we can see, essential to it; they

are being corrected. Slavery had to be totally abolished because it was utterly bad and incurable. Our wage system we do not expect to be replaced by socialism, which means the assumption of all productive wealth and all production by the State — at least not in the lifetime of the living. This essential difference between the two "wars" is what makes the very comparison seem farcical, even as the comparison of the names chosen excites a smile.

Blindness and the Marriage of Relatives

THERE is an impression prone to be somewhat generally entertained that the old-time ecclesiastical regulations prohibiting the marriage of relatives by blood within certain degrees of kindred are founded on somewhat imaginary fears of possible physical danger to the offspring or certain ethical prejudices which we are supposed to be outgrowing in modern life. It has been known, however, for a good while that the study of the statistics of those born deaf in this country shows that this unfortunate condition is much more likely to occur when the parents are nearly related by blood than in other cases. The difference is so striking that a number of excellent authorities who have devoted serious consideration to the statistics do not hesitate to say that this fact alone is quite sufficient to show that the old-time prohibitions of marriage among near relatives are founded on the best possible evidence of tendencies to hereditary degeneration in the offspring which are quite sufficient to justify even more trenchant measures than the ecclesiastical authorities have ever deemed it wise to take.

Dr. Alexander Graham Bell, in a recent special census report on the blind and deaf of this country, has made it very clear that this principle of hereditary degeneration in the offspring of nearly related persons is quite as true with regard to blindness as it is for deafness. He has established beyond all doubt that the marriage of cousins, by which, of course, he means cousins german, or first cousins, is much more likely to be followed by the occurrence of congenital blindness in some of the offspring than where such relationship does not exist. In about 5 per cent. of the cases of blindness in the country the parents of the unfortunates were cousins. Of the blind whose parents were thus nearly related about one in four had been born blind, while among the blind whose parents were not cousins the proportion of the congenitally blind was somewhat less than one in fifteen. This makes it very clear that it is the close blood relationship which has a definite influence in producing the sad congenital defect that so handicaps the offspring for the whole of life.

The theory on which the occurrence of this hereditary defect is usually explained is now pretty generally admitted. Where defects exist in a particular family strain these are emphasized in the next generation if marriage is contracted with families that have shown signs of a similar defect. The more alike near relatives are the more risk is there that their offspring will be seriously defective in some important point of organization. When near relatives, as is not infrequently the case, are very different from one another physically, then the danger is much less, tho it is not entirely absent. There is a well-known tendency for offspring in exceptional cases to represent not the immediate parents, but the second or third generation of their ancestors. It is perfectly possible for a man who has or at least exhibits none of the peculiar physical traits of his father or grandfather yet to prove the instrument for the conveyance of their traits to a succeeding generation. For individual cases, then, no care in the selection of near relatives in marriage will entirely obviate the risk of hereditary defect because of similarity of family strains.

There is, of course, a very important social and economic lesson contained in these statistics of Dr. Bell. Nothing is the source of more unhappiness for parents than to have their offspring defective in some such serious way as blindness or deafness. On the other hand, such defectives are almost sure to become, to some extent at least, and most of them, entirely, a burden upon the State. It is important, then, that all

risk in the matter should be avoided. Unfortunately at the present time considerably less than one-half of the States of the Union, under twenty we believe, forbid by law the marriage of first cousins. The principle of allowing as much liberty as possible to the individual has so far prevented the enactment of prohibitory statutes in other States. This appears to be unfortunate, since here is evidently a law that is founded on the nature of things and should receive the approval of legal enactment. In the meantime it seems well to recall the fact that these old ecclesiastical regulations, so often contemned, are founded on carefully collated human experience, and that the modern attitude which is so apt to consider them old-fashioned limitations of individual liberty, is a serious mistake likely to be fraught with lamentable consequences if indulged.

Russell Sage

Russell Sage had various ambitions, but the chief one was to be rich, and that he gained—eighty millions, they say. He could have done many other things, and he did other things well. He ran for Congress three times; the first time he was defeated; the second time he just squeezed in; and the third time he had seven thousand majority. That shows what he might have gained if he had decided to remain in politics; but he could not afford to; for, much as he loved that life, it interfered with his stronger desire to get rich; and so he left the successful work of a party boss to be a boss of Wall Street. Thus he added dollar to dollar, million to million. Quiet, retiring, honest as business goes, and happy in ceaseless work. He took no vacation—never took a vacation, and told the readers of THE INDEPENDENT in our Vacation Number two years ago, in an article that was widely discussed at the time, why he did not believe in vacations, but in ceaseless work. He was thrifty, had no generous vices, was a model husband, kept no yacht, played no races, tho he loved a fast horse. And he lived this life of steady work till his ninetieth year. The papers loved to make mild fun of his economies, his frugal lunch, and now they tell that he gave judiciously, never lavishly, in charity, and once, in honor of his wife, a hundred thousand dollars to a school. Had he dreams of large beneficence, and did he amass money that he might give it more largely when he could no longer increase the amount; and was it his loyal wish that his gifts should go as those of his wife, even as so much Gould money goes as the gift of a daughter? Who knows? He may have had these dreams, but his philanthropy was not in evidence; it was like so many people's religion, in his wife's name. He leaves no children, and his wife will dispose of his wealth, if legal contests do not prevent. Much better is the Carnegie way to give while you live. But Russell Sage and Alfred Beit could not see the better way.

Filipino Questions

The Philippine paper *El Renacimiento* is published in two languages, half in Spanish and half in Tagolog, and it represents the longing for independence and opposition to American rule. We find one leading editorial addressed in English to THE INDEPENDENT, and it ventures three reasons why American capital is timid about entering the Philippines and asks us what we think of them. The first is because the United States will not set a time when it will allow independence. We cannot see that setting a time would make capital less timid; possibly it would make it more so. Frankly we do not believe it would be better for the Philippines to be independent. What we would like is to give the Islands a government like that of American Territories, and ultimately that of our States, but we find few as radical and hopeful as we are. The second reason assigned is because our Congress refuses to give a free market to the products of the Islands. That reason is good, and we are ashamed of Congress. The third reason is that the American government of the Islands is expensive, not to say extravagant. Possibly, but we do not believe that this is keeping out American money. It is more likely to displease the Filipino people who want offices now given to Americans.

The Challenge Accepted

The inevitable has been reached, and the Duma, dissolved by order of the Czar for trenching on his prerogatives, has accepted the challenge and declared war; for the meeting in Finland, after being prorogued, and the declaration that no foreign or domestic loan will be recognized, and that no taxes should be paid, is a declaration of war. At present, for a few days, the power is with the Czar and his advisers; but quiet cannot last long. When the people are agreed not to pay taxes, and the Government cannot borrow money, and Russian securities are falling in the market, and the soldiers, the only hope of the Government, are getting more uneasy every day, there is hardly needed the violent outbreak, which yet will surely come in a hundred places. The sympathy of the world was expressed by the British Premier in the Interparliamentary Conference, when he said: "The Duma is dead; long live the Duma!" Some criticise his words as if they were far from discreet or diplomatic. But what did he say other than what the Czar himself said, when he dissolved this Duma, and promised to convoke another. To be sure, his words met a response from those who heard as expressing sympathy with the members of the Duma who had fled to Viborg, but technically the speaker was quite correct. We may now expect a period of severe repression, many arrests and imprisonments, but they will only hasten the final crisis, when the Czar and his family will be lucky if they can escape to a quiet retreat in Denmark, and Russia can try her experiment of self-government.

All the enterprising, dashing, reckless enthusiasts with some money and no special initiative, are one after another flying a balloon; we hear of an ascent and a tumble into the bay almost any day. But all this toying with dirigible balloons amounts to nothing practically. A gas balloon, no matter how steered, is bungling and uncontrollable in its own nature, as well as dangerous. What the instructed enthusiasts should work for is the airship without any balloon. An albatross carries no gas. A bumble-bee needs no hydrogen. A bat finds his vans sufficient. The men like Langley and Bell and the Wright brothers are on the right track, and we must wait till some one of them, in a very simple way, learns how to do what any common house-fly or stupid baby gull finds perfectly easy. It will come before long.

The nationalization of all Japanese industries is a newspaper illusion. Japan does take over the principal profitable railroads, and may take over more. All that is now anticipated further is that the Government will aid companies to open mines, railways and forests in Manchuria and perhaps in Korea. Similar loans, properly guaranteed, will be made, perhaps, to companies and trusts which will export textiles and other goods to Manchuria and Korea. The object does not seem to be so much to "nationalize" these industries, as it is to capture the commerce from Japan, while maintaining the open door. Japan means that having the advantage of neighborhood she shall not lose it by lack of money and enterprise. This will give foreign merchants something to think of.

Just as we go to press a cable comes to us from Mr. Hayne Davis, our Special Representative at the Interparliamentary Union now meeting in London, to the effect that the Congress has taken a bolder and more progressive stand than any previous Congress, and that the American propositions have achieved a complete victory. These propositions, our readers will remember, were the adoption of a model arbitrary treaty and the extension of the Hague Court to embrace an international legislature. Mr. Davis will give the readers of THE INDEPENDENT a full report of this Congress as soon as possible.

Apropos of the death of Ibsen it is recalled that when his play "Ghosts" was first given in 1892 at the Argentina Theater in Rome the audience mobbed the manager because he did not produce the expected specter.

Insurance

The Mutual's Ticket

LAST week Wednesday, on the last day in which the law allowed the names to be filed, the "Administration" ticket of the Mutual Life Insurance Company was named to be voted on at the December elections. The ticket contained a sensation in the names of four members of the International Policy-holders' Committee, which committee was established principally to oust the present management from the Mutual and the New York Life. The four men were Judge George Gray, of Delaware; Gen. Benjamin F. Tracy, of New York; H. W. Higginbotham, of Chicago, and Col. A. N. Shook, of Nashville. These four men were greatly annoyed at having their names put on the ticket, especially as they were not consulted beforehand, and they all telegraphed their refusal to serve. But James McKeen, the new counsel of the Mutual, says there is no provision in the law for them to be stricken off and they will have to go to the policy-holders to be voted on.

Mr. Rogers and Mr. William Rockefeller are not renominated. They both, however, sent letters to President Peabody explaining their reasons for resigning. The Administration ticket is as follows:

DIRECTORS FROM M'CURDY REGIME.

George F. Baker, John W. Auchincloss, Dumont Clarke, Frederic Cromwell, Julien T. Davies, Charles D. Dickey, William P. Dixon, Charles R. Henderson, James N. Jarvie, Augustus D. Juilliard, Charles Lanier, Theodore Mofford, William H. Truesdale, H. McK. Twombly, Cornelius Vanderbilt.

DIRECTORS SINCE M'CURDY RETIRED.

Hugo Baring, Charles S. Brown, Emory McClintock, William C. Macmillan, George P. Miller, Charles A. Peabody, Henry Phipps, LeRoy Springs, Louis Stern.

NEW NOMINATIONS.

Cyrus Curtis, H. Rieman Duval, Judge George Gray, Harlow N. Higginbotham, William H. Lambert, Sir Hiram Stevens Maxim, Thomas M. Mulry, Emile Oscar Phillipi, George C. Rand, Henry W. Taft, Gen. Benjamin F. Tracy, Col. Alfred N. Shook.

Mr. Rogers's letter to Mr. Peabody on retiring has generally been considered indiscreet. He not only says that he has a policy on his life for $100,000, "which has already cost me more than that amount in premiums," and denies that he caused the election of Mr. Peabody to the presidency, which seems to imply that his sponsorship would make President Peabody's position impossible, but he also practically confesses that the general prejudice against the officials of the Standard Oil Company when acting in any fiduciary capacity, is so great that it is best for him to retire as trustee.

We think that the action of the Mutual Life in putting these four men from the International Policy-holders' Committee on the administration ticket is a mistake, as it tends to confirm the policy-holders, who are now in no mood to be juggled with, in their hostility to the present officers of the company.

Still, on the whole, the insurance situation is improving. The laws passed at Albany at the recent session have put an effective referendum in the hands of the policy-holders, and when the opposition ticket is put in the field there will be a good chance for the policy-holders to elect the best men.

....The Mercantile National Bank, of which Frederick B. Schenck is president, has moved to new and enlarged quarters in the Western Union Building, 195 Broadway, just opposite the old location. The capital of the Mercantile is $3,000,000, and its surplus more than $4,500,000.

....Walter Seth Logan, the well known lawyer, who died last week, was graduated from Yale University in 1870, and was for many years president of the Sons of the American Revolution and the American Scenic and Historic Preservation Society. He was also a member of many other clubs and societies, including the Peace Society. At his funeral on Sunday last at the Central Presbyterian Church, in West Fifty-seventh street, Rev. Mr. Harmon conducted the service, and John DeWitt Warner pronounced a eulogy. The pall bearers were John DeWitt Warner, Charles W. Dayton, Col. John C. Calhoun, Donald McLean, Prof. George A. Treadwell, Charles H. Nettleton, Edward T. Howard and Frederick S. Lamb.

Financial

Foreign Trade of the Year

OFFICIAL reports of our foreign trade for the fiscal year ending on June 30th show that high records have again been broken in exports as well as in imports, the sum of both falling only $30,000,000 below $3,000,000,000. Before the annexation of Porto Rico and Hawaii our trade with them was included in our foreign commerce; if it should be placed there now the total would considerably exceed $3,000,000,000. When compared with those of 1905, the exports of the year just completed ($1,743,763,612) show an increase of $225,000,000. The imports ($1,226,615,379) exceed those of 1905 by $109,000,000. The excess of exports over imports ($517,000,000) is greater than in any other year since 1901. Below are shown the totals for the last twelve years:

Fiscal year.	Exports.	Imports.	Excess of Exports.
1906..	$1,743,763,612	$1,226,615,379	$517,148,233
1905..	1,518,561,666	1,117,513,071	401,048,595
1904..	1,460,827,271	991,087,371	469,739,900
1903..	1,420,141,679	1,025,719,237	394,422,422
1902..	1,381,719,401	903,320,948	478,398,453
1901..	1,487,764,991	823,172,165	664,592,826
1900..	1,394,483,082	849,941,184	544,541,898
1899..	1,227,023,302	697,148,489	529,874,813
1898..	1,231,482,330	616,049,654	615,432,676
1897..	1,050,993,556	764,730,412	286,263,144
1896..	882,606,938	779,724,674	102,882,264
1895..	807,538,165	731,969,965	75,568,200

Imports of gold coin and bullion exceeded imports by $57,653,000, but in the case of silver the exports were greater than the imports by $21,446,000. Returns in detail are not yet available, except with respect to exports of agricultural products. These exceeded the similar exports of 1905 in value by nearly $140,000,000, the total being $890,578,504. Cotton leads the list, with $400,426,967, which is the highest record for exports of this staple. Last year a larger quantity yielded only $379,000,000. Going back we do not find (except in 1905) a larger number of bales sold abroad until we reach 1899, and it is noticeable that altho the exports were greater in quantity then by 5 per cent., the sum received for them ($209,500,000) was only a little more than half as large as the receipts in the year just ended. We sold abroad 97,000,000 bushels of wheat (flour included), which was more than twice as much as was exported in 1905, but far below the annual average of 212,000,000 for the six years ending with 1903. The total for breadstuffs, however ($177,350,000), is greater than the similar total in 1905 by $76,000,000.

* * *

....The issue of $30,000,000 of Panama 2 per cent. bonds was accomplished last week with marked success. There were nearly 2,000 bids, and the allotments enable the Government to realize an average of about 104. To Fisk & Robinson of this city one-half of the entire issue is awarded at prices averaging a shade above 104; the Merchants National Bank, of Philadelphia, gets $3,000,000 for a price slightly higher; $5,819,580 is allotted to Samuel Byerley, of this city, whose principals are not yet known, at prices ranging from 103.867 to 104.125; and the remainder is given in small amounts to several national banks and individuals, one man paying 125 for a small bond which is to be No. 1 of the series. These bonds are to be used chiefly by national banks as security for circulation and deposits of public money. An extraordinary price was realized, owing partly to Secretary Shaw's promise that he would deposit (upon bond security) with a national bank bidding 103½ or better a sum equal to one-third of its bid. The unsuccessful bids at 103½ or better amounted to about $11,000,000.

....The Bank of New York, of which Herbert L. Griggs is president, has transferred $1,500,000 to the surplus fund, making the surplus $2,500,000. With its surplus at $1,000,000, as formerly, the Bank of New York could make single loans not exceeding $300,000 in amount, but with the surplus raised to $2,500,000, loans of $450,000 may be made.

....Dividends announced:

Trenton Potteries Co. (Preferred), 2 per cent., payable July 25.

Helena Light & R'way Co. (Preferred), 1¼ per cent., payable July 31.

John B. Stetson Co. (Preferred), 4 per cent. semi-annual, payable July 14.

John B. Stetson Co. (Common), (ad interim), 10 per cent., payable July 14.

N. Y. Dock Co. (1st Mort. Coupons), payable August 1st.

Atch., Top. & S. F. Rway (Serial Debenture 4s), coupons, payable August 1st.

Am. Locomotive Co. (Common), quarterly, 1¼%, payable August 25th.

Lord & Taylor (Common), quarterly, 1¾%, payable August 1st.

The Independent

VOL. LXI NEW YORK, THURSDAY, AUGUST 2, 1906 No. 3009

Survey of the World

Political Movements

In its appeal for subscriptions to the campaign fund, the Republican Congressional Committee says that the campaign "must be based on the administrative and legislative record of the party, and that being so, Theodore Roosevelt's personality must be a central figure and his achievements a central thought." Elmer Dover, secretary of the National Committee, remarks that it would not be wise to make tariff stand-patism a national issue, because local conditions should be considered. There is in many places, he adds, a demand for revision; some Republicans will be elected upon revision platforms, others on platforms in which revision is opposed. He would not be surprised if a tariff investigation should be made after the coming session by a commission appointed by the President or a joint committee of Congress.——Among the interesting local contests is the one in Mr. Littlefield's district in Maine, where his re-election is opposed by the Federation of Labor. Correspondents in the field say that he will not lose many labor votes, because a large majority of the labor men are already Democrats. But his plurality of 5,500 will be considerably reduced, it is predicted, mainly because of the liquor question, as he is identified with the supporters of the new law for the establishment of a commission to enforce the prohibition statutes.——In New Hampshire, Winston Churchill, the novelist, as the candidate (for Governor) of the Lincoln Republican Club or Party, is making speeches in which he sharply attacks the Boston and Maine Railroad Company, asserting that it has been controlling the legislation and politics of the State. Government by railroads, he says, is the greatest political evil of the present time. ——Owing to reports that Mr. Roosevelt would make several speeches in Pennsylvania in behalf of the regular Republican ticket, it has been authoritatively announced that he will make no political speeches there, but will keep his engagements to make addresses, on October 4, at the dedication of the Capitol and at the York County Fair. Lewis Emery, Jr., nominated for Governor by a fusion of the Democrats and the Lincoln Republicans, in his letter of acceptance calls for a strict regulation of corporations, a merit system in the public service, freight and express rights for trolley roads, a rate of 2 cents a mile for railway passenger service, and a reference of the election of United States Senators to the people.——Senator Bailey, of Texas, has been renominated at the primaries. Owing to similar action in Arkansas, Kentucky, Oregon, Louisiana and several other States, about one-third of the thirty senatorial vacancies occurring next year will be filled by what will virtually be popular elections.——In New York there is a decided movement on the Republican side for the nomination for Governor of Mr. Hughes, counsel for the Armstrong Committee during the recent insurance investigation. For a long time the present Governor, Mr. Higgins, was unwilling that such an investigation should be made. On the Democratic side Mr. Hearst, according to current reports, has a considerable number of delegates, altho he is the candidate of the Independence League. Ex-Judge Alton B. Parker (formerly candidate for the

Presidency) probably represents the Democratic opposition to Mr. Hearst in a long interview, in which, after commending a dozen other possible Democratic candidates, he says, in response to the suggestion that Mr. Hearst seeks by means of the League to compel the Democrats to accept him: "He is too shrewd a man to believe it possible that a Democratic convention will ever be made up of delegates so absolutely pusillanimous as to surrender to one demanding that the party shall deliver up to him the honor and power he covets, or suffer defeat." The city authorities having asked that the ballot boxes used at the mayoralty election be emptied and the ballots destroyed, Mr. Hearst says to the court that he will provide new boxes if an order shall be issued for the preservation of the old ones, with their contents, to await the result of his application to the next Legislature for a recount.——Mr. Gompers asks every member of the Federation of Labor to contribute $1 to a fund for use in support of labor candidates in the Congressional campaign.——Harry H. Bender, Fiscal Supervisor of State Charities in New York, has been found guilty by the Civil Service Commission of using the influence of his office to induce contributions to the Republican campaign fund, and the Commission has reported its findings to Governor Higgins.

The Galapagos Islands

In Ecuador, newspapers representing the Government have published the following memorandum relating to negotiations for the sale of the Galapagos Islands, which was found among the private papers of ex-President Garcia:

"While at Washington I visited President Roosevelt and inquired into the question whether the United States was disposed to take over the Galapagos Islands, paying Ecuador $5,000,000 in gold for them and recognizing Ecuador's sovereignty over the islands. Mr. Roosevelt replied that he would recommend the proposal to Congress and was sure it would be accepted, offering to appoint the American Minister to continue the negotiations at Quito."

Señor Garcia visited this country in March, 1903. He was then Minister of Finance and Public Works. In August, 1905, he became President. It is said in Ecuador that the negotiations of which the memorandum speaks were ended by the Alvaro revolution, which resulted in Garcia's overthrow; also that the islands were first offered to France. The official papers now call Garcia a traitor for trying to sell part of the national territory. This group of thirteen small islands is situated under the equator, 730 miles west of Ecuador and 850 miles southwest of Panama.

Railway and Trust Questions

John D. Rockefeller returned from France on Saturday last, and will go to Ohio this week. He is under bond to appear at Findlay for trial on September 4th in a suit against the Standard Oil Company and himself for violation of Ohio's Anti-Trust law. The sessions of the Federal grand jury in Chicago will begin on August 6th, and the inquiry made at Cleveland will be continued there for the purpose of completing a chain of evidence upon which the Standard and certain railroad companies can be prosecuted successfully for violating the law which forbids the giving or the receiving of freight rebates.——From Nebraska comes a curious story about the destruction of railway records belonging to the Burlington road. It is asserted that on the 26th ult., two freight cars full of barrels and boxes which contained accounts, letters and other papers were taken to an obscure siding near Belfast, about eight miles from Greeley Center, and were burned there by four railway employees, who first poured kerosene oil upon the cars and the papers. Some of the papers were blown away and were picked up by a farmer named Matthew Luce. They related to the payment of rebates. One has been published. It is dated March 11th, 1904, and directs the payment of the rebate claims of John Stewart, of Concordia, Kan., saying: "Our agreement with Mr. Stewart is to refund 33⅓ per cent. on the charges on the shipments which move from points within the State of Kansas." Rebate checks and papers relating to them are said to have been found by Luce. Officers of the company say they know nothing of the incident, and that it has been their rule to destroy no records un-

til they were twenty-five years old.—— At the recent investigation concerning the roads engaged in the Eastern bituminous coal trade, the evidence indicated that the Norfolk & Western, Baltimore & Ohio and Chesapeake & Ohio were controlled by the Pennsylvania, several of whose prominent officers were directors of the other roads and members of their executive committees. Last week John B. Thayer (a vice-president of the Pennsylvania) and William H. Barnes (a Pennsylvania director) resigned from the Norfolk & Western board. Their successors, Henry C. Frick (a prominent Pennsylvania stockholder) and L. C. Weir, president of the American Express Company, will, it is said, represent the Pennsylvania's interests. Three of the Pennsylvania's vice-presidents remain in the Norfolk & Western board. Vice-presidents of the Pennsylvania are also in the Baltimore & Ohio and Chesapeake & Ohio boards. It is said that some of them will withdraw. It has been reported that the Government would prosecute these corporations (operating parallel lines) for violation of the Anti-Trust law.——The Commission will soon begin, it is announced, a long and searching investigation concerning the railways engaged in the anthracite coal trade. William A. Glasgow, Jr., will conduct the inquiry.——The decision of a Virginia court that the State's new law making the passenger rate 2 cents for mileage books is not accepted as final by the Attorney-General, who will take the question to the Supreme Court at Washington.

Various Topics It is feared that the recent exclusion at Seattle of a Chinese student will be resented in China. Dr. C. D. Teney, a Harvard graduate, who is now a member of the faculty of the Imperial Chinese University, brought to Seattle thirty-eight Chinese students, on their way to the Harvard summer school at Cambridge. One of them was excluded and deported, under the immigration laws, because he had the infectious disease of the eyes known as trachoma. His companions proceeded to Cambridge. Some of them will eventually go to schools in England, and others will study engineering in this country.——The number of immigrants received in the last fiscal year was 1,100,073, against 1,026,499 in 1905. A great majority came from Austria-Hungary, Russia or Italy. The number of applicants debarred, in most cases on account of disease, was 73,574.——Additional convictions for violation of the land laws are reported. In North Dakota, A. C. Huidekoper and E. C. Huidekoper, of Meadville, Pa., have been fined and sent to jail for one day, for illegally taking land for a ranch. In Oregon, those found guilty last week of defrauding the Government were M. C. Hoge, city attorney of Medford, and Charles Nickell, the publisher of two newspapers.——Owing to the efforts of Governor Beckham and others for an enforcement of the laws, Covington is now the only city in Kentucky, it is said, in which liquor is sold in Sunday. A similar movement led by Governor Folk in Missouri has closed the saloons on Sunday, except in outlying parts of the county which includes St. Louis. In Ohio, the new law, increasing the annual license fee from $350 to $1000, has reduced the number of saloons from 12,934 to 9,956. License revenue has, of course, been increased, and for the last six months it was at the rate of about $9,000,000 a year.

Cleveland's Street Railways Mayor Tom L. Johnson, of Cleveland, was in court last week to answer a charge of contempt, owing to his attempt to promote the construction of the new street railway, on which the fare will be 3 cents. On the 24th ult. the old company (Cleveland Electric) applied to the Council for an extension of its franchises, offering in return to sell 7 tickets for 25 cents, give universal transfers, and build new branch lines when directed to do so. On the following day 400 men under the direction of the Mayor and other city authorities began to tear up the old company's track in Fulton street. Mayor Johnson explains that on June 11th the Council, by resolution, ordered the company to remove its single track on Fulton street to the east side of the street, and at the

same time directed the Board of Public Service to do the work if it should not be done by the company within 30 days. At the end of 44 days nothing had been done. Therefore the Mayor proceeded to enforce the Council's order, and was present in person, directing the workmen. In the middle of the day the old company served upon him and W. J. Springborn, Director of Public Service, an injunction obtained from Judge Ford, of the Common Pleas Court. The Mayor coolly pocketed the papers and ordered the workmen to continue their labors. In due time the old company's track on Fulton street had been removed, and the new company was laying its rails. On the 26th the Mayor and Director Springborn were cited to appear before Judge Ford to answer a charge of contempt, in that they had ignored his injunction. They were present and arguments were heard, but decision was postponed. As a result of the contest, the price of the old company's stock sharply declined. The new company was organized in the interest of municipal ownership and 3-cent fares, and its stock was distributed by popular subscription. It operates in unoccupied streets and others where the old company's franchises have expired. —— Disappointment is expressed in Philadelphia because the suburban trolley roads, controlled by Mayor Johnson, of Cleveland, have entered into an alliance with the trolley monopoly of the city. Some expected that the Mayor would enter the city by means of a new line, compete with the present monopoly and reduce fares. Insead of taking that course, he has made a traffic agreement, by the terms of which his cars will enter the city on the city company's tracks.

Cuba and Porto Rico

The telegraph incident in the Isle of Pines is closed. On the 26th ult. President Palma granted pardons to L. C. Giltner, William Augustine and Miss Millie Brown, the three American residents who had been imprisoned at Nuevo Gerona for violating (at Columbia) the old military order forbidding any one to operate or own a telegraph line without permission from the Government. They had been placed in jail because they refused to pay the fine imposed by the court. Altho orders had been given that Miss Brown should be removed to the Mayor's residence, she was still in jail, preferring to remain there until the arrival of her father, who was in the States. Our Minister at Havana had reported to Washington that the affair was not of enough importance to warrant the sending of a full account by cable. It was recommended by the Cuban Secretary of Justice that pardons be granted if the convicts would promise never to do it again. They did so promise and were released. Miss Brown's mother, being in Havana, had said she should insist upon paying the fine, because she could not permit her daughter's imprisonment to be used by American revolutionists in the Isle of Pines to create sympathy with their cause. It appears that the telegraph was a mere toy, used by three households, partly for amusement and partly for instruction. —— Concessions due to the short stature of Porto Ricans are made in an order issued by the General Staff at Washington with reference to enlisted men in the Porto Rican provisional regiment. The minimum height of men admitted is to be 5 feet 2 inches. In the regular army the minimum is 5 feet 4 inches. Other minimum measurements are proportionally reduced.

Our Pacific Islands

In Leyte, the Pulajanes who attacked the constabulary on the 22d ult., have been severely punished. Three days later, these fanatics, about 350 in number, encountered and attacked a small force of the constabulary and one company (only 26 men) of the Twenty-fourth Infantry, a negro regiment. The fight lasted half an hour, and at the end of it 150 of the Pulajanes were dead. Only one American was wounded. It is said that the military ability of these negro soldiers has heretofore been underestimated by the Filipinos, who have spoken of them with disrespect.——Altho Congress failed, at the recent session, to give the Filipinos that tariff relief which Secretary Taft sought, it now appears that it did pass a bill which largely increased the Philippine duty on a certain kind of cheap cotton cloth which

they have used in large quantities. At the time of its passage, both in the House and in the Senate, this bill seems to have escaped attention. American manufacturers, it is said, are unable to compete with manufacturers abroad in supplying cloth of this kind, and it is asserted that the higher duty was imposed in order that the Filipinos might in this way be induced to buy American goods of a different quality.

The Pan-American Congress

The Pan-American Congress is still engaged in preliminaries and has not yet got down to business. Secretary Root and his family arrived at Rio de Janeiro on the "Charleston" last Friday, and was met by Ambassador Griscom and Señor Nabuco, the President of the Pan-American Congress. Mr. Root on landing had an audience with the President of Brazil, and ever since has been the chief figure of one continuous round of entertainments. He is recognized by the populace and cheered whenever he goes upon the streets. The Drago doctrine, which opposes the collection of private debts from nations by force, seems to be the one topic that will excite the most difference of opinion when it comes before the Congress. It is understood that Secretary Root advises that no attempt be made to dictate to creditor nations, and his counsel is likely to prevail. But if the Congress takes no action the United States will submit the whole question to the next Hague Conference. The cruiser "Buenos Ayres" has been placed at the disposal of Mr. Root by the Argentine Government to bring him from Rio de Janeiro when he wishes to proceed to Argentina, Uruguay and Chile, but Mr. Root will continue on the "Charleston," as accepting such a favor from Argentine would be likely to cause jealousy. The press of South America is commenting very favorably on Mr. Root's visit, to which they attach much importance.

The Interparliamentary Conference

The Interparliamentary Union adopted substantially as presented the resolution of William J. Bryan providing for the formation of an international commission of inquiry or mediation, according to The Hague Convention, in any case of disagreement between two Powers, before resorting to any act of hostility. The Union also favored the inclusion, contrary to the program of the Czar, of the discussion of the reduction of "the intolerable expenditure on armaments" in the next Hague conference. In regard to the rights of neutrals and the definition of contraband of war, the following resolution was adopted:

"The Interparliamentary Union, now assembled in London, expresses the view that the second Hague conference should:

"First—By treaty define contraband of war as being restricted to arms, munitions of war and explosives.

"Second—Reassert and confirm the principle that neither a ship carrying contraband of war nor other goods aboard such ship not being contraband of war may be destroyed.

"Third—Affirm that even between belligerents private property should be as immune at sea as it is on land."

Mr. Bryan's speech on the victories of peace at the luncheon given the Conference at the House of Lords was highly praised for its eloquence and good sense by the English press. Afterward, by request of the King, Mr. Bryan was given a private audience at Buckingham Palace, only King Edward, Ambassador Reid and Mr. Bryan being present.

The British House of Commons

The new Education bill providing for the nationalization of the public schools and the suppression of Government appropriations for denominational teaching in them, which was introduced by Mr. Augustine Birrell, President of the Board of Education, on April 9th, was passed by the House of Commons on its third reading by a majority of 192. In spite of the strong opposition made to it, both inside the House and in public, no material alteration was made in it, altho a number of minor amendments were accepted. The bill now goes to the House of Lords, where the fight against it will be renewed.——Mr. Keir Hardie, the Labor leader, questioned the Government about the alleged atrocities committed by the troops in the suppression of the Natal rising, in which, as reported by the newspapers and private letters, no quarter was

given to the wounded Zulus. Mr. Winston Churchill, in reply, said that the Governor of the Colony reported that the number of natives killed was about 3,500 and of wounded and prisoners 2,000. It was possible that some of the native irregulars, out of sight of their officers, might have killed the wounded. A question from Mr. Redmond asking whether it was true that the head of Bambaata, the Zulu chief, was cut off and exhibited in triumph, gave Mr. Churchill an opportunity to give another hit at Lord Kitchener, whose conduct in the Sudan campaign he had criticised in his first book. He said that Bambaata's head had been cut off for identification by the natives, but that it was not wise to discuss the subject, because nothing was done half so disgraceful to civilization as the treatment of the Mahdi's body after the capture of Omdurman.

The Russian Crisis

It is difficult to tell much about the real situation in Russia because, owing to the rigid censorship of the press and the policy of repression adopted by the Government, the revolutionary movements, if there are such, are carefully concealed. It is obvious, however, that no outbreak of violence against the Government, such as was generally expected on the dissolution of the Duma, has taken place. On the contrary, the country as a whole has been freer from riots, strikes and assassinations than when the Duma was in session. Whether this indicates a general acquiescence on the part of the people with the action of the Government in dismissing the Duma, or whether it is merely the lull before the storm of revolution breaks forth cannot be said. Evidently the revolutionists, whatever may be their plans, do not consider the time favorable for open revolt. The peasants are busy and cannot be persuaded to attack the country-seats and the towns until after the harvest. The employees of factories and railroads do not seem inclined to engage in a general strike. A few months ago they were striking on the slightest provocation, with or without orders from their leaders. Either they are tired of their former experiences or they are being restrained. But arms are being secretly imported and plans made for a revolutionary rising in the fall, if not before. At Poltava a battalion mutinied because one of their number had been arrested for attending a revolutionary meeting. They marched to the prison, but the rest of the garrison called out to suppress the outbreak attacked them as they were breaking down the gates of the prison and fired upon them with machine guns. At Helsingfors, Finland, a very serious mutiny has broken out, and, according to the latest reports, the fortress of Sveaborg, which guards the harbor of the capital, is in the hands of the mutineers and is being bombarded by the gunboats. Several hundred officers and men are said to have been killed or wounded. The outbreak resulted from the death of a sapper from ill treatment. Premier Stolypin has not yet succeeded in forming a cabinet, as even the most conservative members of the former Duma refuse to ally themselves with the Government at this crisis. M. Stolypin promises thoro reforms in administration and measures for the benefit of the peasantry, but at the same time he is using all the forces of the bureaucracy to repress revolutionary agitation. All the radical newspapers have been suppressed. All the clubs in St. Petersburg except the gambling clubs have been closed. Telegraphic despatches sent out of the country are rigidly censured, and foreign newspapers are confiscated or have columns blacked out in the old way. Members of the Duma are being closely watched, but only a few of them have so far been arrested. The Public Prosecutor has begun proceedings against the 213 members of the Duma who signed the Viborg manifesto advocating passive resistance, on the charge of treason. This is probably done for the purpose of making them ineligible for re-election, rather than with a view of punishing them.

The Appeal to the Army

The Group of Toil, composed of the most radical members of the dissolved Duma, is co-operating with the Socialist Revolutionary party in an effort to rouse the peasants and workingmen to revolt and to undermine the loyalty of the army and navy to the Government. They regard the Viborg manifesto, drawn up by

the Constitutional Democrats and advocating mere passive resistance as weak and futile, and have supplemented it by two manifestoes of their own, one addressed to the peasants, enticing them to seize the land of the State and the nobility, as it is theirs by right, and the other to the soldiers and sailors, appealing to them not to fire upon the people. The following quotations from the latter will show the tenor of their arguments:

"Soldiers and Sailors—The Government has by imperial command dissolved Parliament, and troops have been assembled from all sides to oppress the people by armed force. The people's representatives were elected from among your fathers and brothers in order to lay before the Emperor the needs of the people and to obtain land and liberty. But the Emperor would not listen to the elected of the people.

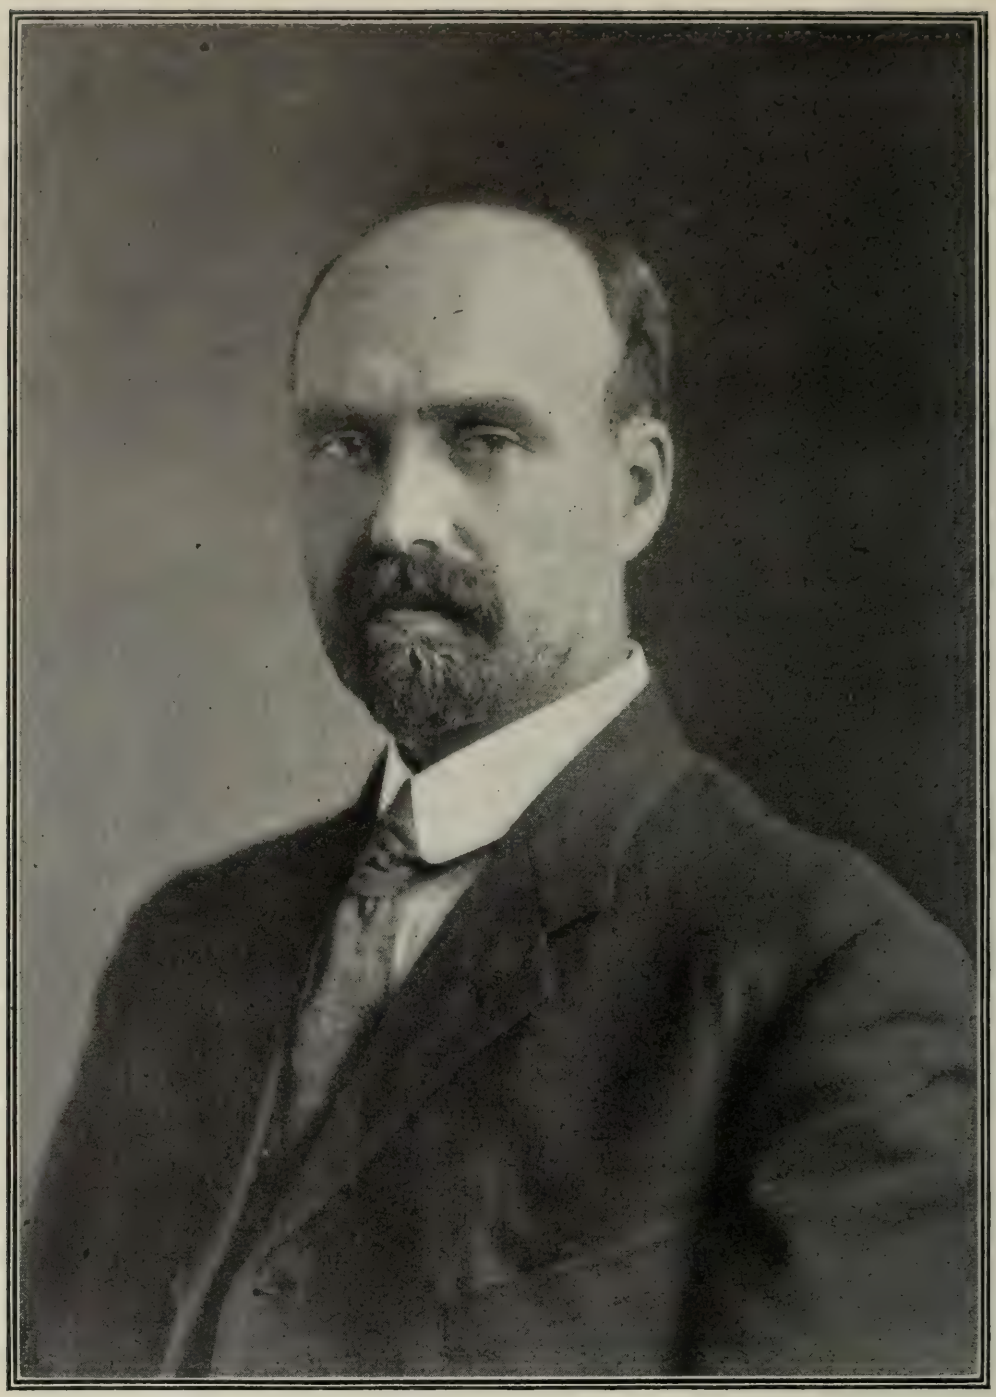
"Will you shoot the people, shed the blood of the people, and transfix the people's breasts with bayonets? Remember that you are the children of peasants, that you are the children of the Russian people, and that in the villages where you were born your own brothers who are remaining home are also agitating, are also demanding land and liberty, and that the Government is sending other troops to shoot and beat them. Why will you defend the Government? Do you, yourselves, live so well? Are not you, yourselves, in a state of servitude? You are in a worse state of bondage than all the others. You are made to act as officers' servants, you are tormented in discipline battalions; for every free word you are sent to hard labor or shot.

"We, the representatives of the people, wished to promulgate laws providing for a reduction of the term of military service to two years, for the abolition of soldiers' employment as servants, for the payment of a monthly wage to soldiers, and for the effective prevention of all insults to the rank and file by those placed over them. We wished to improve the lot of the soldiers, but the great aim before us was to improve the lot of the whole working population. To prevent all this the Government hastened to dissolve Parliament.

"Soldiers and Sailors—We, the legally elected representatives of the peasants and workingmen, declare to you that without Parliament the Government is illegal. Orders which it may now issue have no legal force. We call on you:

"Firstly—To cease to obey the illegal Government and actively to oppose it in conjunction with us and the whole of the poor population. You have taken an oath to defend the Fatherland. Stand beside us for land and liberty.

"Secondly—Any man who shoots at the people is a criminal, a traitor, and the enemy of the people. We inform all such, in the name of their fathers and brothers, that they will not be allowed to return to their homes, and that over their names will hang the eternal curse of the people.



"Thirdly—The Government entered into negotiations with the Austrian and German Emperors, and German troops are ready to invade our country to defend the Government, which opposes the people, with the power of foreign arms.

"By such negotiations, we declare, the Government has betrayed the country and is now outside the limits of the law.

"Soldiers and Sailors—Your sacred duty is to free the Russian people from the treacherous Government and defend Parliament. Every man falling in this holy war will cover himself with eternal fame, and the Russian people will bless his name. In this struggle your elected representatives will be with you. Be brave for the Fatherland, for the people, and for land and liberty against the criminal Government."

Foreign Notes

A rifle bullet fired from the French cruiser "Dupetit Thouars" while engaged in target practice in the harbor of Che-Foo, China, struck and killed Lieutenant Clarence England on the American cruiser "Chattanooga." The French Government has officially expressed its regrets for the accident.——Major Alfred Dreyfus was decorated with the cross of the Legion of Honor in the presence of the troops on the same spot where, twelve years before, he was publicly degraded for treason by having the insignia of rank cut from his uniform and his sword broken. After the ceremony and the review of the troops, Major Dreyfus received the congratulations of his brother officers and of the friends who had worked for him, among them Brigadier-General Picquart, Anatole France and Alfred Capus. Madame Dreyfus and his son were also present.——The Council of the Legion of Honor has refused to award a cross to Madame Sara Bernhardt, who was recommended by the Government for that honor.——The troops of the Sultan of Morocco attacked the camp of the Pretender near Mulaya and completely routed the rebels with heavy loss after a fight lasting all day. The leader of the Pretender's forces, Kaid Azus, escaped to Zeluan.——Viscount Kodama, who was the strategic leader of the Japanese campaign against Russia in Manchuria, died on July 22, and his place as Chief of the General Staff is taken by Baron Oku, who commanded the third Japanese army and drove Kuropatkin out of the Liaotung peninsula and back to Tie Pass.

Dr. Elmer E. Brown, appointed Commissioner of Education by President Roosevelt upon the resignation of Dr. William T. Harris, belongs to the group of younger men among the educational leaders of the country. Identified by birth with the Empire State, he is in a larger sense representative of the Middle West and the Pacific Coast. The University of Michigan is his Alma Mater and the field of his earliest work as a university professor. His studies were completed in the philosophical faculty of Halle, where he gained his Ph.D. and strengthened his natural bias for historical research. Combining with high scholarship the practical experience of a teacher and superintendent of public schools, he brought to the Professorship of Education in the University of California, which position he has held since 1893, a combination of qualities that found full scope for exercise in the peculiar administrative relations of that university to the school system of the State. Under his guidance the influence of the University Chair of Education has been felt thruout the State. At the same time he lifted the department itself to the level of the older faculties. Dr. Brown's intimate knowledge and discriminating estimate of the typical institutions of this country are illustrated in his monograph on "The Origin of American State Universities," and more strikingly still in his book, "The Making of Our Middle Schools," which for scholarly method, scope of research and comprehensive grasp of the many social factors that enter into the life of institutions will long rank as an educational classic. Appointed President of the National Council of the National Educational Association in 1904, Dr. Brown has shown in the conduct of its affairs during a critical period of its history, as in his university relations, the energy, steady purpose and regard for high ideals which promise a vigorous administration of the National Bureau of Education.

AT NAPLES

BY ALFRED AUSTIN

POET-LAUREATE OF ENGLAND.

'Tis night, and floateth from afar
The sound of careless, wandering feet,
And, coaxed from mandolin and guitar,
Music voluptuously sweet.

Whereto the languid wavelets keep
Time round the deeply curving bay,
From where the magic Mantuan sleeps,
To native nest of Tasso's lay.*

But what is it haunts the midnight air?
Is it the unseen wailing ghosts
Of God and Goddess fled elsewhere,
Who one time ruled these radiant coasts?

Yes! vain, Pandean pipe, and lute!
Only in corridors and halls,
Divinities, in marble mute,
Stare from their chaste cold pedestals.

"Have they then gone, to come no more?"
The sighing sea-waves seem to say,
And, wandering lone from shore to shore,
Yearn for a Something passed away.

NAPLES, ITALY.

* Mantua me genuit; Calabri rapuere, tenet nunc
Parthenope; cecini pascua, rura, duces.—*Virgil's Epitaph.*
Tasso was born at Sorrento.

The Chautauqua Movement

BY JULIA C. UNDERWOOD

THERE is no more significant movement in the educational world of today than the astonishing growth of Chautauquas all over the country, and especially in the great Middle West.

And there are so many of these assemblies. It is almost easier in the Mississippi Valley to name the towns of a few thousand inhabitants which cannot boast a Chautauqua than to mention the others so proud of their dignity. Very often these gatherings are but for a week or ten days, after the fashion of the receding county fair, but they are very earnest and very live while they do last. A few, perhaps, justify the taunt of "Sunday-school vaudeville," which is sometimes heard, and possibly some are organized for ulterior purposes. But the general conclusion may be fairly drawn that, altho gate-receipt greed and ambitious desires of real-estate men occasionally

The Tent at the Trenton (Mo.) Chautauqua, with Seats for 4,000.

A Nature Study Class at Winona Assembly, Winona, Ind.

cast a slur on the name, the average Chautauqua, large or small, is giving a help which nothing else can give to every one that attends it in good faith.

It would seem to be the time of the renaissance of the stump speaker, and not for mere partisan purposes. For plain instruction the people are harking back to the "living voice." The newspapers, which once printed in full the great speeches of the nation, are abbreviating these to almost nothing, in order to make room for all other abbreviated things ever heard of in the world, and there is no longer the solid benefit of sitting down by the hour, to pore over the utterances of the leaders of public opinion, except, of course, for the few persons in communities of leisure who do still read the *Congressional Record* as it is published day by day. To the bulk of the people truth means more when it comes thru a personality, and so now, as before the days of the daily newspaper, they are listening gladly to the spoken word.

In planning Chautauqua assembly lectures the good government speeches are commonly arranged first, and the other addresses revolve around these. One distinguished Senator or one reform Governor is not enough. Hardly any Chautauqua of this summer has had less than three such speakers, and "Civic Week," generally near the beginning of each assembly, has figured more largely in drawing crowds than any other one single attraction.

Governor Folk, of Missouri; Governor Hoch, of Kansas; Governor Mickey, of Nebraska; Senator La Follette, of Wisconsin; Governor Hanly, of Indiana; Governor "Bob" Taylor, of Tennessee (with his fiddle as a relief from too much statecraft talk); Congressman William R. Hearst; Congressman William Sulzer; Judge Benjamin Lindsey, of Denver, the juvenile court authority; and Attorney-General Hadley, of Missouri, are among the "stars."

It is a coincidence worth noting that the Chautauqua Assembly movement began—under Bishop Vincent, of course, of the Methodist Episcopal Church, at Chautauqua, N. Y.—almost in the same year that the Methodist Episcopal laity

were granted representation in the general conference. The two ideas have gone forward with equal step, and there is a connection in all the churches and denominations between the summer Bible conference and the new activity of the laymen. The laity more and more evince an unwillingness to sit back and merely listen to the ordained ones. The layman is practical, and wants help, not rhetoric. With the young people the religious convention, where there are set speeches by "their betters," is not nearly so much in favor as the assembly, where the members meet in classes and as practical students assimilate the good things that their leader may have to give, supplemented by mutual comparison of methods and experiences.

A Clearing in the Grounds of the Congregational Summer Assembly at Frankfort, Mich.

Four years ago the grounds of the Congregational Summer Assembly, at Frankfort, Mich., between Lake Michigan and Lake Crystal, were platted. Congregational laymen have not yet, unfortunately, got as much into the way of enjoying this fly-less, mosquito-less paradise among the pines as have the ministers and their families, but the suggestion and inspiration which have come out of the Assembly, especially in the way of modern Bible study, under such eminent leaders as President King and Professor Bosworth, of Oberlin; Professor Lloyd, of Evanston, and the late Professor Stevens, of Yale, premise a spreading of the benefits to a much larger number.

The Winona Assembly, which, with its consolidation of many schools and its scheduled attendance of 250,000 last year, has again and again remarked of itself that it is "not a place, but a movement," is securely established with the co-operation of the Presbyterian Church. Here in several different years the General Assembly has met, and here the Bible conference is in charge of the General Assembly's evangelist, Dr. J. Wilbur Chapman. But no Chautauqua Assembly can be bounded by one denomination, not does it desire to be.

There is some bit of myth or popular faith, some rarely gracious invitation of Nature, to characterize every one of the summer assemblies. The Chautauquan who has gone again and again to the Colorado Assembly will take you rever-

ently to the valley where grows the one perfect tree in the world, he says. It is what a tree ought to be, but what no other tree ever was. For each branch on one side grows a branch on the other side. It is perfectly balanced, splendidly faultless. At the Congregational Summer Assembly healing waters flow—a sulphur spring spoken of ages ago by early *voyageurs* whose health revived thru its beneficence. At the Piasa Chautauqua, the "Piasa Bird," engraved ineffaceably high on the eastern cliffs of the Mississippi River, is told about in whispers as a terrible flying demon which once lived and preyed upon men until in mercy the Great Spirit permitted a noble chief to impale it with his arrow.

In the Ottawa Assembly, where, in the Ottawa (Kan.) Forest Park, of 70 acres, only in large cities, brought original works of Gibson, Remington, Parrish, Smith, Leyendecker, Keller, Stephens and Christy to their unjaded eyes. In the same Chautauqua the oratorio "The Messiah," sung on the closing night by a chorus of 150, with the aid of soloists and an orchestra, had an audience of 5,000.

A Chautauqua without much music is indeed an anomaly. Where the birds sing as they please in the places of public assembly, it is impossible for human beings not to try to make melody also. The Gargiulo Italian Band, the Thomas Orchestra, the Kilties' Band, the Bell Ringers, with many other such entertainers, and locally organized choruses and orchestras, give pleasure to the goodly company.

The Tree Spring in Winona Park, Winona, Ind.

on the Marias des Cygnes River, this earliest of all the Western Chautauquas has been meeting for twenty-seven years, the veteran students of nature demand the best of art also, and the Collier $300,000 collection of pictures, exhibited hitherto

The uplift of the literature departments of the Chautauquas is immeasurable. Intellectual leaders who would be entirely unavailable at any other time of the year are not averse to coming to woods or mountain with lectures which they do not

have to prepare anew, and their words are received as manna by the schoolma'ams and other routine-wearied workers who, in the winter, can never hope to "go anywhere." Popular science and physical culture, studies in pedagogy and music, even dressmaking and needlework, and always elocution, enlist live classes the country over.

The dozens of single lecturers, selected most carefully by the Chautauqua boards to talk on travel, and temperance, and history, and art, and country life, on emigration, and industrial conditions, and popular reforms, on the public schools, and the advancement of the negro, on every subject which seems to appeal to the American people, have candid audiences at the assemblies. If an evening's rowing invites more strongly than the subject announced and the man who is to treat it, off they go and the speaker is left with but a few hearers. But if, on the other hand, the "call of the wild" is powerless to take the people away, and they fill the seats and throng the edges of the tent, and listen outside from seats on the sod, he may be assured that he has a message.

Chautauqua social usages are gracious and worth remembering. The small ceremonies, adorned with such simple yet serious forms, are like those of an honored small college, in which commencement day becomes a personal celebration to every one living in the town. The arch of green at many Chautauquas, under which the C. L. S. C. graduates receive their diplomas, is a bit of symbolism very significant to those participating. At the Colorado Chautauqua all the members are linked in loyalty to a hostess, Miss Winn, who gives numerous receptions, a "gathering of the States," a "Texas Day," because Texas has much to do with the assembly, and finally an "annual banquet," to close the season.

It is everywhere a part of the Chautauqua spirit to broaden the heart as well as the mind.

ST. LOUIS, MO.

The Seer of Santa Rosa

BY NELLIE EVANS

A SIMPLE home-spun gentleman,
  Who needs no coat-of-arms
Or patent of nobility
  Won in war's brute alarms.

Strong-hewn from Nature's granite he,
  Heir of her larger lore,
Eager to turn some hidden page
  And con it o'er and o'er:

Till in a crucial hour he finds
  The secret of the tree,
The necromance of bud and flower,
  The witchery of the bee;—

Father-confessor he of birds,—
  Blood-brother in the clan
Of grey night-moths and butterflies,—
  Friend of the shy god Pan.

Nor has the blight of worldliness
  Within that heart found room,
Unconscious of his greatness,
  As a rose is of her bloom.

ENGLEWOOD, N. J.

THE EDUCATIONAL BOOKS OF THE YEAR

For the benefit of the large number of teachers who are readers of THE INDEPENDENT we publish every year at this time a list of one or two hundred books for use in schools and of interest to teachers. The number of educational books issued is so great that they cannot be reviewed in detail, but we have endeavored to include all the important new books. The books in each class have been submitted for brief appraisement and criticism to a successful teacher in that subject. From these comments teachers can see what books of interest have appeared during the year, and buy them for further examination, provided, of course, that they are not victims to the bad habit of trying to "work" the publishers for a "sample" copy. We have given special reviews to many educational books of a less technical character in our regular literary department, and their names do not appear here.

English

A Brief English Grammar. By Fred Newton Scott and Gertrude Buck. Chicago: Scott, Foresman & Co. 60 cents.

English Grammar for Beginners. By James P. Kinard. New York: The Macmillan Co. 50 cents.

Rhetoric in Practice. By Alfonso G. Newcomer and Samuel S. Seward, Jr. New York: Henry Holt & Co. 90 cents.

A Course in Narrative Writing. By Gertrude Buck and Elizabeth W. Moeris. New York: Henry Holt & Co.

A Desk-Book of Errors in English. By Frank H. Vizetelly. New York: Funk & Wagnalls. 75 cents.

Essays in the Making. By Eustace Miles. New York: E. P. Dutton & Co. $1.00.

The Making of an Orator. By John O'C. Power. New York: G. P. Putnam's Sons. $1.35.

Representative Essays on the Theory of Style. By William T. Brewster. New York: The Macmillan Co. $1.25.

English Literature. By Alfonso G. Newcomer. Chicago: Scott, Foresman & Co. $1.25.

The Study of a Novel. By Selden L. Whitcomb. Boston: D. C. Heath & Co. $1.25.

Literature: Its Principles and Problems. By Theodore W. Hunt. New York: Funk & Wagnalls. $1.20.

The History of the English Language. By O. F. Emerson. New York: The Macmillan Co. 80 cents.

Shakespeare's Henry the Fifth. By E. E. Hale, Jr. Boston: Houghton, Mifflin & Co. 15 cents; linen, 25 cents.

English Readings. Specimens of Discourse. By A. L. Andrews. The Lincoln and Douglas Debates. By A. L. Benton. New York: Henry Holt & Co. 60 cents each.

Pocket Classics. Essays of Bacon. By G. H. Clarke. Longfellow's Tales of a Wayside Inn. By J. H. Castleman. Washington's Farewell Address and Webster's Bunker Hill Oration. By W. T. Peck. New York: The Macmillan Co. 25 cents each.

Model English Prose. By G. R. Carpenter. New York: The Macmillan Co. 90 cents.

Thackeray's Henry Esmond. By H. B. Moore. Boston: Ginn & Co. 60 cents.

In the matter of English there seems to be something of a revival this year as compared with last. In particular the books dealing with literature have improved perceptibly in quantity and quality, showing a growing appreciation of the real needs of the subject. The number of grammars, too, has increased noticeably, with a decided tendency to remove that study from the formalism of the classical models and tradition and to simplify it in conformity with the actual structure or structurelessness of the language. One of the best books of the sort, perhaps, is Scott and Buck's *Brief English Grammar,* which is simple and familiar without being silly. Unfortunately, like most of these new efforts it is content to make some sacrifice of system to popularity and by a kind of so-called inductive treatment, such as putting the sentence before the word, to lose the discipline of a severe logical method, which is one of the greatest benefits to be derived from linguistic training. In this respect Kinard's *Grammar for Beginners* has something of an advantage, working up from the several parts of speech to the sentence as a whole, altho not quite so successful in getting rid of what is now considered, in this connection, a vain methodology. For while the one set of teachers is apparently straining every nerve to extract from grammar and rhetoric what remnants of backbone they still possess; another set

seems equally bent on reducing the study of literature to a mere rigid anatomy of definitions, formulæ, and equations.

Fully as numerous as ever are the rhetorics and compositions, and as strongly marked as ever by the bewilderment and haphazard which has come to invest this subject of late years. Indeed, if our education were to be judged, and to some extent it is so, by this sort of text book, it would not be unfair to say that it knows neither what it wants nor how to come at it. The main question after all is whether a general education should undertake to make writers of all students indifferently. Until that matter is settled on acceptable grounds—and there is much to be said for the negative—all work of this kind is bound to be unsatisfactory. In the meanwhile there is no great danger of any positive result from the general run of text-books. Provisionally, however, Newcomer and Seward's *Rhetoric in Practice* promises well to such as want, for more elementary use, something on the same general lines that have made Newcomer's *Elements* successful in the classroom. A very convenient feature of the book is the reference table at the back, which might well be imitated by all rhetorical manuals. Although the manufacture of stories by college students seems to us one of the many unfortunate consequences of the "laboratory" theory, yet the little volume entitled *Narrative Writing* contains some interesting comment on the construction of the novel and might be useful in connection with the study of literature. Tho not precisely a school book, *Errors in English* will be found a very handy auxiliary for any employer of the language. It contains an alphabetical list of the most remarkable words in ordinary employ, with a brief discussion of the usage, meaning, abuse, and so on of each. As an outside reference *Essays in the Making* may also be recommended to the individual student of authorship, tho too professional for a text-book. Another volume valuable in something the same way for personal study is the *Making of an Orator*. It contains a number of excellent hints and suggestions to the public speaker of any sort, conceived and presented in a simple and unpretentious fashion, as well as analyses of several of the greatest examples of oratory.

Among the many histories of English literature in existence it is hard enough to choose already. To augment the number then, without manifest improvement would seem a small service to education. It is, therefore, rather a matter of gratitude that this year's crop is not particularly luxuriant. One of the best, tho no better than some others in present use, is Professor Newcomer's. Quite properly, in a work of this nature, it is animated by a desire to make literature count above history and biography, and contains a rather unusual amount of appreciation, some of it rather good, altho like most English literature it fails to elicit clearly the developmental ideas or increments of the successive periods. In this connection may be mentioned Whitcomb's *Study of a Novel,* an attempt toward a thoro description and classification of the various phenomena of prose fiction as a literary *genre.* As an attempt to break ground in a comparatively uncultivated field the book is commendable. The writer has got together a good deal of material where it can be found when wanted. But he is by no means so happily inspired in throwing the weight of his influence in favor of a technology, with its obvious definitions, strained terminology, and tumefied formularies, rather than a clear and flexible criticism. This is no place to dispute over "scientific" criticism—tho Professor Whitcomb is rather too much under its malign influence—but when will our scholars learn that much baggage is only a hindrance in their literary excursions? Whether Professor Hunt's *Literature* belongs to any of our present categories or not, it is at all events an unusually able, thoro, and discriminating treatment of literary questions and might be read by all serious students and teachers with great advantage to the clarity of their ideas. It undertakes to discuss all the important problems suggested by its title and as far as possible to pass judicially upon the various opinions that are held with regard to them. In this respect it is particularly admirable, and manages, without being in any sense old fogy, to pick

its way safely, thru the mazes of its subject, untroubled by modish fogs and confusions. It insists, for instance, on the distinction between literature and linguistics, on the literary inadequacy of "a purely artistic effect" without an ethical element, on the need of sound literary canons, and on the desirability of generalization in literary study, so closing the door upon the pernicious idea that literary sense can be cultivated on the basis of a single text or author.

Of reading texts there is no lack; but happily the inclination to duplicate what is already good enough seems to be yielding to a commendable desire to multiply the number of handy classics. There is still an absence, however, of good critical introductions of a sort that will do something for the student's appreciation of letters, and an inveteracy in neglecting the thought of the author for irrelevant curiosities of one kind and another. If a taste for literature is to be cultivated at all, it is necessary to relate it in some manner with life, and particularly with the moral experience of humanity, and to relegate verbal and philological commentary to a very inferior place. As texts, most of the titles quoted in the general list explain themselves. Professor Hale's *Henry the Fifth*, however, may be noted for its pertinent, if rather slight, analysis of "rhetorical poetry," which is of real assistance in the just estimate of the Shakespearean drama; while attention may be called to two additions to Heath's generally excellent *English Readings*, namely, fairly well-selected "specimens" of the forms of discourse, preceded by some pages of rhetorical discussion; and a convenient issue of the Lincoln-Douglas debates in a careful historical setting by Professor Bouton.

The Dalles of the Columbia River. From Morris's "Heroes of Discovery in America." Lippincott.

Greek and Latin

Lysias: Selected Speeches. Edited by Charles Darwin Adams. New York: American Book Company. $1.50.

The Euthyphro, Apology and Crito of Plato. Edited by F. M. Stawell. New York: G. P. Putnam's Sons.

Greek Prose Composition. By Clarence W. Gleason. New York: American Book Company. 80 cents.

Caesar's Gallic and Civil Wars. Edited by Maurice W Mather. New York: American Book Company. $1.25.

Selections from Ovid. Edited by G. J. Lang. New York: D. Appleton & Co. $1.40.

Elementary Latin Writing. By Clara B. Jordan. New York: American Book Company. $1.00.

An edition of the speeches of *Lysias* for college freshmen is somewhat of a novelty; and yet there is no good reason

why this should be so. He was the first to apply successfully rhetorical theory to practical speech, and his simplicity and directness are more in tune with present day oratorical methods than the brilliant and impassioned style of Demosthenes. Dr. Adams is evidently familiar with the exhaustive work of the great German scholars on *Lysias,* and has made judicious use of the stores of material accumulated by them. His edition is really a credit to American scholarship. The general introduction, in which the life, works and style of the orator are discussed, is impeccable, and the same may be said of the particular introductions to the several oratories. The notes, copious, but not excessive, are marked by sobriety, clearness and precision. Students are familiar enough with the *Apologia and Crito* of Plato, but the *Euthyphro* has hitherto been the least read of the dialogs; and yet there is none of them in which the remorseless irony, the humiliating and relentless questioning and the bewildering character of the method of Socrates generally are brought out more finely. Mr. Stawell's edition is excellent in many respects, but he might have been a little more generous with his notes, especially to the *Euthyphro.* We owe to English philologists the best editions of the dialogs, and in the present edition the text is flawless, a thing of beauty. Professor Gleason's *Greek Composition* is a simple and well-graded course of exercises based on the first eight chapters of the Anabasis. The book has a complete system of cross references and a vocabulary. It has been usual until recently to limit the study of *Cæsar* to the first four books of the Gallic War, altho the succeeding books and the Civil War really contain the most interesting portion of his writings. Professor Mather has, in the present work, made a selection of the most important episodes from both narratives, and has done so with taste and judgment. The edition is well mapped, magnificently illustrated, and supplied with a vocabulary and an abundance of notes. Indeed, if there be any fault, it is that things are made too easy for the student. If he were compelled, as he ought to be, to learn his rules of Latin prosody by heart and apply them, there would be no need to mark for his benefit the quantity of every vowel in the text: *modus in rebus.* Professor Lang's *Ovid* might also be reproached for requiring too little labor and knowledge from the pupil; however, this is a complaint which few pupils will be found to echo. It is, for all that, an admirable classic edition, and the form and typography make it a pleasure to the eye. The introduction gives a rapid but vivid account of the poet's life, a description of the Augustan age, and a brief outline of Greek mythology. The illustrations are all taken from modern artists, and form a pleasant change from the ordinary hackneyed pictures after ancient statues and frescoes. Jordan's *Elementary Latin Writing* differs from other existing methods, and, in some respects, seems to summarize and condense them. It is excellently adapted to give a fairly industrious pupil appreciation and mastery of the language. A novel and very interesting, as well as useful, feature is the selection of Latin quotations in the last chapter, with equivalents from English and American authors.

French

A French Reader. By A. Rambeau. 50 cents. Daudet's Robert Helmont. Edited by W. O. Farnsworth. Erckmann-Chatrian's Waterloo. Edited by Victor F. François. Bazin's Les Oberlé. Edited by C. W. Cabeen. Pailleron's L'Etincelle. Edited by O. C. Guerlac. New York: Henry Holt & Co. 40 cents each.

Labiche et Martin's La Poudre aux Yeux. Edited by Victor E. François. 30 cents. La Fille de Thuiskon. Edited by Kate Thecla Conley. 65 cents. Verne's Les Enfants du Capitaine Grant. Edited by Edith Healy. 30 cents. Dumas' Excursions sur les Bords du Rhin. Edited by Theodore Henckels. 40 cents. Hugo's Hernani. Edited by James D. Bruner. 70 cents. New York: American Book Co.

Heath's Modern Language Series. Labiche's La Grammaire. Edited by Moritz Levi. 25 cents. Moinaux's Les Deux Sourds. Edited by I. H. B. Spiers. 25 cents. Taine's L'Ancien Régime. Edited by W. F. Giese. 65 cents. La Bruyère's Les Caractéres. Edited by F. M. Warren. 50 cents. Méthode Hénin. By B. L. Hénin. 50 cents. First Year's French. By J. E. Mansion. 50 cents. Boston: D. C. Heath & Co.

Les Classiques Francais. Sainte-Beuve's Profils Anglais. Edited by André Turquet. George Sand's La Mare au Diable. Edited by Louis Corniquet. New York: G. P. Putnam's Sons. $1.00 each.

This year's crop of French texts is heavy as usual. Of grammars there are only two, neither alarmingly serious. One, Mansion's, has a difficult method of pronunciation. Neither is intended for high school. Among readers *La Fille de Thuiskon* belongs to the private-academy class, but is rather well edited. *Ram-*

beau's Reader is not sufficiently complete for high school use, and the selections jump from short, easy stories to Thiers and Sarcey. Popular writers contribute freely to the texts. Among the more elementary books are an exciting, semi-scientific story of Verne, in his easy style, and a description by Dumas of the legends of Rhine castles. Daudet's is a diary of incidents and impressions of the Franco-Prussian War. *Waterloo,* by the two men to whose writings may be attributed the shattering of the Napoleonic legend, is a sequel to *Le Conscrit.* Of a higher grade is the masterpiece of Bazin, a recent Academician, whose fame has been growing as one of the simple, naturalistic school. Three little one-act comedies deserves attention—Moinaux's *Les Deux Sourds, L'Etincelle,* by the witty Academician Pailleron, and Labiche's *La Grammaire.* There is also another edition of the latter's *La Poudre aux Yeux.* These plays are valuable in class use for their lively and natural conversation and spice the study of grammatical forms with their humor. Of "heavy" texts, Hugo's *Hernani* may be mentioned, and a valuable addition in the shape of Taine's *L'Ancien Régime,* the first volume of his famous *Les Origines.* A clear-sighted estimate of this striking and brilliant picture of France of the Revolution is to be found in the introduction. Maxims are interesting only in small doses, but a volume even of La Bruyère's maxims, valuable as a study of the manners and thought of the French of his time, will not arouse the enthusiasm of college students, chiefly because of their lack of connection and continued straining for effect.

In conclusion must be mentioned two more of the beautiful, limp leather volumes, of *Les Classiques Français,* which have often been praised—Saint Beuve's *Profils Anglais* and George Sand's *La Mare au Diable.* They are altogether in French, and intended for private readers rather than for class use.

German

Storm's Im Sonnenschein. Edited by G. L. Swiggett. New York: American Book Co. 78 cents.

Heath's Modern Language Series. Seidel's Aus goldenen Tagen. Edited by Dr. Wilhelm Bernhardt. Lohmeyer's Geissbub von Engelberg. Edited by Dr. Wilhelm Bernhardt. Grillparzer's Der Arme Spielmann. Edited by William Guild Howard. Boston: D. C. Heath & Co. 35 cents each.

Saar's Die Steinklopfer. Edited by Charles Hart Handschin and Edwin Carl Roedder. Sudermann's Teja. Edited by Herbert C. Sanborn. Heyse's Die Blinden. Edited by W. H. Carruth and E. F. Engel. Wildenbruch's Das Edle Blut. Edited by A. K. Hardy. New York: Henry Holt & Co. 35 cents each.

Schiller's Wilhelm Tell. Edited by Edwin Carl Roedder. New York: American Book Co. 70 cents.

Schiller's Poems. Edited by John Scholte Nollen. 80 cents. Goethe's Iphigenie Auf Tauris. Edited by Max Winkler. Hebbel's Herodes und Mariamme. Edited by Edward Stockton Meyer. 60 cents. New York: Henry Holt & Co.

Deutsche Reden. By Rudolf Tombo. Boston: D. C. Heath & Co. 90 cents.

Introduction to Scientific German. By Frederick William Meisnest. New York: Henry Holt & Co. 80 cents.

No grammars or *Methoden* this year, just a few texts, well chosen, with an eye to literary quality and intelligently edited. For introductory reading some of the best work of the *Jugend-Schriftsteller*—two sweetly simple stories of Storm, a lively tale of travel and adventure in a setting of nature description by Lohmeyer, editor of *Deutsche Jugend, Aus Goldenen Tagen,* by the bard of middle-class simplicity, and *Die Blinden,* a pathetic story of two blind children, told with the charm and grace of the inexhaustible Heyse. Somewhat more difficult and suitable for second year classes are *Das Edle Blut,* peculiar in its diction and choice of character, and Saar's strong story of the unfortunate stonebreakers, probably the best work of the creator of the Austrian *Novelle.* The latter will appeal to students as much for the interest of the story as for the beauty of the diction. Students of the third and fourth years, whose intensive grasp is greater, will find pleasure in Grillparzer's *Der Arme Spielmann,* the theme of which—a favorite one of his—is the antagonism of the artist nature toward the needs of practical life. The new additions of Schiller's *Wilhelm Tell* and *Poems* are praiseworthy, and also a new edition of Goethe's Greek classic, *Iphigenie,* for the completeness of its literary analysis. Originality in texts is always refreshing, and especially when the modern dramatists of the "New Spirit" are chosen. In this case it is Sudermann, and the play *Teja* is a remarkable one-act drama belonging to the famous historical trilogy *Morituri.* The characterization of the "Last of the Goths" is full of strength and softness, and the love scene is peculiarly charming. For the highest classes there is Hebbel's *Herodes and Mariamme,* which is marked by that extreme depth and

symbolism of thought so strong a characteristic of the German poetic mind; also a collection of the speeches of the greatest German statesmen, so arranged as to portray the struggle for German liberty from 1848 to 1870, and the political and economic developments thereafter. The speeches are by Bebel, Bismarck, Eugen Richter, Von Bülow, Carl Schurz, etc. In the notes are economic and political facts illustrating and emphasizing the different points. The *Introduction to Scientific German* consists of eight lectures on air, water, light and heat, which were delivered before a German scientific society.

Japanese Field Guns in Action at the Battle of Liao-Yang. From Harding's "Essentials in Medieval and Modern History." American Book Co.

Civics

City Government for Young People. By Charles Dwight Willard. New York: The Macmillan Co. 50 cents.
Lessons for Junior Citizens. By Mabel Hill and Albert Bushnell Hart. Boston: Ginn & Co. 50 cents.
The Government of the United States. By Bernard Moses. New York: D. Appleton & Co. $1.05.
Elements of Political Science. By Stephen Leacock. Boston: Houghton, Mifflin & Co. $1.75.
Notes on the History and Political Institutions of the Old World. By Edward Preissig. New York: G. P. Putnam's Sons. $2.50.
Civics: Studies in American Citizenship. By Waldo H. Sherman. New York: The Macmillan Co. 90 cents.
Studies in Constitutional History. By James O. Pierce. Minneapolis: The H. W. Wilson Co.

Willard's *City Government* is a good example of how not to write a book for young people. Method there is, but too much of it. A uniformly monotonous exposition, with no concrete examples, no illustrations in the form of pictures or otherwise, and, therefore, no life. Happily, *Lessons for Junior Citizens* is a strong contrast to the former work, being a succession of short stories, interestingly told, and describing the make-up and workings of the various city institutions. The selections are well illustrated and indicate a wide-awake brain, alive to what will catch and hold the young mind.

For the college student, Moses' study of *The Government of the United States,* its origin and its growth, is excellent. The discussions of the various topics are very lucid and followed by the fullest topical references, perhaps a little too advanced for the average student. Especially noteworthy is an inclusion among the topics of that new phase of American government — the dependencies. Roosevelt's letter of instructions to the Philippine Board and an Act of Congress bearing upon it are appended.

Leacock's *Political Science* is more advanced and may well serve as an introduction to political science either in the last year of a college course or the beginnings of post-graduate work. Mr. Leacock is broad in his grasp and suggestive in his criticism. His discussion of the different theories as to the origin of the State commands attention, tho, owing to the uncertain knowledge of the early periods and the difficulty of interpreting the facts, his account of them and his own theory are rather eclectic

and confusing. His breadth of interest is indicated by the fact that one part is completely devoted to the subject of individualism and socialism. Preissig's *Notes* is a history on the lines of Myers, tho fuller and not so convenient.

A series of studies of value to the careful delver into the facts of American constitutional history is to be found in Mr. Pierce's book. It is typical of the lawyer mind that created it. Cautious, conservative and never going beyond the evidence, but here and there very suggestive.

History

A History of Mediaeval and Modern Europe. By Henry E. Bourne. New York: Longmans, Green & Co. $1.50.

Essentials in Mediaeval and Modern History (from Charlemagne to the Present Day). By Samuel Bannister Harding and Albert Bushnell Hart. New York: American Book Co. $1.50.

School History of England. By M. A. Tucker. New York: E. P. Dutton & Co. $1.00.

The Story of Russia. By R. L. Van Bergen. New York: American Book Co. 65 cents.

Ploetz's Epitome of Universal History. Revised Edition. Boston: Houghton, Mifflin & Co. $3.00.

School History of the United States. By Henry William Elson. New York: The Macmillan Co. 90 cents.

The Making of the American Nation. By Jacques Wardlaw Redway. New York: Silver, Burdett & Co.

Essentials of American History. By William A. Mowry and Blanche S. Mowry. New York: Silver, Burdett & Co.

American History in Literature. By Martha A. L. Lane and Mabel Hill. Boston: Ginn & Co. 55 cents.

Heroes of Discovery in America. By Charles Morris. Philadelphia: The J. B. Lippincott Co. $1.25.

Manuals of history, especially of American history, are now coming from the press with more frequency than ever. Few of them can justify their existence by the presentation of new methods or new features of any kind, but they are generally written in a clear and interesting style, and tho the student may be embarrassed in making a choice from such a wealth of material, he will not fare very badly even if he takes at haphazard any of the text-books which rival publishers submit for his approval. It would be difficult, on the whole, to explain, for instance, the development of Europe since the downfall of the Roman Empire more satisfactorily than Professor Bourne does in the volume before us. He passes lightly over the details of wars and diplomacy, and emphasizes the intellectual and economic forces that are really vital in the development of nations. Dr. Harding's work on the same subject is, however, both more original and more attractive as literature. His method is rigorously historical and marked by scientific probity. He is as impartial as he is scholarly in his presentation of disputed facts. The chapters on the organization of the medieval church, the Renaissance and Reformation, especially, are marvels of condensation, while, at the same time, the events described are set forth in a style that is always clear and often picturesque and dramatic. He seems to have a keen intuition of what is really significant in the great movements of the world's history, and particularly of the underlying ideas in the mind of the medieval man. Many of the pictures, of which there is a generous abundance, are taken from medieval manuscripts and are as novel as they are interesting. The book has a number of other valuable features, as, for instance, the specific references at the end of each chapter and their ingenious and useful division into three classes. Mr. Tucker's *School History of England* is written from a very patriotic English standpoint indeed, but has scarcely any characteristics that differentiate it from other compendiums of the sort. In the paragraph dealing with the War of 1812 we are told how the American attack on Canada was repulsed, and of "the brilliant capture of the frigate 'Chesapeake' in fifteen minutes off Boston Harbor," but there is no allusion to what occurred at Lake Erie, Lake Champlain or New Orleans. The first two chapters of the *Story of Russia,* besides containing many inaccuracies, are rather dull. When the author gets on firmer ground he becomes somewhat interesting, altho he lacks the capacity for arranging the mass of knowledge he has accumulated effectively and artistically. *Ploetz's Epitome* has long been regarded as an indispensable reference book. The present edition contains additions covering recent events down to 1903. We notice an error on page 339: "1601. Flight of *Tyrone,* flight of the Earl of *Desmond.*" Desmond had been captured and killed several years before the appearance of Tyrone. Elson's summary of American history will be found adapted to the needs of the general reader as well as of the student. The style has charm, vigor and color, and the author's patriotism is stim-

ulating and communicative. The *Making of the American Nation,* by Mr. Redway, is a book of more elaboration, and pays much attention to industrial development and economic problems, which it discusses intelligently and comprehensively. In the *Essentials of American History* the authors have laid special emphasis on the personal element, and it is a narrative history rather than a mere condensation of events. All young people enjoy a thrilling tale of adventure, and *The Heroes of Discovery in America* will gratify a taste that is universal. These tales are interesting and inspiring, and furnish an adequate notion of what was accomplished in the great work of discovering a continent. *American History in Literature* contains a number of literary excerpts illustrative of the leading events in the development of the United States, which often cast valuable sidelights on characteristic conditions of our history.

Mathematics

Exercises in Geometry. By Levi L. Conant. New York: American Book Co. 50 cents.
First Year Algebra. By Frederick H. Somerville. New York: American Book Co. 60 cents.
Advanced Algebra. By Arthur Schultze. New York: The Macmillan Co. $1.25.
Advanced Arithmetic. By Elmer A. Lyman. New York: American Book Co. 75 cents.

Dr. Conant gives 900 exercises requiring mathematical invention or the application of rules. The value of such work is undoubted. It may be doubted whether too much time may not be given it. Discipline and knowledge along other lines are demanded. A skilful teacher could use the collection in association with current work. Whether its use serves the purpose of a review depends on the object of the review.

An Ideal Group of Lunar Mountains. From Proctor's "Giant Sun and His Family." Silver, Burdett & Co.

The fad for sequences of text books—a series of "some more so's" appears again. Some years ago it took hold of nearly all the text books for schools—mainly for the behoof of the publishers, somewhat to satisfy the *cacoethes pub-*

licandi of teachers convinced of a mission. These efforts in the main waste time and confuse knowledge. They are usually "Mr. Turveydrop in a Kindergarten." They imply two things: (1) The pupils have no common sense or familiar knowledge; (2) Algebra—and the sequent mathematic are alien to both common sense and familiar things. So, often, pages are expended on elaborate alleged explanation of very simple things. The boy or girl of twelve, or even younger, if reasonably well trained, grasps the simple algebraic relations at once. Much "talkee-talkee" confuses perceptions as the sleight-of-hand man conceals his trick. These texts are generally careless in phraseology and often contradictory in statement. On page 142, Professor Somerville states, "The sign of a fraction is *independent* of the sign of its numerator and denominator." On page 144, "the sign of a fraction may be affected by the sign of its numerator or denominator, etc." No doubt the author knows that the sign of the fraction depends wholly on the signs of its terms. How this fraction shall be combined with other expressions is not so dependent. On page 186 one finds the phrase, "will give the probable best solution." In the usage of the old-fashioned pedagog, "Parse probable." In view of the brevity of life, the somewhat elaborate gathering of partialities here considered should be shunned.

The second of the texts on algebra is another added to the large number of books barely justifying their existence. There are many instances in which the presentation of algebraic processes may be much simplified and so more readily grasped. In very few texts is any definite line drawn between elementary and advanced algebra. The forming such a line would clear up much mixedness. Most text-books are afflicted with a mania to tell it all. The determination of the "essential" as against the collateral seems to many either impossible or not worth the while. This text confuses the two with charming freedom. In the five hundred odd pages there is a large amount of material absolutely needless for a pupil having a fair knowledge of elementary algebra. Dr. Schultze has fallen largely into the recent vicious fad of forcing the notion of quantity into the word "number." Often, however, the Doctor's good sense asserts itself in the use of the term "quantity" where it clearly belongs. Great ingenuity has been shown in cramming the idea of "quantity" into the word "number." It is as were the long labors of the Middle-Age schoolmen. There is no gain in the labored distortion. Dr. Schultze's definitions are correct enough, but very mild, and there is rarely proper emphasis on the logical status that the argument hinges on the definition. Very many would change the arrangement as between the text proper and the appendix. On the whole, as for this *Advanced Algebra—cui bono?*

There is a deal of teaching sense as well as common sense with the mathematics of Professor Lyman's little book. The discussion is well proportioned, the definitions are definite, the illustrations are well put, the examples adequate. The glimpses of business arithmetic will be of value as the teacher knows more or less of the business field. The brief discussion of logarithms seems too meager for any real worth. On the whole, the text of Professor Lyman is to be heartily commended for use. It should hold its place in the school course, even when such a crowd of texts demands attention, each having a real or apparent claim.

Physical Science

Physics. By Charles Riborg Mann and George Ransom Twiss. Chicago: Scott, Foresman & Co. $1.25.

A First Course in Physics. By Robert Andrews Millikan and Henry Gordon Gale. Boston: Ginn & Co. $1.25.

Elementary Physical Science. By John F. Woodhull. New York: American Book Co.

Notes on Volumetric Analysis. By J. B. Russell and A. H. Bell. New York: E. P. Dutton & Co. 50 cents.

An Introduction to Astronomy. By Forest Ray Moulton. New York: The Macmillan Co. $1.25.

Giant Sun and His Family. By Mary Proctor. New York: Silver, Burdett & Co. 50 cents.

Two excellent text-books on physics come to us this year from University of Chicago men. Both are intended for third or fourth year high school or Freshman collegiate students. Both are thoroly modern in matter and style and in their educational methods. Professor Mann has made a special effort to make the student realize that physics is a practical subject and necessary to the under-

standing of the operations of daily life. To this end he has abolished such problems as "let the forces *a*, *b* and *c* meet at the point *q*" and substituted real concrete examples of the applications of physical formulæ. He has substituted photographs of modern machinery, such as turbine engines, motors and loop-the-loop, for the antiquated and diagrammatic illustrations of the old text-books. Some of his pictures seem unnecessary and somewhat kindergartenish, but the evil he is striving to avoid, that of making a science too abstract and aerial, is so great that it is best to err on the safe side. Professor Millikan's text book is especially strong in the descriptions of illustrative experiments. He appeals to the human interest by full-page portraits of great physicists of the past and present. Professor Woodhull's smaller book for the seventh and eighth grammar grades dealing with mechanics, fluids and heat, according to the syllabus of the New York City Board of Education, contrasts strongly with the two books from the West. It is very conventional and old-fashioned in its treatment probably from the necessity of conforming with the established educational machinery. The directions for experiments are quite inadequate for the guidance of the pupils.

Professor Moulton gives a most excellent help to the hitching maxim of Emerson. The work, without dealing with more intricate details requiring high mathematical knowledge, goes broadly and clearly over the ground. It would not make an astronomer; but it gives a distinct view of all salient points, such knowledge as an educated man may well have. There is sometimes a tendency to expand verbosely; well for the teacher, perhaps not so in a text. It seems a pity that the Chicago professor should revamp the "apple story." The Isaac Newton apple should be categoried with the other apple of W. Tell and the little hatchet of G. Washington. The work is evidently not a rehash or a patchwork; but out of knowing the subject what is given about Newton and fluxions might well suggest Leibwitz and his differential.

It is often easier to interest children in astronomy than in things nearer to them, for more than any other science it appeals to their extravagance of imagination. Mary Proctor, in *Giant Sun and His Family*, has presented in an attractive way the most striking facts about the solar system, told in a simple way, tho rather overloaded with dates and names and figures. The personal description of the Spanish eclipse expedition of August 30th, 1905, is the most interesting chapter.

Zoölogy

The Biology of the Frog. By Samuel J. Holmes. New York: The Macmillan Co. $1.60.
Entomology with Reference to Its Biological and Economic Aspects. By J. U. Folsom. Philadelphia: P. Blakiston & Co. $3.00.
Text-Book in General Zoology. By Henry R. Linville and Henry A. Kelly. Boston: Ginn & Co. $1.50.
Extinct Animals. By E. Ray Lankester. New York: Henry Holt & Co. $1.75.
The Life of Animals. By Ernest Ingersoll. New York: The Macmillan Co. $2.00.
Familiar Wild Animals. By Silas A. Lottridge. New York: Henry Holt & Co. 60 cents.

The *Biology of the Frog* aims to introduce college students to all phases of zoological study by means of a careful examination of all aspects of the structure and life of the common frog, "the martyr of zoological science." The plan of the book is similar to the now classical "Crayfish: the Study of Zoology," by Huxley. It is a text book intended to supplement suitable laboratory work. In addition to its place in colleges, it will be a useful reference work for the biological laboratory in high schools. Folsom's *Entomology* differs from the well-known Comstock's "Manual of Insects" and Kellogg's "American Insects" in that these are especially concerned with classification, while Dr. Folsom omits this, and deals chiefly with the commonest insects, as they serve to illustrate the economic and biological principles of insect life. The book is really a biological entomology, dealing with the anatomy, physiology, embryology, adaptations, origin of species, relations to plants and other animals, psychology and distribution. It is designed as a text-book for students intending to specialize in insects, but it is well adapted to general readers who want books on insects more advanced than the small popular works. Linville and Kelly's *Zoology* is a text-book to accompany laboratory studies in high schools. It has many good original points, and deserves recommendation as

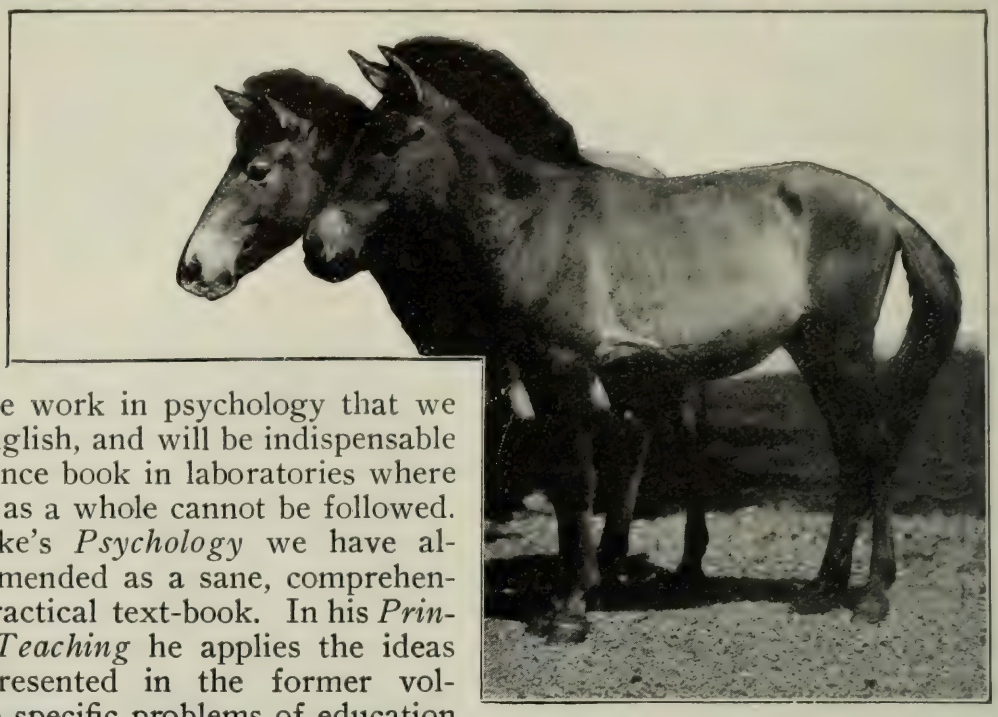
one of the very best books yet published in this line. There are over two hundred excellent illustrations. Every high school and biological laboratory should have reference copies, even tho some other book is already adopted as the regular text-book in zoology.

Extinct Animals, by the director of the natural history department of the British Museum, is neither an elementary text-book nor a technical treatise, but simply a popular book which describes various fossils in the world's greatest museum and points out the leading facts now known concerning the animals which existed in the far-distant past. The book will be interesting and perfectly intelligible to children of high-school age, but even the general reader of mature years will find much to claim the interest. Ingersoll's *Life of Animals* is misnamed, for it is simply a natural history of common mammals. To describe it briefly, but yet with accuracy, it contains just the information about living and extinct species of mammals, especially those most familiar, which the general non-zoological reader demands. The reviewer regrets that when he was a boy of twelve to fourteen years this book was not then written, but he is now making up for lost time by spending many pleasant hours reading this interesting book. *Familiar Wild Animals* is a selection of sketches and photographs from the author's "Animal Snapshots." It is intended to stimulate the interest of children in some common birds and mammals.

Physiology and Hygiene

Experimental Physiology and Anatomy. By Walter Hollis Eddy. New York: American Book Co. 60 cents.
Nature and Health. By Edward Curtis. New York: Henry Holt & Co. $1.25.
The Health Culture Readers. Nos. One and Two. By the Author of "Preston Papers." New York: Hill & Evans. 50 cents.
Good Health for Girls and Boys. By Bertha Millard Brown. Boston: D. C. Heath & Co. 45 cents.

Eddy's *Physiology and Anatomy* is a guide to practical work in connection with study of the human body in secondary schools. With this and other good guides now available there is little excuse for a purely text-book course in "physiology." *Health Culture Readers* are to be classed with dozens of similar health books which are written and published merely to sell, and not because the author has something new and valuable to write. *Nature and Health* is a very readable book on hygiene of the person and home. It is full of good advice, and usually in striking form. For example, in concluding a good discussion of overeating: "Fine fare leads to feasting, feasting to fat, fat to degeneration, degeneration to death, 'all as the sparks fly upward'." *Good Health* is a first-class reader in hygiene for pupils in the elementary schools.



Psychology and Education

Experimental Psychology, Quantitative. By Edward Bradford Titchener. New York: The Macmillan Co. Student's Manual, $1.40; Instructor's Manual, $2.50.
The Elements of Psychology. By Edward L. Thorndike. New York: A. G. Seiler. $1.25.
The Principles of Teaching Based on Psychology. By Edward L. Thorndike. New York: A. G. Seiler. $1.25.
Elementary Pedagogy. By Levi Seeley. New York: Hinds, Noble & Eldredge. $1.25
The Mind and Its Education. By George Herbert Betts. New York: D. Appleton & Co. $1.25.
First Steps in Mental Growth. By David R. Major. New York: The Macmillan Co. $1.25.
An Elementary Logic. By John Edward Russell. New York: The Macmillan Co. 75 cents.
Course of Study in the Eight Grades. Vols. 1 and 2. By Charles A. McMurry. New York: The Macmillan Co. 75 cents each.
The School and Its Life. By Charles B. Gilbert. New York: Silver, Burdett & Co.
The Recitation. By Samuel Hamilton. Philadelphia: J. B. Lippincott & Co. $1.25.
Methods in Elementary School Studies. By Bernard Cronson. New York: The Macmillan Co. $1.25.
Dynamic Factors in Education. By M. V. O'Shea. New York: The Macmillan Co. $1.25.
A Text-Book in the History of Education. By Paul Monroe. New York: The Macmillan Co. $1.90.
Pioneers of Modern Education. By John William Adamson. New York: The Macmillan Co. $1.50.
Great Pedagogical Essays, Plato to Spencer. By F. V. N. Painter. New York: American Book Co. $1.25.
The College Man and the College Woman. By William DeWitt Hyde. Boston: Houghton, Mifflin & Co. $1.50.
Citizenship and the Schools. By Jeremiah W. Jenks. New York: Henry Holt & Co. $1.25.

Professor Titchener follows his manual of qualitative experiments in psychology with a similar work on quantitative experiments. Like the former, it is published in two parts—one volume for teachers and one for students, but it must not be thought the former is like the "keys" which teachers used to keep locked in their desks, so they could tell when their pupils got the right answers. The "Students' Manual" contains detailed directions, with descriptions of apparatus for twenty-eight experiments, covering most of the methods used in research work. The "Instructors' Manual" discusses the scientific value of the experimental results and the literature of

the subject. A large part of this volume is devoted to a thoro criticism of Weber and Fechner and their critics. Professor Titchener's is the most complete guide to quantitative work in psychology that we have in English, and will be indispensable as a reference book in laboratories where the course as a whole cannot be followed.

Thorndike's *Psychology* we have already commended as a sane, comprehensive and practical text-book. In his *Principles of Teaching* he applies the ideas he has presented in the former volume to the specific problems of education in the same clear and practical manner. It is a good book for normal school classes, and its numerous and apt questions and exercises will be found provocative of profitable discussion in teachers' meetings and institutes. Professor Thorndike's work in the statistics of education enables him to prick many time-honored fallacies and to throw new light on such points as the grading of pupils by examination and the value of disciplinary studies. Seeley's *Elementary Pedagogy* is less original and suggestive, but is a sensible and useful little book. Betts's *The Mind and Its Education* covers in a general way the whole field of psychology, but without adding anything especially novel and interesting in matter or treatment. The style of the popular lectures in which it originated is largely retained. *First Steps in Mental Growth* is a detailed record and study, after the manner of Preyer, but with the advantages of the work that has been done since, of the mental development of Professor Major's son. In his *Elementary Logic* Professor Russell has cut away much of the oppressive systemization and historic terminology that weighs upon the subject, but otherwise has followed the conventional lines.

Przewalsky's Horse, from specimens now in the New York Zoölogical Gardens. The nearest living representative of the primitive wild horse. From Ingersoll's "Life of Animals." Macmillan.

The pressure brought upon the school to include a variety of new subjects has forced teachers to the study of correlation. Each subject, new and old, is challenged to prove its right to existence in the curriculum and tested for its real educational value by the methods of modern psychology. Our educational machinery has to be made more compact and efficient, and McMurry's *Course of Study in the Eight Grades* tells how it is being accomplished. The author gives in detail just what ought and can be done in each grade by a judicious combination of the policies of enriching and pruning. He is not a man of one idea, but is open-minded and progressive in all lines. The very full and carefully selected list of text-books and side reading for each grade are especially valuable, and would be a safe guide for school-room libraries. Gilbert's *The School and Its Life* deals with the whole subject of school management and organization. If the pupils, the parents, the teachers, the principals and the superintendent followed all the good advice he gives it certainly would be a model school. It is a sensible and practical book. *The Recitation* has the unusual defect of too modest a preface by the author. The book is, as he says,

easy reading; that is, the technical nomenclature of psychology has been wisely discarded, but it has also in a high degree the virtues the author disclaims—thoroness, comprehensiveness and logical arrangement. His discussion includes all phases of the recitation, from the preparation of the work to the hearing of the pupils, and his points are put so they will be readily grasped and long remembered.

Modern education differs from the old especially in that the child being made to take a more active part in his own training. Pupils are no longer looked upon as tumblers, all alike and standing in a row, to be filled from the teacher's pitcher of passively acquired knowledge. But the claims of the advocates of "motor education" are often so extravagant that a fair and comprehensive book like O'Shea's *Dynamic Factors* is very timely. It is sound psychology sensibly applied. The discussions of the value and limitations of manual training and of the cause and prevention of fatigue are the most important parts of the book.

On the history of education, the most important book of the year is that by Professor Monroe, of Teachers' College, Columbia University. Within the compass of one volume of 750 pages he has given a very complete and comprehensive sketch of education, beginning with the Chinese and ending with the American public school. To prevent the survey of this immense field from becoming too diffuse and impersonal, he has, wherever possible, centered the discussion of each movement about the individual who was its leading exponent. A more detailed study of the educational history of the seventeenth century is given in Adamson's *Pioneers of Modern Education*, which covers the interesting period when the system of medieval scholasticism was breaking down under the joint influence of the new Baconian ideals and of broader commercial and political needs. Better than overmuch reading about the great educational leaders of the past is to read directly what they wrote. This any one can now do in the convenient volume of *Pedagogical Essays*, which contains selections from twenty-six authors, some of them not easy to get in any other form. It is corrective of our conceit over "the new education" to read these essays and see that great minds in all ages have charged the schools of their day with much the same defects we now complain of, and have advocated methods very similar to those we hail as the discoveries of recent years.

Two volumes of addresses and essays on educational topics must be mentioned before concluding this list of books interesting to teachers. President Hyde's sympathetic and inspiring discussion of the religious, political and social problems which perplex *The College Man and The College Woman* of the day should be put upon the open shelves of every library. Professor Jenks's sane and readable essays deal with a variety of topics on boundary of the school and the outside world, particularly with the important question of school training for citizenship and commerce.

Miscellaneous School Books

SPANISH.

Valdés' Capitan Ribot. Edited by Frederick W. Morrison and Philip H. Churchman. Boston: D. C. Heath & Co. 40 cents.

Flores de Espana. Edited by C. Fontaine. New York: American Book Co. 45 cents.

COMMERCIAL.

Comprehensive Bookkeeping. By Artemas M. Bogle. New York: The Macmillan Co. 90 cents.

Commercial Correspondence. By Albert G. Belding. New York: American Book Co. 50 cents.

GEOGRAPHY.

Commercial Geography. By Henry Gannett. Carl L. Garrison and Edwin J. Houston. New York: American Book Co. $1.25.

Geographical Reader—Africa. By Frank G. Carpenter. New York: American Book Co. 60 cents.

Geography of Science. By Tarr & McMurry. New York: The Macmillan Co. 60 cents.

How We Are Sheltered. A Geographical Reader. By J. F. Chamberlain. New York: The Macmillan Co. 40 cents.

ENGLISH READERS.

The Silver-Burdett Readers. Five Books. By Ella M. Powers and Thomas M. Balliet. New York: Silver, Burdett & Co. 25 to 55 cents.

Language Readers. First to Sixth Year. By Franklin T. Baker, George R. Carpenter and Katherine B. Owen. New York: The Macmillan Co. 25 to 60 cents.

Graded Poetry Readers. Nos. 1 to 6. By Katherine D. Blake and Georgia Alexander. New York: Maynard, Merrill & Co. 20 cents each.

Eclectic Readings. Waste Not, Want Not Stories. By Clifton Johnson. The Golden Fleece. By James Baldwin. Thirty More Famous Stories Retold. By James Baldwin. Robinson Crusoe. By James Baldwin. New York: American Book Co.

The Page Story Book. By Frank E. Spalding and Catherine T. Bryce. New York: Charles Scribner's Sons. 50 cents.

Old Tales from Rome. By Alice Zimmern. Chicago: A. C. McClurg & Co. $1.25.

Days and Deeds a Hundred Years Ago. By Gertrude L. Stone and M. Grace Fickett. Boston: D. C. Heath & Co. 50 cents.

American Hero Stories. By Eva March Tappan. Boston: Houghton, Mifflin & Co. 55 cents.

College and Seminary

BY WILLIAM DE WITT HYDE, D. D., LL.D.

AN ADDRESS TO UNION THEOLOGICAL SEMINARY BY THE PRESIDENT OF BOWDOIN COLLEGE.

THE religious world stands today before a great fixed gulf. It was always there; but hitherto has been evaded, concealed or bridged. On one side of this gulf is tradition; on the other truth; on one side the servile repetition; on the other free invention; on one side imitation of the dead letter; on the other reproduction of the living spirit; on one side constrained assent to doubtful ideas; on the other joyous response to compelling ideals; on one side extraneous revelation attested by miraculous credentials; on the other original righteousness appreciated by the pure in heart; on one side static legality; on the other dynamic love; on one side the sanctity of self-centered isolation; on the other the sacredness of sacrificial service; on one side passion, hope of a better world hereafter; on the other active work for the betterment of conditions here; on one side dubious proofs of the existence of God as a formulated proposition; on the other triumphant demonstration of His unfolding presence in the pure home and the true school, the honest work and the fair trade, the clean city and the just State.

Of course the same external fact may be both traditional and true. But between the attitude of mind which accepts a proposition on the authority of ecclesiastical tradition and the attitude which demands scientific evidence of its historical truth there is no compromise. Between these two attitudes the great gulf is fixed.

To be of any use a discussion of the college and the seminary must locate these institutions with reference to this gulf. Each of these two institutions may be on either side of it. That gives us four things to describe: the college of tradition, the seminary of tradition, the college of the truth and the seminary of the truth. Between these there are four possible combinations: (1) the college of tradition with the seminary of the truth; (2) the college of the truth with the seminary of tradition; (3) the college of tradition with the seminary of tradition; (4) and the college of the truth with the seminary of the truth.

First: The college of tradition has a fixed curriculum composed mainly of dead languages and changeless mathematics. On this skeleton are hung a few brief text-book courses in elementary science. On top of it all is placed a course in the evidences of Christianity, aiming to prove by what is found in the world a God who never can be found outside it, and to confirm the student in the childish views of religion he brought with him from the nursery and the Sunday school.

The effect on the students is obvious and inevitable. For a good account of it read in Andrew D. White's autobiography the story of the idleness and dissipation in the church college he attended before he went to Yale. Of course all the virile, vigorous fellows in such an institution plunge into dissipation. What else that is genuine and interesting is there for them to do? While the strong and vigorous majority of the boys in such an institution go straight to the bad, there will be a feeble remnant who meekly swallow the predigested intellectual food; and for the sake of its sugar-coating of prizes and scholarships profess to like it. Out of the most feeble in this weak minority the candidates for the ministry are drawn. They have

never done a bit of original thinking or independent acting in their lives. They are leaners on their teachers; they never can be leaders of their fellows.

The seminary of tradition is tenfold more the child of this same docile unreality. Dead languages again, the deadest of the dead, are the spinal column of the seminary course. The student must be taught the exact words in which the miraculous and final revelation was deposited. Church history is the cut and dried narrative of the perfecting of the precise views and ceremonies and institutions of the particular denomination to which, in the Providence of God, the student and the seminary happen to belong. Dogmatics will be injected by authoritative dictation; lest, if taken by the method of reading, discussion and reflection, some precious particle might be regurgitated, which would be evidence of dangerous heresy. Homiletics teaches the student to repeat in diluted popular form what he has heard in concentrated technical terms. Add a few points about raising money for foreign missions and home expenses and the proper length of pastoral calls, and the seminary of tradition is ready to present its graduate for ordination.

Next: What is the college of truth? What shows that a college is on the right side of the gulf? For admission, and for a portion of the early years, it requires that discipline in conformity to fixed forms of truth, which is the foundation of the old and the new education alike. On this basis it opens up a world of natural and human interests. It tests its science in the laboratory. It sifts historic evidence in the library, and discounts prejudice and personal equations. It feeds the imagination on literature, and teaches the difference between fact and fable, poetry and prose, wherever found. It portrays the economic struggle where the weak are crushed and the strong take unfair advantage. It shows the tragedy of ethics, as the sacrifice of the large goods, of the soul and of society for the petty gains of selfish and sensual indulgences. It offers the life of intimate fellowship with congenial friends in an atmosphere of freedom. It trains in honorable struggle in athletics and debate. It holds up in lecture room and chapel great men and great motives for admiration and emulation.

Some men go thru even such a college and come out untouched. But those who catch its spirit learn to know and love truth and to be free and fearless in its pursuit. They learn admiration for personal greatness and sympathy for human need. They acquire the impulse to share the best they have with those who have it not. The many go into the active business of the world, to become centers of light and good will in quiet, unnoticed ways. Some of the more earnest and thoughtful aspire not merely to live out this spirit of truth and liberty and service themselves, but to carry the conscious principle and spirit of it to their fellows. These are the men who enter the ministry out of the college of the truth. And the call of God comes to them, not thru conventional experience or traditional notions, but thru the vision of God's great goodness in nature and history on the one side and man's dire need in his economic, moral and spiritual life on the other, and the desire to stand between the two as the medium thru whom God's abounding grace and goodness shall go forth to meet and redeem man's suffering and wrong.

Fourth: What is the seminary of the truth? And what is its life and training? It will teach Greek and Hebrew—not necessarily, however, to every student—and in so far as it does it will aim, thru them, to teach the precious record of those typical experiences in which great, original souls went forth to do in their day and their way the same splendid work of righteousness and service which the minister is to help men to do in novel ways under the vastly different conditions of today. Even Christ will be valued, not chiefly for his pre-natal and post-mortem experiences; nor yet exclusively for the specific examples he set and the particular precepts he laid down; least of all for the notions other men have held concerning him and hardened into Christologies; but the students will study him for the personality that spoke thru his words and shone thru his deeds, that they may learn to think thoughts and do works as perfectly fitted to the complex conditions of our modern life as were his thoughts and deeds to the sim-

ple conditions of his Judea and Galilee. They will follow him, not as servants of an arbitrary lord, but as friends of a supreme friend, in absolute freedom of thought and originality of service, according to the problems of the hour and the needs of their day and generation. Dogmatics will be the attempt to formulate the appreciation of God's goodness and man's need; and the processes and methods by which the one can be made effective for the help of the other; and to describe the steps by which man, lost in sensuality and materialism, returns to his spiritual heritage in the Father's home. Church history will trace the many ways in many lands and ages in which the conquest over evil has been won and the kingdom of love adapted to different races and temperaments, different stages of culture and types of political organization. Homiletics will aim, not at training pulpit orators, but at making men so alive with truth and love that the Gospel will shine thru all they say and do. Side by side with these subjects, the seminary of the truth will study the great masters of secular literature, the conceptions dominant in science and philosophy, and the economic and social needs of men. Not until the student knows the words and deeds, the men and institutions by which God's goodness has expressed itself in days gone by; not until he knows these things in their relations to the current problems and urgent needs of the men and women of today; not until he is prepared to bring these things to bear on each other in thoughts that are original at least in their immediate application; in deeds the exact like of which were never done before; in institutions and agencies no precise pattern of which was ever revealed in any mount; not until then will the seminary of the truth offer its graduates as candidates for ordination to the Christian ministry.

Thus we have the four institutions: The college of tradition and the seminary of tradition; the college of the truth and the seminary of the truth. Now let us consider the four possible combinations.

First: You may try to send a student from the college of tradition to the seminary of the truth. What is the result? His contracted lungs cannot breathe the freer air. He is confused and confounded. His faith seems to be slipping from him. With the backing of his pastor, or some presbytery or house of bishops, he brings charges of heresy against his seminary professors. The result is unpleasant, but on the whole does little harm. A few students who were never fit to enter the ministry any way are diverted from the profession to its great advantage; or, if the seminary is so unfortunate as to be tied to a creed or tethered to an ecclesiastical body, a professor or two may be removed. It is hard for the professor; but the men who are sacrificed in this way are comparatively few and the colleges usually are glad to pick them up.

Second: We may have the college on the side of light and liberty and the seminary bound in darkness and tradition, and then try to send students across the gulf. The difficulty is that few students will go from such a college to such a seminary; and the few who go will not stay long after they get there. I speak feelingly on this point; for I came from the reading of Lyell and Darwin; from the study of history without text-book or formal lecture, and from three years of reading of Descartes, Locke, Berkeley, Hume and Kant at Harvard, to Union Seminary at a time when a system of theology concocted before modern philosophy was born was crammed down the throats of the students. That is why I remained but one year, and have not the honor to be an alumnus of Union Seminary today. A man who was at Union from Yale at the same time is now the bitterest infidel I know. You cannot make him believe Christianity is anything but a gigantic fabric of priestly and professorial lies. I fared little better, so far as philosophical theology was concerned, at the seminary to which I went. I never heard a fundamental question get a serious and square answer from Professor Park in all the time that I was there. Things have changed since then at both institutions; but the majority of theological seminaries are still so wedded to indefensible traditions that no intelligent graduate of a college of the truth can enter there and long remain. Over their entrance is written in Greek and Latin and Hebrew the superscription: "Let none but the scribe of the letter, the pharisee

of tradition, the hypocrite who is ready to believe in absence of sufficient evidence; let none but these presume to enter here."

These two combinations, the college of tradition with the seminary of the truth, and the college of the truth with the seminary of tradition are practically impossible. The institutions are on opposite sides of the great gulf, and the students who try to cross it fall into the abyss.

The last two combinations, the college of tradition with the seminary of tradition and the college of the truth with the seminary of the truth, are both practicable, tho leading, of course, to diametrically opposite results.

The man who has graduated from a college and a seminary, both bound in tradition, knows absolutely nothing of what the world is thinking about and what people want. He moves about in worlds not realized. He is safe and sound, but useless and juiceless. He can doubtless comfort a few sisters weaker than himself; and even thru so dry and dead an instrument the grace of God sometimes contrives to make itself felt. When the ink in his note-book grows dim, and the memory of his professors' words fades out, the minister trained in these two institutions becomes an easy victim of those patent homiletical medicines which publishing-houses in this and other cities put up. For less than thirty pieces of silver they will sell him insincerity enough to last him a lifetime, and ruin his moral constitution forever; and when they have done it they have not, like Judas, the grace to wind up their business and go hang themselves. Trained in both institutions to lean and not to lead, the graduate remains a leaner, not a leader, to the end; and the end generally comes a little this side of the age of fifty. It is a mistake to call that age the dead line, however. Ministers who graduate from such institutions are dead the day they graduate; while a minister who is once really alive can never die to useful and honorable service.

There remains the fourth and last combination: the college of the truth with the seminary of the truth. There are in the United States scores of colleges of this type and half a dozen or more seminaries to match them. Happy the candidate for the ministry who gets his training in both institutions of this type. Keenly sensitive to the standards of intellectual honesty; warmly alive to the problems and troubles of actual human life; thoroly acquainted with the natural and economic and ethical laws which underlie the world, as a result of his college course in the seminary, he adds to all that an intimate acquaintance with the Master and the men, the literature and the life, the methods and institutions thru which the simpler spiritual problems in the childhood of the race were solved, and gains the power to apply the spirit and principle of those typical solutions in original and masterful ways to the infinitely more complex problems of strenuous modern life. Such men speak with authority and not as the scribes. Such men are qualified for spiritual leadership. Such men will lift the profession of the ministry from its low estate to the position of deepest usefulness, and therefore of highest honor in society.

One question more. The world unquestionably is hungry for just such spiritual leadership. Is the Church yet ready to accept such leaders, and give the world such honest and effective leadership? Or are the men who manage the ecclesiastical machinery, both clerical and lay, hopelessly given over to the idols of unverifiable tradition and irrational authority. Are they still strong enough and perverse enough to keep out of the ministry all men more progressive, more honest, and therefore more effective than themselves?

That is the question the graduate of a college of the truth asks himself before he risks the next three years of his life in a seminary. Not very many days ago I received a letter from a graduate of my last class. He was one of our most thoughtful and earnest students. He came at once to New York and entered upon social and philanthropic work. Within three months he was promoted to be the head of a social settlement in one of the great cities of the Middle West. From this settlement where he now is comes the following letter. Here is a man right between college and seminary, frankly expressing his desires and his doubts, his hopes and fears. He

has come face to face with the hard facts of the world of human sin and suffering. He has felt the forces of materialism so keenly that, like Elijah, he almost doubts whether any form of spirituality is real and worth while. Still, he is drawn with a divine yearning to do for men a spiritual work which he sees that material means alone never can accomplish.

"The problem confronting me is, Shall I enter the ministry or no? For some time I have seriously considered such a move, altho I have been unable to reach a satisfactory decision either one way or another. In fact, I have delayed the determination of the point, waiting for something to decide for me. But, like Mahomet, finding that the mountain does not come to me, I must go to it.

"The reasons why I think of becoming a clergyman are not many. I have a natural love for such work, far greater than for any other. I think I might meet with moderate success. The field is in imperative need of strong, broad men.

"But such arguments seem flimsy when placed over against the array that point to some other life work. Wealth is perhaps the means wherewith we can do the greatest good in the world, and if I set about business with the notion of becoming wealthy I can accomplish that end. Moreover, perhaps it is a duty to my father and mother and brothers and sisters to succeed in business. By so doing I should have the means with which to repay the noble sacrifices they have made.

"Sometimes, too, I feel that clergymen and altruistic workers are working with a false impression; that their influence really amounts to nothing; that the only thing that counts is to do tangible things. Again, the church is so narrow that I am not sure that I should be allowed to do my best, to speak honest truths, to organize for social betterment, to be active in everyday ethics and progress. My own beliefs in matters of theology and doctrine are so radically heretical from the standpoint of the creeds that I might be smothered and unable to accomplish anything. And last, but not least, I would have great difficulty in training myself to present a respectable stage appearance and learning the art of effective speaking."

Here we see a great gulf inside the young man's mind. To lead his fellow men in the joy and blessedness, the service and sacrifice of the Christian life, is what he longs to do above all else. For the sake of it he is willing to trust that the power to speak will come; take his chances on making the intangible things of the spirit as real as the tangible forces of sense; forsake the sure prospect of wealth and the dear ministry in material things to father, mother, brothers and sisters. All this sounds strangely like Jesus's tests of discipleship.

Yet this young man has doubts; doubts about the traditional creeds and doctrines which he regards as a matter of course; more serious doubts whether spirituality can be made effective against the vast momentum of materialism; doubts about the willingness of the church to hear and follow a frankly honest man.

You may say this last doubt is superfluous. Two tramps approaching a house were met by a furiously barking dog. One started to run. The other said, "Don't you know barking dogs never bite?" "Yes," said the other; "you know it and I know it, but the dog doesn't." You know and I know that there are many churches that want an honest and fearless minister. But the young men don't know it and the heresy trials don't help them to find it out. They believe, rightly or wrongly, that the ecclesiastical machinery is mainly in the hands of the same sort of men that held it in Jesus's day; men who will neither look truth fairly in the face themselves nor suffer any man who does to enter the official service of the churches they control.

The church can have all the strong, broad, forceful, devoted ministers it needs and wants, provided it will permit them to stay on the side of the gulf where the true college and seminary lands them. Does it want such men enough to make personal loyalty and love to Christ, moral integrity and intellectual sincerity, social service and self-sacrifice, the sole tests of its membership and ministry? If not, the decline in quantity and quality of its ministry will be the first step toward its dissolution in favor of some form of spiritual life more simple, more sincere, more serviceable, more essentially Christian.

Brunswick, Me.

The Museum as a Factor in Education

BY HERMON C. BUMPUS, Ph.D.

[Dr. Bumpus is President of the recently formed American Association of Museums and since 1902 has been Director of the Museum of Natural History in this city, where, with the coöperation of the Board of Trustees he has put into practice with great success the ideas discussed in the following article. Dr. Bumpus held a professorship in Biology in Brown University—his Alma Mater—from 1889 to 1891, and was Director of the Biological Laboratory at Wood's Holl from 1901 to 1902. He has contributed numerous articles on biological subjects to the reviews and has published one volume, "A Laboratory Course in Invertebrate Zoölogy."—EDITOR.]

WHEN business men like Morris K. Jesup and J. Pierpont Morgan in New York, Marshall Field and H. N. Higinbotham in Chicago, and Andrew Carnegie in Pittsburg, have devoted themselves to the upbuilding of museums, it is because of a deep-seated conviction that institutions of this kind are of value to the community; that money provided for their support is safely invested, and that time, thought and energy devoted to their development are wisely expended.

The museum has long existed as a repository for objects of art and natural history, and, as such, it has without doubt exerted a beneficial influence upon the culture of the community, and it has certainly stimulated in some a respect for and in others a real love of science, but only recently have museums become aggressive educational agents, and it is only within a few weeks that museum curators and officers in this country have formally come together for the purpose of discussing methods whereby museums can extend their usefulness.

The general condition is somewhat peculiar, since, to a certain extent and at the present time, the financial support of museums has anticipated their educational activity. If we add together the funds now practically available for museum purposes in the four cities—New York, Chicago, Pittsburg and Washington—we discover that, during the next five years, probably at least $25,000,000 will be expended. This sum is remarkable when we consider that museums as direct agents of popular education are still in their infancy. Moreover, the amount is practically an endowment, provided, as just stated, not so much in recognition of work done as in expectation of work to be done. This sum becomes a trust that will place heavy responsibilities upon those who may be called upon to fill fiduciary, advisory and executive positions, since many new problems will arise, specialists are few, and no university is training men for strictly museum work.

The field open to the museum is a large one. The educational work of the public school is restricted to children; that of the college is open only to students who can begin with the fall term and continue uninterruptedly with members of a common class. Both school and college are possible only to those who can attend regularly. The museum as an educational means is open to youth and adult alike. Its silent teaching is continuous, and the period of instruction is limited only by the desire of the visitor. The workman and clerk are not permanently debarred from continuing their studies because of temporary absence, and they may come and go without interfering with the sources of information and without disturbing their companions.

Different people learn in different ways. One person learns only when deliberately taught; another acquires knowledge by reading; another absorbs information from illustrations; others gain information by observation. In these processes we may confuse information with education and education with culture, but the effort for self-improvement is common to all, and the recognition of this effort is the *raison d'être* of the progressive museum.

The traditional museum for a long time was hardly a place of attraction. The dusty minerals, dingy birds, grue-

some mammals and sophomoric labels may have been of remote educational value to a few, but hardly worthy serious attention as potent educational agents for the many.

The modern museum should be an expression of its own environment, and it should exist in response to environmental demands. The museum at Plymouth is strongly historical. The museum at Cambridge is appropriately of comparative zoölogy traditional of the activities

The American Museum of Natural History.

of Agassiz. That at Salem shows the influence of the remarkable shipping industries of the latter part of the eighteenth and early part of the nineteenth centuries; that at Yale is geological; that at Washington indicative of the scientific, industrial and material progress of the nation. A museum for a city like Fall River, where people are more generally interested in textiles, should be different from a museum in Gloucester, where there are various marine industries. Not that museums should be solely technical, but the general environment of any educational institution is a matter for the consideration of those who have its best interests at heart. The museum in a great city like New York or Chicago should differ in other respects than mere size from what are known as provincial museums; but all museums, wherever located, and whether primarily for art, science, industries or history, should be architecturally attractive, should present a cleanly appearance, should be so administered that printed notices of prohibition are unnecessary, and the material exhibited should be installed in such a way that the visitor finds satisfaction and profit in the serious contemplation of a little rather than fatigue and disappointment in the superficial examination of much.

Since his election to the presidency of the American Museum of Natural History in New York, twenty-five years ago, Mr. Jesup has striven to develop an institution that, while maintaining the highest scientific standards and contributing actively toward the support of scientific

investigations, should at the same time present in an intelligible way the essential facts of natural history. His insistence that the installations shall be so labeled as to leave no doubt as to their significance, and shall be such that "a common man may understand," coupled with the vast amount of material that has resulted from numerous exploring expeditions and large purchases, has given to this institution a distinctively educational equipment, which is generally recognized in the community.

Merely looking at things gives little educational profit. A farmer may spend his entire life among plants, and until he reads he may obtain no educational results therefrom. A boatman may dwell on the shore, and until he receives the stimulus of information he may acquire no knowledge of the peculiar animals and plants of his region. In a museum specimens may surround the visitor, but in the absence of proper descriptive matter he may derive nothing that will add materially to his fund of knowledge. The exhibition hall that is merely filled with specimens — *scientifically* labeled, it is true—may be absolutely sterile. It is like a library, the books of which are locked. Can one learn of chemistry by viewing labeled bottles? Can one learn of history by examining portfolios of portraits? Does one profitably study art by inspecting plaster casts?

How most effectively to bring out the educational value in exhibited material is easily the most important question of museum administration. If the exhibition halls are merely for specimens, if they are for storage, it is well to stop. If they are for the demonstration of fundamental principles, if they are for the elucidation of ideas, if they are for instruction, it is safe to go ahead.

Let us have an example: Suppose it is the purpose of a curator to illustrate the "culture" of a certain remote tribe of people. Educational ends will not be subserved by merely placing a collection of pottery within a case, labeled with the name of the tribe, its geographical position, and the name of the collector, altho pottery may be the museum's sole possession from this particular people. The curator feels that he should acquaint the visitor with the entire range of activities of the tribe under treatment, and it is for this purpose that he has posted himself upon the literature of his subject. Thru travel and correspondence he knows of the collections of other institutions. He estimates the amount of case room that he can appropriate; he thinks out his problem of installation, and it may be that he writes up his descriptive matter without direct reference to any specimens whatever. He is planning an exposition of the *culture* of a certain people; he is not providing space for the exhibition of certain *specimens*. Finally it will be his purpose to illustrate his treatment of this culture with well-selected specimens, photographs and models, wherever these may be procured. Information bearing upon a certain culture is the essential thing. Specimens, etc., that will serve to illustrate this culture are important, but secondary. Collections may be scant, but if a subject is worthy serious attention the information that the museum supplies thru its specimens, labels, printed matter, descriptive photographs and models, should be such as to satisfy any normal craving. In following out this principle, progressive museums are not now striving to exhibit exhaustive collections as such, but they are developing their laboratories—rooms "not open to the public"—where serious students who wish to consult large ranges of specimens may find an easy entrée and willing assistance from capable officers in charge.

Subjects that are of immediate interest to working men of science are not necessarily of interest or appropriate for the instruction of the visiting public; indeed, there is some danger that the instruction of the visiting public may be far above the comprehension of the average visitor. The better class of text books and the scientific subjects that receive attention in the best magazines, and their treatment by successful writers and editors, give strong hints of the capacity of the average seeker for information and the way in which a subject may be adequately handled. A good article may be smothered by a surplus of unimportant and irrelevant photographic reproductions, and the entire meaning of an installation may be obscured by yielding to an inordinate desire to exhibit everything. The room designed for children

at the National Museum, and containing a few admirably selected objects, is most eagerly sought by adults. In museum work the path of simplicity is the path of effectiveness.

The direct educational efforts of museums do not stop in the exhibition halls. Publications of a popular nature are regularly issued, which are designed to interest and instruct those who may find it impossible to visit the collections regularly. Photographs are supplied to foreign publications. Scientific papers are issued containing the results of the investigations of members of the staff, either at home or in the field, and reference libraries are maintained. Public lectures, both to adults and to children, are frequently delivered. Appointments are made with classes of the public schools, and traveling collections are prepared and kept in circulation.

Any one of these subjects requires the closest attention of those who have such work in charge, but the combined results are such as to justify the belief that the museum is effectively establishing itself among the regularly recognized educational agents.

NEW YORK CITY.

Impressions of Oxford

BY H. G. MERRIAM

RHODES SCHOLAR FROM WYOMING.

IT has been said that England is the garden-spot of Europe, and Oxford the garden-spot of England; this may be true, for Oxford is about as beautiful as one can conceive. The beauty, however, is tame and civilized; there is no rugged nature, as yet undefiled by human touch; no wild scenery, laughing to scorn the conceited attempts of man. Oxford is a quiet, beautiful, prudish spot and appropriately in it is situated a quiet, beautiful, prudish university; a university steeped and fossilized in classic lore; a university of five hundred years ago, externally altered to suit the needs of a vigorous, but non-demanding youthful generation. Oxford and the university —the two fit exactly together. Because of its steadiness and conservatism thru all its history, all its excitements of changing centuries, all its vexatious troubles of superstitious ignorance, religious revolutions and persecutions, despotic sway and wilful authorities, because

An Oxford-Cambridge Cricket Match.

The Oxford Crew and Boathouse. Taken at the Last Practice Before the Race with Cambridge.

of these Oxford is the city most suitable for a sturdy, steady, conservative university.

Thru all these vicissitudes Oxford University remained standing firm by the ancients, changing as little as possible, reluctantly adding the new branches of study as discoverers and promoters pointed out and developed them. Today we find Oxford proudest by far of the universities of the world in her lore in Greek and Latin, ancient philosophy and history. Rightly is Oxford proud of her learning. The intellectual center of the world it is; the center of cobwebbed learning, of dust-stained classics. We are glad it is so, and in all probability will remain so. Fortunate indeed is he who can taste of old Oxford, who can live a medieval life in a modern way, a modern life in a medieval way, who can imbibe traditions, and customs, and knowledge from the fountain-source of centuries of cultured life and inculcated learning. Fortunate is he, who, standing on the scene of the event, can imagine an unflinching Cranmer martyred for his persuasions, an Empress Maud stoutly defending her castle on the Thames, a pious Wesley working out his plan of Methodism in Lincoln College, a proud Laud shrewdly planning in St. John's College a pompous and powerful life. But fortunate above all are the Rhodes Scholars, men who can live in this quaintly modernized place and drink in long drafts of its custom, history, and knowledge for three long and yet fleeting years.

It is not to be expected that Oxford will be found an up-to-date rustling university like one of our own country. In Oxford is found a delightfully entangled congregation of colleges, governed by its graduates, hoary-headed sticklers for precedence. As each generation graduates, and, by reason of its Masters' degrees, becomes a part of the working machinery of its Alma Mater, it in turn becomes a set of hoary-headed sticklers for precedence. Thus changes come slowly—if at all. This is right; we would not see Oxford modern! It will be a day long mourned by all true Oxonians when from the Statute Book are erased the foolish but ancient rules; when that much-abused, short, loose gown with its two plaited straps dangling behind is abandoned; while to lose that venerable

embodiment of long ago, the antiquated don, who so patiently struggles to enlighten in the lore of Greece and Rome your non-classical mind, would be to lose Oxford itself. No. Oxford must remain as it is.

Today in most countries we find the leading universities more and more tending to confine and relegate the learning of the ancients to a school which is apart and distinct from all others; in many universities entrance requirements no longer include Latin and Greek; German, and French, and mathematics are taking their place. Not so in Oxford. She still sleeps. She still compels every member of her body to know his Plato and his Virgil. Last year some presuming moderns suggested the elimination of Greek as an entrance requirement to the university. Oh, vanity of vanities! Oh, presumption of presumptions! The loyal hoary-headed sticklers for precedence were not betrayed; Greek still exists as a study compulsory to admission.

Again, we find that most universities have developed strong technical courses and schools of applied sciences; that they have practicalized their systems of education to such a degree that they have infused new life into their nation, encouraged invention, and fostered independence of other peoples. Oxford has not developed these branches; she has reluctantly admitted them into her curriculum, but that is about all; she does not encourage them to an appreciable degree; she has not practicalized her education. All that Oxford teaches is by no means useful—in a practical sense; some few things she teaches for customs' sake only, other few because exigencies demand them; the majority she teaches merely for knowledge's sake. Oxford takes a youth fresh from the public school and plunges him into a chaotic mass of highly ideal knowledge; she turns him loose into this common-sense and prosaic world, if possible to practicalize the knowledge he has gained; if impossible, to acquire a new practical and necessary education. An Oxford graduate has still to fit himself for this real world of struggles and hard-gained prosperity. In short, Oxford does not fit her students for their life-work.

Is not this—knowledge solely for knowledge's sake, *then* knowledge for the sake of practicability—the opposite of the natural order of things? In the United States the universities reverse this. *There* practical knowledge first, *later* ideally conceived knowledge, is found. There a man is *first* fitted for his life-work, *then* turned loose to build upon the foundation he has laid a confineless structure of ideal knowledge; after a student has received a practical education, he is allowed to wander at will in the Elysian fields where knowledge for knowledge's sake quintessentializes every flower and blade of grass, every thought and every act.

I cannot, however, condemn the Oxford system. It has its advantages, and is obviously the proper one for that university. Consider what class of men go to Oxford, and for what they go there. Because of the enormous expense it is impossible for a poor man to attend Oxford. One part of the undergraduates there belongs to the aristocratic class, another to the wealthy class; a third part to the ambitious but financially limited class, which includes men who come to Oxford on scholarships and exhibitions, or on stinted incomes—the last usually for research work. Men of the two first classes do not have to think of making a living in future days, they are provided for; men of the last, if doing research work, it is to be presumed that they already have obtained a practical education; if on scholarships, it will be found, in most cases, that they have specialized on some one subject *already;* if on exhibitions, they have nothing to justify their being in Oxford except great and powerful ambitions. These facts granted, it is found that a truly practical education, is not demanded of Oxford; only part of one class requiring to be fitted for life-work. Demand creates existence; were there a sufficient demand for truly practical education in Oxford she would be compelled to install it.

Why then should Oxford emphasize science and technical knowledge? Let England establish universities of that sort in other places; for, of course, she must have such. Manchester, Leeds, Birmingham emphasize them; make those universities entirely of that sort if

necessary; but leave Oxford antiquated. If not to the advantage of England, it certainly is to the advantage of the world that this center of ancient learning remain active in its characteristic branches. But it may be argued that Oxford *does* fit men for the professions, and that all undergraduates there intend a profession. I can only grant that it lays a foundation for a profession such as can be obtained at no other place in the world. If, in his profession a man depends upon his Oxford training he depends upon a narrow education, and altho it may be valuable, it is not always useful, for Oxford teaches valuable but not always useful knowledge—useful from a practical point of view, I mean.

Oxford does not only neglect the scientific side of its resident student, it also neglects the literary. The English Literary School, while it is rich in the professors and lecturers it has, still possesses too few of them—think of there being fewer than six English lecturers in a university like Oxford! The work in English is not pushed. In the weekly essays which men have to write in most of the schools, the style of the writing, the choice of language, the balance of sentences, the sequence of thoughts, are almost entirely ignored; the *matter* is the all-important to an Oxford don; if the facts are there the language matters not. To this is due the fact that tho we find good, deep thought, and perhaps originality in the written production of an Oxonian, we scarcely ever fail to notice that the thoughts are not logically arranged or clothed in well-chosen language. Professor Firth has deplored the lack of literary training in the History School in these words:

"The literary side of the young Oxford Historian's training has been almost as defective as the scientific. . . . The school produces few historians and few genuine students in history."

But Oxford is experiencing a slight touch of modernism. Dr. Osler in the Medical School, Professor Walter Raleigh in the English School, Professor Firth in the History School, and others, seem to be trying to modernize and practicalize and extend the work in each; they desire to make it more useful and productive of worldly-able students. Then there are the Rhodes Scholars in Oxford. What influence they have or will have can only be surmised, but it is certain that they have and will have some decided influence. Again, the present generation in England seems more energetic and more inclined to take lessons from other nations. I believe that eventually the Oxford educational system will be modernized and modeled to suit the exigencies of the day, but I am certain that in no other way will Oxford change. Still it will be the sturdy conservative university ruling its decrees by the laws of the ancients, in the vicissitudes of time consulting past centuries.

Oxford University itself is one big conglomeration of paradoxes; its religious tone is paradoxical, its government is paradoxical, and its methods of education are topsy-turvy. And yet out of this incongruous mass come men able and eager to grasp the most difficult problems of the world, and lead a strong and glorious nation well in the van of civilization. The government is indeed queer, and, were it not for its antiquity, we should call it absurdly ludicrous; as it is there is much at which one feels inclined to smile. Here are twenty-one colleges and four or five halls, each entirely independent of the other and each virtually complete in itself in the "Schools" of the university. One college may be particularly strong in the classics, another in history, a third noted for its attention to science. One may be composed almost entirely of Welshmen, another of English "bloods," a third may contain a preponderance of Scotchmen. But most of the colleges are strong in all schools, and cosmopolitan in students.

The university has little or no power over these separate corporations; it prepares and sets examinations, looks after the performance of ceremonials, and runs the libraries and museums. But each college governs itself, how and as it pleases. On the university statute books now are absurd rules and red tape almost *ad infinitum,* numberless customs which *must* be regarded, even tho at the expense of much valuable time—and occasionally money—ceremonials to perform and traditions to be followed.

At the head of the university is a Chancellor, a nobleman, who is appointed for life; a fine figurehead. He visits the

New College Chapel, Oxford.

university once a year—twice or three times, perhaps, if he feels so disposed; at Oxford he dons his scarlet gown and presides at a meeting or two, dines with the Vice-Chancellor, then returns to his home. The Vice-Chancellor is appointed by him, but even this is done by custom, for the head of a college who ranks in seniority of service to it is appointed. The Vice-Chancellor has great, almost unlimited, powers over university and city, which, however, custom and tradition forbid him to exercise. The ruling of the university lies in certain councils and assemblies whose exact statuses are difficult of comprehension. But despite all this confusion and red tape and congregations of different assemblies, the government of the university runs along as smoothly as well-oiled machinery. It is a wonderful mystery how all the cogs and springs and bands are kept in repair and working in apparent harmony.

In the social life, too, there appears to be an incongruity; for it is *not* conducive to study and *is* conducive to much that prevents study. An Oxonian's day can well be divided into lecture periods, athletic hours, periods for social intercourse at luncheons, teas and coffees; the spare moments are filled with reading and study. But here, again, Oxford can be justified by reason of the class of men who make up her student body. One is not expected to work much during term times, he is to take lectures, attend to his tutorial hour—one a week—and to absorb the culture and the spirit of Oxford; during vacations he is expected to study diligently. This scheme is possible because of the fact that largely the leisured class attend Oxford; they have plenty of time in vacations to read widely and study much. Then, too, the average undergraduate brings to Oxford the learning which has been born in him down thru generations; he brings the culture which has been bred in his very bones; he brings the scholarly instinct which he has had time to cultivate by the unrestrained use of a many-volumed paternal library, and by association with scholarly men.

These things contribute to make up that so-much-talked-of spirit which men are told incessantly to absorb while in Oxford. This spirit is one of the great benefits to be derived from this old university. While it is not tangible or visible, nevertheless it is a living reality, and altho it cannot be named or described, yet it exists truly, and its potent force can be readily felt. It is a subtle influence which enthuses one and gives him that true love of knowledge which at once marks him as a scholar. It wears down rough positiveness, softens the severity of prejudiced criticism, cultures and refines thoughts — intellectual thoughts at least.

Another element productive of this spirit—it is generally to be observed—is the manliness of the Oxonian. Nowhere is this shown so well as on the athletic field; here the Englishman shows, in its best form, that which is the essence of manliness, love of justice to all, fair play. On the field are no wrangling or disputes with the referee; the Oxonian has chosen his referee, therefore he abides by the decisions of that official; when an unfair

decision is made there is no immediate uproar, nor is the referee howled at; the Oxonian simply comments quietly to the effect, perhaps, that the referee has misjudged or has made a mistake, then he goes ahead and plays the game. If beaten, he contents himself with the fact that he did his best and lost at a fair game. If he wins, he knows he has won fairly and in a gentlemanly way. He plays the game as hard as he can, but never stoops to "dirty work" in order to win; he has no desire to win at all costs; his object is to win by hard work and fair play, if he can; if he cannot, then he loses in fair play after a hard-fought struggle. He admits frankly when he has met his better; he does not try to excuse himself when beaten. Thus the Oxonian plays a clean and hard game and indulges in true sport.

Paradoxical as it may seem, I believe that the careless way of the Oxonian also contributes to that famous Oxford spirit. The Englishman knows how to live. He accomplishes what he can with comfort and without sacrifice of health; he does not slur over things in order merely to finish them. When he has so much work to do, he does it thoroly but at his convenience. The Oxonian takes time to read the papers and interest himself to some extent in politics; he takes time also for the reading of general literature; he will not sacrifice the pleasures of good-fellowship, he must have his pleasure times. But he is not wholly slack, he improves the moments he has left; for he has learned how to concentrate his mind at any time he desires. He never entirely tires out his patience, his mind, or his body; he exercises all, but never to excess. How this easy way of living conduces to encourage the Oxford spirit is in this wise: it stimulates the mind and body to healthy activity, never to feverish energy and sickening surfeit; it instils a *love* of knowledge which in later years produces accurate scholarship. However, the careless way also has its disadvantages; to a thoughtless youth it begets laziness and neglect of work, it makes of him a contented dolt or a worthless, quiet pedant. Further, this carelessness is liable to run into both smaller and greater faults, into inattention to manners, deterioration of thought and care of others, into vitiation of morals, disregard of religion, loss and abandonment of ambitions. Hence the saying that Oxford either makes or mars men.

In the purely educational way there are two conditions in Oxford which are eminently admirable, the tutorial system, and independence of work. The two are concatenated. The first is admirable because of the value of personal contact, association with an intellectual superior. Even an hour a week is invaluable; for the student is then not only shown his errors and shown why they are errors and what is right, but also he is forced to defend his own views or stand self-condemned of shallow or total lack of thought. Personal instruction cannot be too highly estimated. The tutor assigns work, the student is dependent upon himself to accomplish it. He is very independent, for he has few set books to

The Famous River Walk, St. Mary Magdalen College, Oxford.

study; his tutor guides him in his work and advises him; the tutor feels responsible for the class which the student under him obtains in the examinations, which are two or three years in the future to the Freshman. The tutor does not rebuke him for lack of work except in extreme cases. The student has no marks credited to him which mean either success or failure, he is responsible only to himself. This independence of work leads to originality of thought, to the formation of original theories and ideas concerning his work, to a knowledge of books and how to use them. This last, by the way, is extremely important in the United States, where the *essence* of knowledge is of greatest importance; where general facts are striven after to the neglect of details; where the ruling idea is to know a subject in the skeleton and know *where* readily to find the "fill out" and detail knowledge.

These then are a few of the impressions which I have received in more than a year's residence at Oxford. It is the duty and the privilege of every Rhodes Scholar, I believe, to observe and mark the best things in Oxford. A very few of these I have given here. The faults which are noticeable in Oxford should interest an American who is residing there in three ways: first, in so far as they are paralleled in his own country; second, in so far as they help to show up the good points; third, in so far as a full realization of them will urge him to try and insure avoidance of them in the United States. In the faults I have pointed out here I have kept in mind these three assertions. I have stated facts as I believe them to exist; I have spoken for myself only, and if anywhere I have referred to the Rhodes Scholars as a whole, I have not by that meant to assert their views, but simply my own. I do not wish it to be thought that I am representing any consensus of opinion.

There is current in America an idea among many, even of our educated men and women, that three years spent at Oxford are three years thrown away; that Oxford furnishes an education which is not only worthless but even deteriorates the American who acquires it; that it produces effeminate men and turns Americans into deplorable half-breeds. The only remark needful to be made upon this is, that such people have not been at Oxford and are unacquainted with Oxford education; are they in position to judge? There are other people who think that the Rhodes Scholars will return to America Anglicized and because of this will prove less staunch and valuable citizens of the United States. There is nothing less likely to occur. Mr. Rhodes' statement that the more the Rhodes Scholars see of other countries the better citizens of their own they will become is being proved true. Three years' residence at Oxford is invaluable, and fortunate is he who can obtain it. I cannot express my feelings upon the subject better than has already been done by one Rhodes Scholar: *I am glad to be at Oxford.*

OXFORD, ENGLAND.

The High School in Tyler

BY MRS. STELLA LANE

[Of course Tyler is not the real name of the town in a certain Middle Western State concerning which the following practically true story is told. We think it will be of interest to the fathers and mothers who live in other towns than Tyler.—EDITOR.]

BEFORE John had made his little venture in copper, and while we yet lived in the little cottage, my oldest daughter, Helen, was in the grades, and had never become popular. Indeed, many times, during those earlier days, I taxed my mind trying to think of soothing things to say which might heal her childish wounds and suppress the petty jealousies engendered, because the children of the "best families" frowned upon her socially and did not invite her to join any of the juvenile clubs.

At this time I was having similar ex-

periences in my own social relations with the parents of these children, and I could fully sympathize with my daughter's little heartaches and piques of pride.

About a year after we had built us a large house on one of the best streets in Tyler Helen entered the high school. Then it was that she suddenly leaped into popularity.

During the first few weeks after school opened she was much sought after by both "The Elites" and "The Dessert Club," the two best girls' clubs; also "rushed" by "The Swells" and "The Nobility," the two leading boys' clubs.

The members of these clubs devoted much time to electioneering and a subtle sort of diplomacy in competing for desirable new members among the few elect, while the great number of boys and girls were passed over unnoticed and unsolicited.

It seemed to me Helen was a little young for club life and the numerous social distractions which, I was told, necessarily accompanied it, so, after considerable deliberation, we decided that she should wait a year before joining any club.

Such a thing as a girl "turning down" both "The Elite" and "The Dessert" clubs, we were informed, had never before happened in Tyler. And during the succeeding few weeks our domestic tranquillity was greatly disturbed. Helen was forewarned that "the girls" would not merely be indifferent to her, but they would boycott her socially, and deliberately shut her out from "the best things going." Indeed, the child was so wrought up and alarmed about her future that I almost repented of this decision John and I had made.

About a month later, however, a member of "The Swells" boldly announced that he would accept a dictum from no girls' club, and invited Helen to the "autumn dance" given annually by his club.

For two weeks before the party was given the child was in a continuous flutter of excitement. The first party dress was being made. Several of "the girls," who had begun to soften somewhat toward Helen, and Dorothy Driggs—a niece of Mrs. Tweak, who was especially anxious to get her launched right socially—seemed to disagree with me upon many little points under consideration. The crucial difference was about "low neck" and "short sleeves." I was willing to compromise on short sleeves and a lace yoke, but remained steadfast against the "low neck," about which I learned "the girls" had said I was an old fogy.

At last the evening of the party arrived. Helen was superlatively happy; all the little bickering we had had seemed to have been amicably wiped out in her rapturous anticipation; even the lace yoke was now beautiful and satisfactory to her. The hours on the pretty engraved invitations read from eight to eleven, but by seven Helen was dressed and roseate. She went to the parlor and played all the dreamy pieces she knew until half past eight. By nine she looked frightened and slightly feverish, and I think she had begun to be fearful lest young Burdett would fail her at the last moment. At last, about a quarter past nine, a carriage drove up, and the young man, who was not nearly full grown, came slowly sauntering in, dressed in evening dress, pumps, white tie and gloves.

"Why, Rollie," said I, as Helen hurried into her wraps, "we had about concluded you were not coming."

"O, there is no hurry, Mrs. Lane," he replied, languidly, "for you know we do not want to go on time and appear like jays."

I glanced out of the window and saw the cab was waiting.

"Surely, Rollie," I protested, "you are not going to ride to the hall, only two blocks away, on this beautiful moonlight night."

"Certainly we are, Mrs. Lane. You know I belong to 'The Swells,' and we cannot afford to give 'The Nobles' a chance to laugh at us."

The party was a great success, Helen declared. She got home about one o'clock and assured me she had come away first and as soon as the refreshments had been served. The day following she told me her experiences in detail. As nearly as I could gather, every feature had been carried out with punctilious ceremony and precision, just like the grand parties in the full grown world.

"Who were the chaperons?" I chanced to inquire.

"That is one thing, mother," came the solemn reply, "about which both 'The Swells' and 'The Nobility' are absolute. They say they will not be tethered to governesses; they are well able to take care of themselves. Chaperons are all right in 'the East,' where boys and girls are unused to freedom from childhood, but out here, where they breathe free air and at an early age, think and decide for themselves, chaperons are superfluous."

The child waxed eloquent as she recited all this to me, and I saw she was deeply impressed with the high-sounding logic of her argument for freedom, and I was not inclined to raise a new issue just then.

At the opening of the following school year, after Mrs. Tweak had dilated on several occasions upon the many advantages accruing to a member of these high school clubs, she approached me very cautiously one morning about Helen. "The Dessert Club," she said, would be glad to have Helen join them, but they would never again suffer the humiliation of being turned down. The girls could not have forgiven last year's rebuff had she not explained that I was not a clubwoman myself, and could not be expected to understand the ethics of club life. This was at a point in my own social career when my pride was easily punctured, and this little thrust did not leave me unwounded. I would consult with John about the matter, I said, and thus the decision was somewhat belated, for neither John nor I could make each other see the value of all the advantages Mrs. Tweak had enumerated to me.

At last one evening, after I had broached the subject for the fourth time, hoping to force John to a decision, he poignantly remarked: "After all, Stella, I don't see but that Helen is hankering after the same thing you've been wanting for some time, so perhaps you had better let her join."

Some weeks later Helen came home one evening looking somewhat dejected.

"Mother," she complained, "Dorothy Driggs has given me to understand plainly that the girls of our club do not think I dress well enough for school; they think it is each girl's duty to look as well and stylish as possible, to keep up the reputation of her club."

"But, my child," I replied, greatly astonished, "your clothes are plain and well made, and certainly very suitable for school."

"That is just the point," she retorted; "they are too plain, and in no way distinguish me from the mass of girls who do not belong to clubs. Most of the girls wear their best things to school, and say they would rather appear plain or shabby at home or on Sundays than lower the standard at school; besides," she added, looking yet more dejected, "most of the girls have necklaces, bracelets or watches; some have diamond rings or sunbursts, or watches set in diamond chips and pearls, and I have only this shabby little ring."

"Very well," I said, hoping to comfort her, "I will visit the high school and see how the girls dress."

Several days later I made my visit. I arrived shortly before the bell for intermission rang, and immediately all the girls of "The Dessert Club" flocked about me to pay their court. Dorothy Driggs, dressed in a pretty brown checked silk, which I knew had just recently been made, first greeted me. Her coiffure was a very high and elaborate pompadour, with a sparsely covered "rat" peeping boldly out at one end. On her fingers were at least six rings and about her neck was a delicate necklace with a pendant set in pearls and a single solitaire—Mrs. Tweak's last Christmas gift. Next, several other girls whose clothes were less elaborate, but not unpretentious, greeted me, and finally Belva Lighthead, who was then the most popular and most envied girl in "The Dessert Club," came up.

In spite of the crisp autumn weather, Belva wore a gauzy white silk and lace waist, cut slightly low at the neck and with sleeves only to the elbow. Her skirt was an elaborate, creaking, black taffeta —the one, Helen told me later, which her mother had recently bought in Goshen for thirty dollars. At her neck was a large sunburst, and on the left side of her chest was suspended a small gold watch set in diamond chips and pearls. On her arm was a heavy link gold bracelet, with a medallion set in various stones on top. This was young Herbert Dasher's latest gift to Belva, Helen confided

to me when we got home. Herbert had locked the bracelet and now carried the key, so Belva could not take it off.

I could now readily understand why my daughter was unhappy about her clothes, for they were conspicuously plain among her present associates, and we compromised on her wearing her second best things generally and her nicest things on extra occasions.

One Saturday afternoon early in the following spring Helen had been invited to take a long ride into the country with Jack Stevens, Evelyn Quickly and Rollie Burdett.

About five o'clock I chanced to glance out of the front window, when I saw the little party had returned. Jack, sprawling on the end of his spinal column, his feet perched on the dashboard, smoking a huge, curved pipe, sat in the front of the surrey with Helen. In the rear sat Rollie huddled in a heap, occupying most of the seat, pompously blowing wreaths of cigaret smoke about Evelyn's face. The boys, in their present grotesque positions, looked even more undersized and diminutive than usual — in fact, I have noticed that the high school boys are mostly undersized when compared with the girls—while Helen and Evelyn looked large, well developed and radiant as they alighted.

At the earliest opportunity I remonstrated with my daughter for allowing the boys to smoke pipes or cigarets while walking or driving with her.

She was very positive in opposing my argument. Since the other girls did not object, she said, why should she pose as a reformer?

I concluded the little altercation by telling her to place the burden of the objection upon me, and to admit to the boys that I realized that I was fussy and old-fashioned, but objected to her walking in the street with a boy smoking.

A few days later she came in from school, her eyes twinkling, and I knew she had something, which to her seemed momentous, to tell.

She immediately began: "Jack Stephens walked part way home with me, mother. He started to light his pipe and I told him what you said."

"Was he offended?"

"Oh, no!" she continued, with a flavor of bravado, echoing Jack's manner. "He said: 'I'm afraid, Helen, your mother is a little passie (meaning *passé*) in this world. Tell her I happen to know that men at Oxford and Harvard smoke pipes with women on the streets, and if "guns" like that can do it, I guess there's no harm for "jays" like us doing it.'"

"Did Jack put his pipe away?" I asked calmly.

"Oh, certainly!"

"Well," I replied, firmly, "I still persist in being fussy and old-fashioned."

Early at the beginning of the following school year, "the Nobles" announced that they were going to vary the monotony of their usual dancing party by having a "hay-ride" into the country; an "old-settler" fiddler to play for the dance; and a farmer's supper before returning home.

"The Nobles" had hit upon a happy idea, I thought, for this kind of an entertainment impressed me as being infinitely more attractive for very young people than the conventional dancing party. So when Helen was invited I readily consented to her going.

"Who are the chaperons?" I asked, a few days after the invitation had been accepted, for it had not occurred to me that these young lords and ladies would object to escorts on an escapade of this kind.

"Oh, mother!" replied my daughter, seemingly alarmed, "I do hope you are not going to reopen this old issue of chaperons when you know how strongly most of the boys and girls feel about it. How I wish you were an active worker in the 'Foreign Missionary Society,' like Mrs. Aspire; then you would not have time to be so concerned about the customs at home!"

I did not press the matter further with the girl, for I knew she was powerless to change matters, but it occurred to me to appeal thru the telephone to Mrs. Aspire, who was socially obscure, but a tireless worker and extremely ambitious to launch her two pretty daughters on the highest plane of Tyler society.

"Both of your daughters are invited to the hay-ride party," I began.

"Yes, they are very fortunate," came the response.

"Do you know that 'The Nobles' have

made no provision for taking an older person with them, and the party is not likely to get back before midnight?"

"Well?" Mrs. Aspire inquired.

"Do you not think that if several of the most popular girls would stand out firmly for a chaperon, the boys could be persuaded to take some older person along?" I continued.

"I should hate awfully, Mrs. Lane," came a pungent reply, "to have as little confidence in my daughters as you seem to have in yours. If I had not absolute faith in my children I should not allow them to go at all."

"It is not for lack of faith in my daughter," I retorted, somewhat nettled, "that I am so solicitous in this matter, for I am sure she could be trusted as well as most of the girls and better than some of them; it is rather for the sake of the single one who might commit an indiscretion, and for the personal consolation I should have in knowing that an older person would be with them in case of accident."

"I am sorry to be obliged to tell you that I am with 'The Nobles' and 'The Swells' in this matter." And thus the dialogue was concluded.

I next made a very cautious appeal to several of the boys, with whom I was now on a very friendly footing. They consented to invite two young women who had recently been graduated from an Eastern college as "guests of honor," but it was to be distinctly understood that they were not chaperons.

I had now begun to experience some of the harassing trials with housemaids of which I had so frequently heard my friends tell. For several months I had been unable to procure any one who had had the most elementary training in cooking or housework. I had always insisted on the principle that each of my children have some little share in the household duties, but now I was compelled to increase my demands temporarily. Helen's time for recreation after school was limited to an hour; then she helped me prepare the dinner, and each Saturday morning she spent several hours with me in the kitchen cooking.

One evening she came in from school looking very doleful and began to murmur: "Mother, do you know I am about the only girl in my crowd who must do housework or cooking? The girls think it is an imposition that I must help in the kitchen when I am trying to keep up my music."

"It is a little hard for you just now, Helen," I replied, ruefully; "but I certainly hope we will soon be able to find a maid of some kind. But tell me who does all the work in 'the girls'' homes, for you know most of their mothers are often without maids?"

"Oh, their mothers do it. Mrs. Aspire, for instance, says she was the oldest of a large family, and had a hard time when she was a girl, but she means to have her daughters fitted for better things than housework. Most of the girls have never cooked at all and they say if they do not learn they will never have it to do."

"But if they should marry and have homes and families of their own?"

"Oh, but most of them say they will never have families and they are going to board when they marry."

"What do they expect to do in return for the men who must work to clothe and board them?" I inquired.

"I do not know," came a belated reply. "I have never heard them say.

At last a maid was found, one in whom was combined a good cook and housemaid, and happy was I to be relieved of some of my onerous burdens. Helen had been so faithful and cheerful in assisting me, after the one little protest, that I told her she might have a party as soon as we had recovered from the spring housecleaning.

The young people had a jolly evening, frolicking and dancing, and all my preconceived little prejudices against some of their ways of doing were felicitously wiped out by their spontaneous youthful merriment until about an hour before the time of disbanding. They seemed somewhat fatigued, when some one proposed that they have a little music.

Mary Sensesome was called upon and went timidly to the piano and began Weber's "Invitation to the Dance." She had hardly finished the pretty introduction when one boy called out, "None of that, Mary!" and another, "Nothing classic for this crowd, Mary!"

The girl slowly desisted, turned about, her face crimson: "I thought you all knew that I cannot play rag-time," she

said, as she left her seat. And no one asked her to continue playing, altho she is recognized as the best amateur musician in town.

Next, some one proposed that they all sing together. As chorus singing is always a pleasure to me, I ventured to take a seat in the rear of the room with the young folks, and the singing began. First there were a few insipid love songs, but gradually the music took on a little more vivid coloring and the young people more animation. Some walked about, acting pantomime, bowing, making eyes, leering, etc., as the words of the songs suggested. Perhaps a dozen songs were sung before I left the room, among which I can only recollect some of the titles and little snatches of the words, and Helen declares she cannot recall the words to them and I have made no effort to spur her memory.

"Won't You Come and Fondle Me," "Kiss Me, Kiss Me," "Coax Me" and "Making Eyes" were the titles which most impressed me. The chorus of the first song I easily retained:

"Won't you fondle me?
Put your arms about me in a loving way,
Tell me that you love me and you're going to stay,
I'll stop flirting, too, 'cause it's hurting you,
Tell you that my heart's a-burning for you,
If you'll only fondle me."

"Making Eyes" is the single song of which I have been able to get a verse intact:

"In a cozy corner with your beau
Lights are low—cheeks aglow—
You say—'want a squeeze?'
She says—'O, you tease,'
Just the same she doesn't answer—'No.'
Tell her she's the only girl you prize—
Just your size—she'll get wise
Play the little game all lovers seem to know by heart,
Making goo-goo eyes."

As the singing of "Making Eyes" was concluded, Jack Stevens remarked that that song always made him blush. Fearing lest I might further highten Jack's lonely blushes I left the room, and the young people soon departed for home in a supremely hilarious state of mind.

One afternoon toward the close of the spring term Helen came dashing in: "Oh, mother," she sputtered, "we have had a great commotion in school today. Rollie Burdett and Evelyn Quickly have sent out cards announcing their engagement, and last evening at the party (to which Helen had not been invited) they stood in line and received formal congratulations. Evelyn is only fifteen and Rollie seventeen, and they say their parents know nothing about their engagement yet."

The next evening just about dusk I heard a great noise and clatter in the front yard, and above the beating of drums, tin pans and ringing of bells, several voices called "Helen! Helen!"

They were going to "chivoree" Evelyn and Rollie on the strength of their engagement, and they wanted Helen to join them.

Helen came back a little dubious-looking to ask permission to go.

"Think," I said, "how badly poor Mrs. Quickly must feel to have Evelyn do such a thing, and this "chivoreeing" will only add to Mrs. Quickly's embarrassment," altho Mrs. Tweak had told me that she had asked Mrs. Quickly that morning if it were really true that Evelyn was engaged, and Mrs. Quickly had replied tartly that Evelyn had told her so and she had no reason to doubt the child's word.

To my surprise Helen did not urge for permission; went out and frankly announced that her mother did not wish her to go.

"Go, anyway!" vociferously called out Jack Stevens; "she's not your boss, is she?"

"If you mean my mother, Jack, I must confess she is," the girl retorted, boldly, "and probably will be for some time to come."

"Well," continued Jack, bumptiously, "it seems to me it is about time for you to emancipate yourself, as the rest of us have."

"I'm afraid my father would put forth a strong hand of interference if I should attempt that, Jack," she said, laughing.

I hurried away as the din recommenced and the young people marched up the street, not wishing Helen to know that I had overheard the dialog. There were no further comments, and I felt somewhat comforted, for I had some time since discovered that my daughter was no longer blindly dazzled with the glamor in the high school, and that she was slowly but surely acquiring a little real wisdom and common sense of her own.

Editorials

In response to a number of letters from subscribers of *The Search-Light* we wish to say that the last issue of *The Search-Light* appeared on May 26th, and the first issue of The Independent sent out to them was that of July 19th. During these seven weeks no paper was sent to their addresses. To make up for this lapse The Independent will grant an extension of seven weeks to all *Search-Light* subscribers who renew their subscriptions to The Independent on expiration.

A Great Fortune for Philanthropy

During the last ten or fifteen years many persons must have thought of Russell Sage's grand opportunities to serve his fellow-men and at the same time to perpetuate his name. He had no children. His blood relatives, whom he ignored, expected nothing from him. What was he to do with his fortune of $80,000,000? Apparently he did not permit his mind to be burdened with such a question. But there were so many things that he could have done with the money, or even with a quarter of it. He lived to be almost 90 years old. He might have passed the last ten years of his life in perfecting great projects of philanthropy.

Before his death he might have seen thousands of his needy or otherwise unfortunate fellow men enjoying the benefits of his efforts for their enlightenment or comfort. All this might have been if it had been possible for him so to use or distribute his great riches. Probably it was not possible. He had become a very effective machine for making money, but he did not desire to give or distribute what he gained, and we judge that he could not have enjoyed the process of distribution. In this he was unfortunate.

Mr. Sage knew his limitations. He did not build great educational or charitable institutions to which his name could be attached, and on account of which his memory would have been honored for generation after generation; but he left his money to one who, as he well knew, would use it for the good of mankind. This was proof of both his love and his respect for her who had so long been his companion. But it imposed upon her a heavy burden of responsibility and care. Mrs. Sage is 77 years old. It is well understood that she intends to devote the greater part of this fortune to charity, in the broadest sense of that word, and that this purpose was foreseen and approved by her husband.

Those who would attempt to predict to what institutions or in support of what forms of charity or philanthropy she will give from her great store should remember that the giver is a deeply religious woman, moved by the sufferings of the unfortunate poor, and familiar with the wants of certain charitable institutions and organizations to which she has given in the past. If the almoner of this bounty were Russell Sage himself, transformed into a large-hearted and far-seeing philanthropist, many projects would appeal to him which the world will not expect her to consider, altho even now she may have some of them in mind.

A Russell Sage so transformed might, for example, think of setting up an enduring and amply endowed institution for teaching American cities how to govern themselves intelligently and honestly, with due regard for the rights and welfare of all their inhabitants—an institution teaching constantly, by models and by precept, civic righteousness and cleanliness and health and comfort. Ten millions would be enough for that. He might plan and establish another, to deal scientifically and impartially with the relations of labor and capital, and with the needs of labor. Such a project might involve the construction and operation of model factories and the suggestion and promotion of just legislation.

The endowment of medical research still leaves much to be desired, despite the benefactions of Mr. Rockefeller and others. Such a Russell Sage as we have imagined would see how several of his millions could be very effectively employed for the public good in stimulating fruitful inquiry in this field. In promoting scientific research, also, especially

with respect to agriculture, a part of the money accumulated by his careful economy could be well used. A dozen institutes like Booker Washington's; fifty Sage professorships in as many colleges; a fund for the encouragement and reward of needy inventors—these are some of the things that might seem attractive to such a philanthropist. And he might endow the promising movement for peace among the nations of the world. A million or the income of it could be usefully expended in that way.

When we turn to the needs of the poor and the alleviation of their sufferings we see the field of philanthropic labor in which such a Russell Sage would surely expend the greater part of his millions, and in which, we are confident, his widow will clearly exhibit her broad philanthropy. With such a fortune, or even one-third of it, how much could be done to improve the housing of the poor! Mrs. Sage and her agents could build not merely model tenements, but many blocks of them, with all the advantages which freedom of treatment for full block areas permits. Mrs. Gilman has shown in THE INDEPENDENT the possibilities of such treatment. Examples of such blocks could be set up in the congested districts of a dozen cities, to teach others who are both rich and philanthropic, and to cause other similar manifestations of philanthropy.

It would be possible even to establish model settlements for the industrious poor in the suburbs of several great cities, and also to supply the means of transportation between the work and the homes of the settlers. The world needs endowed experiments for the development of such improvements as this. Hospitals for the sick poor? There might be such a Sage hospital in each one of a dozen cities. Homes for orphans, homes for the aged and destitute—there are not enough of these. And the poor should have halls for innocent amusement. Any one who has millions to be spent in assisting them and brightening their lives should learn in the University Settlements, as well as in hospitals and almshouses, the many ways in which their wealth can be used to the best advantage.

And there are associations, such as the Charity Organization Society, the Children's Aid Society and many others in New York and elsewhere, which are doing all they can, and which well deserve the benefactions of those who have millions, or only now and then a dollar, for the worthy who are in misery or need. All these the distributor of the Sage accumulations will not overlook, for some of them have already been her beneficiaries. Nor will she pass by the religious societies, for to them she has been a helpful and sympathetic friend. Colleges, schools and museums may and should be remembered by her, but the world will look to Mrs. Sage for direct and practical aid for the deserving poor, rather than for the enlargement of public collections of art. That is good work, and it will be done by others.

If the possessors of great wealth are to be envied, it is chiefly because of their power to give to those who need. This giving should be the cause of rare enjoyment. The rich who do not seek such enjoyment miss their finest opportunities. The world is told by Mrs. Sage's intimate friends that in the closing years of her good life she is to experience the profound satisfaction and pleasure arising from a philanthropic distribution of her husband's great fortune, with the consciousness that he in his grave approves. She is, indeed, to be envied.

Imitating Their Elders

THE story of high school life in Tyler that we publish on another page is interesting for several reasons. Its essential genuineness is evidenced by its very crudity, intensity and lack of perspective. It is no abstract sociological study, but is manifestly written by one in the thick of the fight. And, of course, the evils it describes are very real and deserving of more attention than the Philippine question. About the high-school fraternities, juvenile snobbery, precocious society, overdressing, disinclination for housework, vulgar songs, and the rest of it, there is no difference of opinion among sensible people. Whether we laugh at them or frown, we all agree they ought to be done away with.

But how to do it is a more difficult matter, on account of that very disagreeable propensity of young people to follow

the example instead of the precepts of their elders. Children do look so funny when they dress up and prance around in the clothes of their parents. When we contemplate the spectacle presented by the young people of Tyler, our amusement (or our indignation) is evidently not caused so much by the inherent absurdity (or wickedness) of what they do as by the manifest incongruity of their ages and their actions, and by the reflection it casts on the doings of their elders. It is not safe for any except model parents to sit at the open window while their children "play papa and mama" on the grass outside. The tones of papa's cross remarks and mama's nagging are often too accurately imitated. Children differ from their elders not so much in their feelings, but in their frankness in exposing them. They let the cotton stick out of their dolls in a way that offends our delicacy. They have not learned the art of decently concealing their motives from each other and from themselves. Their clumsiness in hypocrisy is shocking to us. Perhaps, were we wiser, we would rather lament their growing skill in it.

Every father thinks his son learns to smoke too young. A mother, who married at 17, finds it ridiculous that her daughter falls in love at 19. In both cases, very likely, the father and mother are right, but it is not surprising that their children do not see it in the same light.

Of course, it is absurd in a high-school girl to wear diamonds. But, then, it is absurd in anybody to wear diamonds. Last year we, the people of these United States, spent $35,000,000 for diamonds. This sum of money, which would have raised a hundred thousand families from poverty to comfort, might just as well have been thrown into the sea. We do not say this out of envy of the wearers of diamonds, nor from a desire to have them divided communistically among all the people. The 50-cent diamond which would in that case have fallen to us would not materially improve our personal appearance. Nor do we argue that $1,000 or $10,000 is too much to pay for a pretty, polychromatic sparkle. That is a question of taste. But a synthetic stone having exactly as pretty a sparkle —undistinguishable from it, in fact— could be purchased for a few dollars; therefore those who contributed their millions last year to the estate of the late Mr. Beit did so purely for the purpose of showing to the world that they could afford to give Mr. Beit money without receiving any value in return. It was the custom in their set thus lavishly to bestow alms on the richest man in England, and they had to do it.

Now Rollie Burdett when he hired a cab to go two blocks was acting from exactly the same motive as the diamond wearers and as all the rest of us when we indulge in any ostentatious superfluity. We are as good as anybody, and if we are not as wealthy we will pretend to be and that will do just as well. So the society of the village apes that of the town, and the town apes the city. The aristocracy of America imitates the aristocracy of Europe, and the latter for want of contemporary models of higher rank imitates its ancestry. Nobody thinks that the customs of fashionable society are pretty or convenient or sensible, but they are expensive, and that is a sufficient reason why they are imitated all the way down the ladder of snobbery.

But to lead the society life properly requires $10,000 a year and freedom from other duties. Therefore for all lower stages there are incongruities and inconveniences. The conflict of standards is the cause of embarrassments and misunderstandings, and the transition stage is full of difficulties. Who ever heard of a chaperon on a straw-ride? ("Hay-ride," did she say? Never, good clean straw and enough to fill the rigging.) The young people were unquestionably right in their etiquet on this occasion. Old and young go together in the straw-ride to the barn-dance and there is no chaperon.

The imposition of the chaperon on the young people of America is felt as an imputation on their honor, and rightfully resented. But their opposition is foolish, because it is vain. Chaperonage is an essential part of the system they are so eager to imitate. In fact, our observation of small towns in this stage of evolution is that the young people themselves adopt the chaperon long before they need her or even know what to do with her. They

take on chaperons as they do visiting cards, evening dress and cabs, not because they have any use for them, but because they have heard that such are the customs of fashionable society. First one party in the town will have a darky waiter to call out the guests as they arrive, a superfluous proceeding, since they all know each other, but very "tony." Then the rival set has to beat this, so at their next party they boast of having a real live chaperon. The next step is to act so as to justify the chaperon, and French manners bring French morals. Every luxury soon becomes a necessity; it creates its own need, and it is so with the chaperon.

The hardest thing in the training of young people is to keep them from behaving like their parents, or, rather, like the social set their parents aspire to enter. And to reform all the old people for the sake of the children is too much to expect. But Helen seems to be a good girl at heart, and if she does not inherit her mother's snobbish tastes and her father's speculative tendency she may come out all right yet, and having married some nice young man from another town she will settle down and in time worry over her own ugly duckling and its unfavorable environment.

Old Home Week

Old Home Week was a discovery of Governor Rollins, of New Hampshire. It was born of a feeling of loneliness. He tells us that he had traveled extensively over New England, everywhere observing decay in the agricultural sections. How will it do, thought he, to invite the old people back again—those that have run away in despair and left things down at the heels? Then Old Home Week was born—a week when there should be a consultation of friends, old and new, and plans laid for the resurrection of New England prosperity. In the spring of 1899 he invited a conference to be held at Concord, and this ended in a State association to carry out his ideas and plans. Very shortly more than fifty local societies were organized, to co-operate with the Central. Then came the proclamation, in the form of an invitation from the State of New Hampshire, to every one that had ever lived in its borders, to come back again for a little while and assist in kindling the fires of State patriotism. The result was more than satisfactory. Old Home Week appealed to the hearts of long absent and scattered friends, who had found that visiting the old home alone was becoming less and less satisfactory. Every village gathered back from one hundred to five hundred, who enjoyed themselves with addresses, poems, marches and songs. Poor people came back as town guests, and were made as happy as the collective zeal of the people could make them. Richer sons and daughters came back to endow libraries and start a great movement in the direction of village improvement. Old homesteads and deserted farms were bought up and made into summer homes.

The movement spread with great rapidity. New Hampshire celebrated in 1899 in over fifty townships. In 1900 this number was doubled, and again in 1901. It was evident that a great festival was established, with a perennial sentiment at the heart of it. As Governor Rollins said, Old Home Week "appealed to the best and highest sentiments of our people." It brought together the West and the East. It carried away as much good as it brought. It reunited families, and it knit together the people of the whole country. Maine adopted the idea in 1901. Vermont and Massachusetts soon followed, with a strong wave in Connecticut and Rhode Island. In 1902 Old Home Week had kindled a blaze in Central New York. We believe that its celebration was at that time confined to Oneida County, but other counties were engaged in preliminary arrangements. The program for Oneida townships was rich and varied. Bonfires were kindled on the hilltops of Saturday night. The next Sunday services appropriate were held in Catholic churches as well as Protestant. From Monday onward every day was devoted to some specific town. Literary exercises were of the highest order, showing how much of intellectual power has been at command of that section where Hamilton College is nourished. It was peculiarly a democratic celebration everywhere, without an aristocratic touch. The day belonged to the common folk—to the people, in the good old New England sense of that word. It was also on a high key intel-

lectually, from beginning to end. It brought together old friends and townsmen; but, better than that, it brought the town together.

This unique memorial, not always Old Home Week, but sometimes Old Home Day, has not only spread over New York State, but into Ohio and Kentucky, and in modified forms is gathering the children of Missouri, Michigan, Wisconsin, and we believe even of Colorado. It has become a bright feature of that season of the year which has been devoted to summer vacations. It comes in just before, or, in some States, just after harvest, when social feeling has time for expression. A woman writing from the West responded to a New York invitation, "I would give all that I now have to sit down by the old glen brook, and paddle my hands in the water, and hear it talk." "I am going," wrote another, "but can you guess what it is for? Mostly that I may sit down under the big beech tree, on that flat stone—just to get a feeling of girlhood." An old man leaning on a staff, was found looking around in the corner of a hill orchard. He said, "I want to see the old leaning tree, that eighty years ago I walked up barefooted. I am lonesome for that tree. The new is not the old; but the old is all new. I must be made over again by death." Old Home Week brought these stragglers together, and made them feel that, after all, the world was still their place. Governor Rollins tells us of one case, where a brother who had gone to the shores of the Pacific as a "Forty-Niner" came back as a "Ninety-Niner," never to go away again from the peaceful fireside on the silvery sands of the Atlantic.

It does much good to those who have breathed the strenuous life of the West once more to inhale the atmosphere of the more quiet period in which our fathers lived. The private and family life of that time was Arcadian in its simplicity. No one needs to talk of a return to the soil, for he had never left it. He lived upon the produce of his own acres; was warmed by fuel cut from his own woods; and was clothed from the flax of his own field and the fleeces of his own flock. The great feature of household life was the huge fireplace, large enough to receive logs a foot in diameter, with an oven at the back and a flue large enough for a chimney-sweep. Around the great fire the gathered family spent their evenings. As Whittier sings:

> "We pile with care our nightly stack
> Of wood against the chimney back;
> The oaken log, green, huge and thick,
> And on its top the stout back-stick—
> The knotty fore-stick laid apart,
> And filled between, with curious art
> Of ragged brush; then hovering near,
> We watch the first red blaze appear."

But the object of Old Home Week was not only to refresh wanderers and give them a renewed taste for simplicity; it was equally to stimulate the home people to higher ideals and to broader sympathies.

Seeing everywhere abandoned farms and country churches, Old Home Week is working a decided revolution. Of course the old will not be restored as it was in the time of the fathers; but a new era has been inaugurated, with new ideals. Annual lists of abandoned farms are no longer published. Instead of a decaying religion, dying of inanition, church services are held in union schoolhouses. New England is living face to face with modern thought and modern science. Her wheat fields average more per acre than those of Minnesota and Oklahoma. Of course, the Old Home Week of Michigan and of Kentucky are not quite the same as that of New England; but they do bring together old friends and renew ties; they soften business life and teach that the social side is, after all, the more important. A big-hearted family day for such a widely scattered people as the American was needed; a democratic gathering of the old and the young, the old style and new styles. We can see that it is destined to be a national day, covering all the States, trumpeting together all the people, warming all firesides, and welding nationality as well as Statehood. Everywhere it will have a flavor of patriotism—wholesome, gentle and homeful.

The Supreme Court's Divorce Decision

The decision of the United States Supreme Court in the Haddock case as to divorces secured away from the former marriage home will cause great anxiety

and trouble thruout the land, as lawyers generally become acquainted with the decision and begin to invoke its application.

The decision is that the marriage relation is a contract or valuable something which has an existence and location of its own—like a piece of real estate, for instance—separate and apart from the existence and location of the persons who may be said to be interested in or to own the marriage. The location or residence of the thing, the marriage, is the place where the couple were married, or, if they have since moved, the place where they last lived together as husband and wife. The changing one's residence from one State to another of one of the persons married does not carry with it or change the place of residence of the marriage. That remains where the couple last lived together. The residence of the marriage may be in Ohio, and the residence of one of the owners, as it were, of the marriage, in Dakota.

The Supreme Court holds that the valuable thing, the marriage, must be attacked and dissolved at its home seat or residence—Ohio, for instance, if that is the place where the parties last lived together—if the divorce granted is to be held good in all States. The courts of Ohio, where the marriage has its residence, have jurisdiction over the marriage by reason of its being located within such State's borders, and can dissolve the marriage or do what they please with it, the same as they can settle questions as to a piece of real estate situate within the State's borders. Notice of the lawsuit can be given to the defendant by the sheriff's serving legal papers upon the defendant personally within the State, or notice can be given by publishing an advertisement of the lawsuit in a newspaper. Either way will do as well and make no difference as to the power of the Ohio courts to handle and dispose of the thing, the marriage, found within the borders of their State. All States would be bound to recognize the action of the Ohio courts concerning things within that State as legal and binding, no matter how notice of the suit was given. A divorce granted in Ohio would be good everywhere.

But if the marriage is attacked by suit in a State which is not the marriage home or residence—Dakota, for instance—but which is merely the residence of one of the owners of the marriage, a service of notice on the defendant personally must be secured within Dakota, or the divorce will be of no value outside of Dakota. Notice by publication in the newspapers will not suffice. The defendant must be caught there personally and served, to make the divorce good everywhere.

Every State makes its own laws and runs its own affairs. If Dakota sees fit to grant divorces to its residents on published notices, when the marriage itself is resident and has its home in some other State and Dakota has no jurisdiction over it, or over the person of the defendant thru personal service, it is Dakota's privilege to do so. Such divorces are good in Dakota, but no other State is bound to recognize them or give them any force or effect.

The result of the decision is that it is only inviting trouble to go away from the marriage residence in Ohio to get a divorce, unless in the State of Dakota, to which one goes, personal service can be there secured upon the defendant. If that can be done all is well, but if it cannot, and still a divorce is obtained, such divorce is limited and of effect in Dakota only. A person so divorced cannot remarry outside of Dakota. It would be committing bigamy in such other place. If such person does remarry in Dakota, he has two lawful spouses—one in Dakota, there recognized as such, but nowhere else, and one for all places outside of Dakota. Children by the Dakota marriage are legitimate in Dakota, but illegitimate elsewhere. Property situate in Dakota descends to the Dakota wife and children, but property outside of Dakota descends to the first wife and children. Persons holding conveyances of such outside property, signed by the Dakota wife, have defective titles and must get the first wife's signature to make them good.

This is not all the trouble. The innocent party in the first marriage—the woman, for instance—who remained in Ohio and, learning of the Dakota divorce, afterward remarried, has committed bigamy. Her second marriage is void and she has no interest in and cannot inherit her second husband's property. The children of the second marriage are illegiti-

mate and cannot inherit their father's property. If he should die without a will his property would all go to his relatives. His wife and children would be penniless and without remedy.

It is manifest that, under the decision, the stay-at-homes can get a divorce good everywhere, but the runaways get a divorce good only in the State where obtained, unless personal service has been secured upon the defendant in such State.

Ex-Congressman Fleming, of Georgia

THERE is hardly a man more honored in Georgia than the Hon. William Henry Fleming, of Augusta, Ga. He served six years in Congress, has been Speaker of the Georgia Legislature and President of the State Bar Association. No man's voice can properly command more respect in his State.

Mr. Fleming gave the address before the Alumni Association of the State University at Athens at its late Commencement, and his address is printed and is one of the most notable of the numerous Commencement addresses. He discussed "Slavery and the Race Problem in the South, with special reference to the State of Georgia." We would commend it to all who are willing to be interested in what is really the most difficult and tremendous question and problem before our country, as it involves both the social question of labor and the political and moral question of human rights.

One month before Abraham Lincoln was inaugurated as President in 1861 Alexander Stephens, one of the ablest and best men in the Confederacy, and, later, one of the best reconstructed, in a famous speech said that the cornerstone of the Confederacy was laid on the principle that the natural place of the negro is in subordination to the white man. He said:

"Upon this our social fabric is firmly planted, and I cannot permit myself to doubt the ultimate success of the full recognition of this principle thruout the civilized and enlightened world."

And yet scarce two years later slavery was abolished in the United States, and Brazil, the only other Christian slaveholding country, abolished the institution a few years later.

Mr. Fleming accepts, as nearly all Southern white writers do, the assumption of negro racial inferiority, but he sees the flaw in Mr. Stephens's argument, for that would give superior white men the right to enslave inferior whites. He says that the fear of negro domination is utterly baseless, and then he proceeds to ask for a policy of absolute justice for all races in law and its administration. He would not have the ballot taken from the negro, for without the ballot

"No inferior race could long protect itself against reduction to slavery in many of its substantial forms—and God knows the South wants no more of that curse."

Mr. Fleming believes in the educational qualification for the suffrage, but he wants it administered with absolute impartiality. The "grandfather clause" was an attempt to nullify the educational test, by admitting white illiterates while shutting out the black. It is, he declares, unconstitutional. He refers to the Gubernatorial campaign in Georgia, where both Clark Howell and Hoke Smith are pledged to shut out the negro in some way from the ballot, the latter by an educational qualification or understanding clause. He says:

"The scheme must be to disfranchise the negro by a fraudulent administration of the law. . . . Of course, the officers of registration are to be white. An easy paragraph for the white applicant; a difficult paragraph for the negro applicant; the acceptance of any sort of an explanation from a white applicant; the rejection of any sort of an explanation from a negro applicant—there you have the hidden cards with which the game of cheat is to be played. And it is on this miserable barefaced scheme of fraud that our proud and noble people are asked to rest their safety and their civilization."

So he would give the negro justice and equal political rights. He would not have laws enacted to limit the education of the negro in the public schools.

"We must judge each individual according to his own qualifications, and not according to the lower average characteristics of his race. Political rights cannot justly be withheld from those American citizens of an inferior or backward race, who raise themselves up to a standard of citizenship which the superior race applies to its own members. . . . We cannot afford to sacrifice our ideas of justice, of law,

and of religion for the purpose of preventing the negro from elevating himself. If we wish to prevent the wide gap between our race and his in the onward progress of civilization, let us do it by lifting ourselves up, not by holding him down."

This address was made to scholars and gentlemen. We believe it represents the sentiment of the better people of Georgia and the South. We believe it will prevail. There are those who tell us we do not understand the South or the negro. We will stand with Mr. Fleming, who does understand them. We do not stand with the noisy demagogs in Georgia who are abusing each other, and who agree only in seeking the best way to exclude and degrade the negro. It is because we believe that such men as Mr. Fleming will grow in numbers, while the Howells and Smiths will lose their hold on an intelligent and moral people, that we have no fear of a coming race conflict in the South. The era of equal justice will come, and it will be just such a blessing to the South as was the abolition of slavery.

The Calhoun Report on Venezuela

Many newspapers have called for Judge Calhoun's report on the situation in Venezuela. So far as we are able to learn the report has never been written, altho Judge Calhoun has had almost a year for collecting his thoughts since his return from Venezuela. It seems very doubtful whether he will or could make a report. He could not suggest arbitration, for a complete plan for arbitration was submitted to President Castro and to President Roosevelt and Mr. Hay and approved by them all, but was at once defeated by Mr. Loomis's cablegram confining arbitration to simply the obnoxious asphalt case. Then, again, Judge Calhoun could not suggest that we take aggressive steps against Venezuela, for Mr. Hay's so-called ultimatum distinctly covered that ground. All that Judge Calhoun could possibly do, therefore, is to continue indefinitely to prepare his report until the tide in Venezuelan affairs turns in some manner that will permit him to make a new suggestion, or he might possibly explain why, after the Hay ultimatum was sent, President Castro's agent in Washington was informed that in case it was not accepted no further steps would be taken by the United States to make the ultimatum effective.

Both Sides

Monday of this week Henry Clews, the well-known New York banker, posted this bulletin in his office:

AMERICA'S GREATNESS.

"Corn crop this year, 2,700,000,000 bushels. Wheat crop, 722,000,000 bushels. Cotton crop, 11,000,000 bales. United States Steel Corporation's net profit for the last quarter, $40,000,000. A man died today in Anconia, Ill., who weighed 460 pounds, and was 73 inches around the waist. This should not be surprising, because he was born in the corn belt country. A dark lady in Texas recently gave birth to six little blackies. What a country! What a people!"

It may be interesting to add: One person in every eight in the United States is underfed, underclothed and underhoused. The average income of the average family is not far from $600 a year. An unskilled laborer earns less than $460 a year in the North and less than $300 in the South. One per cent. of the families of the country possess more wealth than the remaining ninety-nine per cent. Over 1,700,000 children under fifteen years of age are toiling in fields, factories, mines and workshops. In the year 1900 there were 6,468,964 workers in gainful occupations unemployed for from one to three months. Every year 60,000 persons are killed by accidents incident to their work and 1,600,000 are seriously injured. Two-thirds of the population of New York are forced to live in tenements, in which there are 350,000 dark interior rooms. Last week a woman was found starving in Madison Square. A thousand ladies of New York are devoting themselves to the raising of pet dogs instead of children. What a country! What a people!

A Ghoul-Proof Grave

A rich man's danger from burglars does not cease with his death. The body of A. T. Stewart was stolen from his grave in St. Mark's Churchyard in 1878 and held for a ransom of $200,000, and in order to prevent a similar depredation now the coffin of Russell Sage was buried in a steel casket weighing three tons. Once closed it can never be opened, except by blowing it to pieces with dyna-

mite, for it is constructed like a burglar-proof safe, with the time lock set for eternity. It does not seem to have occurred to Mr. Sage that by being cremated he could have secured still greater safety from ghouls and at much less expense. But the $22,000 that the steel grave cost is less in proportion to the estate of $80,000,000 left by Russell Sage than the $100 spent by many a poor family on unnecessary and pretentious display at funerals. The late Governor Hogg of Texas showed a much more sensible and poetic conception of mortality when he requested that instead of covering his remains with a monument a pecan tree be planted at his head and a walnut at his feet. The National Nut-Growers' Association have undertaken the task of selecting the most fruitful and beautiful trees to be found for this purpose, and a state association has been formed to distribute the nuts from the two trees, and plant them in the barren places and treeless plains of the Lone Star State. Each of these trees will in turn spread its seed in its vicinity, so generations of men will have cause to bless the kindly thought of Governor Hogg.

The Rule of the Road

The Lord Chancellor in the English Court of Appeal, in deciding a recent damage suit, gave an opinion on road rights that is worth quoting. A motorist had run down and killed a cyclist, and a jury had condemned him to pay $7,500 damages to the widow of the deceased. The motorist appealed on the ground of contributory negligence, claiming that the cyclist paid no attention to the hooting of the horn and appeared to be deaf. The Chancellor, in dismissing the appeal, said:

"I desire to say this, that when people are driving motor cars or other vehicles on a public highway they have a duty to remember that deaf persons, and blind persons, and nervous persons, and children, and decrepit old persons are just as much entitled to use the public highway as they are. And if anybody thinks proper so to drive that there is a chance of serious consequences from a mistake of judgment or a miscalculation on the part of the driver, and those consequences are not averted, he will have to pay for it in damages."

The tendency in this country is also to deny the use of the streets and roads to any except persons who are able-bodied, agile and endowed with an emergency mind. In some of our country districts women and children have been practically confined to the farm during the summer season by the carelessness of motorists.

Belgium's Lesson to France

While King Leopold hesitates and delays to make adequate reforms in the Kongo Free State, France has looked on and finds that it is time to set her colonial house in order, if Belgium will not. So M. Deschanel, President of the Parliamentary Committee for Foreign Affairs and the Colonies, in assuming that position made an important address in which he evidently looked aside at Leopold when he said what France ought to do in her portion of the Kongo. She ought, he said, to exercise more control over the concessionary companies, in order to see that the conditions were strictly observed, particularly as far as concerned the reconstitution of the india rubber reserves, and to provide for certain failures in the protection of native labor, the shortening of engagements, the prohibition of barbarous punishments and the development of currency by paying salaries no longer in goods, but in cash, which would render possible the levying of taxes in coin. Everything must be done to suppress the carriage of loads on the head, which was an odious form of labor resembling a remnant of slavery. Hygienic and medical assistance must also be provided for. A humane policy toward the natives was the only one worthy of the civilizing *rôle* of France. So France would set her own house in order, before the world takes notice, as it has in the case of the Kongo Free State.

Sir Robert Hart

Among the problems of colonial administration now being discussed are, what is the proper length of tenure of office, and at what age should the civil servant be retired? If we may judge from the most conspicuous example of the British foreign service, we should say, 52 years for tenure of office and 71 for age of retirement. Sir Robert Hart entered the

Chinese Customs Service when he was nineteen years old, and he is now about to retire, not on account of an age limit, but because the Chinese are determined to get control of their own finances, in order to pay for their new army. Few men have ever been placed in positions of greater responsibility and delicacy than Sir Robert. Political corruption in Chinese officials was universal and traditional. Piracy had existed from time immemorial, and smuggling was a recognized institution. The Chinese hated the foreign officer thus placed over them, and the foreign Powers were jealous of his influence. Yet he administered his duties for a half century with such efficiency and tact as to secure the respect and admiration of his enemies. The Chinese Government decorated him with the Red Button, the Double Dragon and the Peacock Feather, and by a form of *ex post facto* law peculiarly Chinese, ennobled his ancestors for three generations back. He suppressed piracy and smuggling, mapped and lighted the coast and established a postal system. He controlled a large fleet of swift vessels and organized an efficient civil service force of 5,000 men, of whom 900 were foreigners. The lesson we can draw from this example is that if we want competent administrators for our colonial affairs we must catch them young, pay them well, give them a great deal to do and keep them at it as long as possible.

Censorship of Private Correspondence

What are we to think of this as an example of impertinent ecclesiastical tyranny? It will be remembered that Father Tyrrell, the famous English Jesuit and author, has lately left the Jesuits, and we have observed since then the movement in the official press to discredit his books, which were before lauded. Now Cardinal Ferrata, as Prefect of the Congregation of Bishops and Regulars, will not allow a bishop to receive him, except on condition that for the future he consents to subject his epistolary correspondence to ecclesiastical censorship! It is incredible, but true, seeing that up to date he has no writings on the Index; that he has neither been accused, tried nor condemned by any ecclesiastical tribunal. It is obvious that his sole crime is that he has left the Society, whose interest it is that he should be either absolutely silenced or else permanently discredited. The trouble is that Father Tyrrell is too much of a follower of Cardinal Newman to please those in authority. M. Bremond's new work on Newman has almost at the same moment been crowned by the French Academy and denounced to the Index. But they will hardly dare to condemn Newman by name, but will, very likely, condemn every presentment of Newman's which makes him a Liberal in any remote sense. The Vatican under Pius X is reverting to the attitude of Pius IX, as against that of Leo XIII; and reaction seems to be as dangerous ecclesiastically as it is politically in Russia. There is serious discontent in England, France, Austria, Italy and the Philippines. In America there is peace.

A curious incident at Raleigh, N. C., the other day illustrates the absurdity of nonsense. In the Supreme Court in that city there are kept two Bibles, one on which to swear white witnesses and the other to swear negroes. A scholarly gentleman, a professor of law in Shaw University, was on the witness stand, and the Sheriff gave him the Jim Crow Bible to kiss, whereupon the Judge sharply reprimanded the officer for giving it to a white man; so the other Bible was given him and he kissed it. Now is that Bible profaned, for it turns out that the professor is really a negro, tho to all visible appearances as white as any other man?

The Aëro Club of France has enough faith in the flying-machine of the future to christen it in advance. Altho no airships without balloon support are yet in use, the club has got a name ready for them when they do come. They are to be called "aëronefs." If the aëronef is propelled by a screw it is a "helicopter." If it is supported by plane surfaces it is an "aëroplane." If it flaps its wings like a bird it belongs to the "orthoptera," the same as grasshoppers. The man who runs a flying-machine heavier than air is not to be called a crank, as he is now, but an "aviator." The balloonist alone is an "aëronaut."

Financial

Recent Bond Issues

Bonds, or corporate stock, of the city of New York, to the amount of $12,500,000, all bearing 4 per cent. and nearly all to run for thirty years, were offered last week with disappointing results. Bids were few and low, the average falling below 101. The awards covered only $11,029,000 of the issue, and the average realized was 100.97, giving an income basis of about 3.94. Harvey Fisk & Sons get $5,000,000; William Salomon & Co., $2,500,000; the National City Bank, $1,000,000; and the Bankers' Trust Company, $702,000. An issue of $20,000,000 was sold in February last at 108½. There are several reasons for the decline. Owing to great activity in business and heavy speculation in real estate, money is in demand at higher rates; the market for New York bonds has been over-supplied; savings banks do not bid, because depositors are withdrawing for real estate purchases; large amounts of capital are tied up in underwritten but undigested securities; the city's expenditures are rapidly growing and costly projects are in sight. Comparison should not be made with the Government's recent sale of Panama 2 per cents. at 104, for the market in that case was an artificial one, because of the special terms offered to the bidding banks.

Samuel Byerley, to whom $5,819,580 of the Panama issue was awarded, has disposed of his bid thru J. S. Bache & Co. to Fisk & Robinson, who had already obtained half the issue by their own bids. Mr. Byerley's profit, upon an investment of considerable time and study and one postage stamp, is somewhere between $10,000 and $20,000. The express company which employed him as a clerk has rewarded him with promotion and a vacation, which he will spend in Europe. No deposit of cash was required with bids for these bonds, because Secretary Shaw desired to avoid a withdrawal of money from business channels. Altho the Government reserves the right to redeem these Panama bonds in ten years, it is generally believed that it will not use this right, and that they will run for thirty years, their full term.

*

....The acceptance of the resignation of Oscar S. Straus from the board of directors of the New York Life Insurance Company, which was offered on May 9 last, has been announced. Eulogistic resolutions covering the services of Mr. Straus were adopted at the adjourned board session of the regular July meeting, when the resignation was accepted. James H. Eckels, president of the Commercial National Bank of Chicago, and ex-Comptroller of the Treasury, has been selected as a trustee to succeed Norman B. Ream, and Julius Fleischmann has been chosen to succeed William B. Hornblower. Seth M. Milliken has been nominated as a trustee to succeed James A. Blair, and John Reid to succeed Mr. Straus. The New York Life has decided to apply to the French Government for the registration of the company in France under the new law applying to foreign insurance companies.

....Surveyors employed by James J. Hill are running lines north and south of Lake Winnipeg for a canal from Lake Superior to Hudson Bay.

....The Empire State Surety Company, of which William M. Tomlins, Jr., is president, and which transacts all forms of casualty insurance, has issued a statement showing capital of $750,000, net surplus of $127,202, and total assets of $1,457,434.

....Dividends and coupons announced:

New Orleans, Grt. No. R. R (1st mort. 5s), coupons payable August 1st.

Am. Chicle Co. (Common), monthly, 1 per cent., payable August 20th.

United Bank Note Corp. (Common), 1 per cent., payable August 15th.

N. Y. Cent. R. R. (R. W. & O. Div.), 1¼ per cent., payable August 15th.

Buff., Roch. & Pittsburg R. R. (Preferred), 3 per cent., payable August 15th.

Buff., Roch. & Pittsburg R. R. (Common), 3 per cent., payable August 15th.

Minn. & St. Louis R. R. (Gold Note 5s), coupons, payable August 1st.

Chicago, Mil. & St. Paul Rwy. (Preferred), $3.50 per share, payable October 16th.

Chicago, Mil. & St. Paul Rwy. (Common), $3.50 per share, payable October 16th.

The Independent

VOL. LXI NEW YORK, THURSDAY, AUGUST 9, 1906 No. 3010

Survey of the World

Politics and National Topics

At the close of an exciting factional contest, Gov. Albert B. Cummins, of Iowa, was nominated for re-election, by the Republicans, on the 1st, receiving 993 votes, against 603 for George D. Perkins, and 104 for S. W. Rathbun. Governor Cummins, whose public addresses have made him widely known as an advocate of tariff revision, had not made this the leading issue of his canvass, but had urged the enactment of a primary law and had opposed railway influence in politics. Mr. Perkins had the support of what is called the conservative element, the railroads and the opponents of tariff revision, the latter being represented in the canvass by Secretary Shaw. There are indications that a compromise was made, relating to proposed contests over delegates and to the platform. Governor Cummins appears to have accepted a tariff platform not in accord with the views which he has so often emphatically expressed. It is as follows:

"We are uncompromisingly in favor of the American system of protection. Duties on foreign imports should not be levied for revenue only, but should be so adjusted as to promote our domestic interests, enlarge our foreign markets, secure remunerative prices for the products of our factories and farms and maintain a superior scale of wages and standard of living for American labor. Wise and unselfish tariff laws maintained in the interests of the general welfare, equally opposed to foreign control and domestic monopoly, are essential to our commercial and industrial prosperity. We believe that all inequalities in the tariff schedules which inevitably arise from changing industrial and commercial conditions should be adjusted from time to time, and, condemning without reserve all assaults upon the protective system, we favor such reasonable and timely changes as will keep the tariff in harmony with our industrial and commercial progress. We favor the reciprocity inaugurated by Blaine, advocated by McKinley and Roosevelt, and recognized in Republican platforms and legislation."

Judge Towner, the temporary chairman, admitted in his speech that the party was "rent by a serious factional quarrel." He argued against attempting to "cure the iniquity of the Trusts" by revising the tariff. Secretary Shaw's name, when he mentioned it, was greeted by applause and hisses, and the hissing was continued for five minutes.——Senator Dick, of Ohio, called upon the President last week, and afterward said:

"It would be practically impossible for the Sixtieth Congress to revise the tariff; and, besides, it would be decidedly bad politics. There has never been an exception to the rule that when a political party controlling Congress has undertaken to revise the tariff two years before a national election, it has failed to elect its candidates at that election. However, we must at the proper time recognize and deal with the sentiment which demands a revision of certain schedules."

——Owing to current speculation concerning Secretary Taft's attitude toward an appointment to the Supreme Court, some weight is attached to the statement of Justice Brewer, in a published interview, that he thinks, "tho not speaking as one with authority, that Mr. Roosevelt is pushing forward Secretary Taft as his successor." He warmly commends the Secretary, who, he says, is a remarkable man and would make a great President. It is announced that the Secretary will assist Congressman Littlefield by speeches in Maine, thus appearing in opposition to organized labor, which, as represented by Mr. Gompers and others, is striving to prevent Mr. Littlefield's re-election.——The new primary law of Illinois was tested on the 4th. So far as

candidates for the office of United States Senator were concerned, the votes were merely expressions of preference. Senator Cullom (a candidate for re-election) defeated ex-Governor Yates.——On the 31st ult., the Pope received certain American pilgrims conducted by Bishop Gabriels, of Ogdensburg, N. Y., who delivered the following message intrusted to him by President Roosevelt:

"Tell the Pope that I send him my profound regards. I have tried to treat Protestants and Catholics alike, as my recent appointments show. I will try to perpetuate this policy. This republic will stand for many a century. I expect that there will be Catholic presidents as well as Protestant. I trust that they all will treat each other as I have tried to do."

Responding, the Pope expressed great love for the United States and high esteem for the President, saying that one reason for the growth of Catholicism in the United States was the liberty which the Church had enjoyed under every Administration, and was enjoying in a special manner under that of Mr. Roosevelt. ——It is said that upon the retirement of Attorney-General Moody, Secretary Bonaparte will succeed him, and that George Von L. Meyer, now Ambassador at St. Petersburg, will enter the Cabinet as Secretary of the Navy.

Mr. Bryan's Activity

Mr. Bryan wrote to Judge Owen P. Thompson, of Jacksonville, Ill., on the 17th ult., asking him to say to Roger C. Sullivan that he (Mr. Bryan) requested him to give up the office of National Committeeman from Illinois, in the interest of harmony. When Mr. Sullivan refused to resign, Judge Thomson published Mr. Bryan's letter, a part of which was as follows:

"Mr. Sullivan's presence on the committee contradicts all that we can say in the party's behalf. His corporate connections would harm the party far beyond his power to aid it, but this could be left for some future convention to deal with if he were actually the choice of the Democrats of Illinois. The fact, however, that he holds his office by a fraud and against the express wishes of a majority of the delegates to the State convention makes it impossible for honest Democrats to associate with him as a member of the committee."

Mr. Bryan also sent a message to the Democrats of Illinois, advising them to demand the resignation of Sullivan, "one of the leaders in the high crimes and misdemeanors committed against the Democracy of Illinois." Mr. Sullivan, in his reply, says that Mr. Bryan is mistaken and wrong again, as he was in his silver policy and the Bennett will controversy. He got his office, he adds, by a vote of 49 to 5, which was confirmed by the national convention; and the fundamental principles of the party "do not include recognition of political czardom." All this recalls the contest in the national convention of 1904, when Mr. Bryan, speaking earnestly for a minority report, opposed the seating of the Hopkins-Sullivan delegates from Illinois, and was beaten by a vote of 647 to 299, which disclosed his weakness as a candidate for the nomination. Last week's primary elections gave Sullivan control of the Democratic party in Chicago, and will probably prevent a renomination of Mayor Dunne. —— Prominent Democrats in Indiana are urging Mr. Bryan to use his influence to procure the resignation of Thomas Taggart, chairman of the National Committee, whose alleged connection with a gambling house at French Lick Springs has been involved in legal proceedings.——The opinions of Richard Croker concerning Mr. Bryan have been published at considerable length. They are wholly favorable. Mr. Croker admires Mr. Bryan's sincerity and hatred of corruption, believing him to be "deeply solicitous for the welfare of the poor," who have been "grossly discriminated against by the laws facilitating the accumulation of great fortunes by men who have not earned them." These remarks are the subject of sarcastic editorial comment in papers that have criticised Mr. Croker's rule in New York and the manner in which his own fortune was accumulated.

Secretary Root's Address at Rio

At a special meeting of the Pan-American Congress, held in his honor, on the 31st ult., Secretary Root delivered a long address which has excited much favorable comment in South America and elsewhere. "I bring from my own country," said he, "a special greeting to our older sisters in the civilization of America." We were all engaged, he continued, in working out the

same problem of popular self-government, and it was a difficult task. Capacity for self-government did not come to man by nature; it was an art to be learned. The requisite knowledge, wisdom, self-control, respect for law, consideration for the opinions and interests of others, and subordination of personal interests to the public good, must be sought by slow and patient effort. We were all conscious of shortcomings in our own lands, yet no student of our times could fail to see that not America alone, but the whole civilized world, was swinging away from the old governmental moorings and intrusting the fate of civilization to the capacity of the popular mass to govern. The world was making substantial progress toward more perfect popular self-government:

"Nowhere is this progress more marked than in Latin America. Out of the wreck of Indian fighting, race conflicts, and civil wars, strong and stable governments have arisen. Peaceful succession in accord with the people's will has replaced the forcible seizure of power permitted by the people's indifference. Loyalty to country, its peace, dignity and honor have risen above the partisanship of individual leaders. The rule of law supersedes the rule of man. Property is respected, the fruits of enterprise are secured, individual liberty is respected, continuous public policies are followed and the national faith is held sacred. This progress has not been equal everywhere, but there has been progress everywhere. The movement is in the right direction, and it is not exceptional."

But these results had not been accomplished, nor was progress to be continued, by national isolation. With nations, as with individual men, intercourse and association were the correction of the egotist. In promoting mutual interchange and assistance, all the American republics were engaged in the same great task. He understood it to be the function of this conference that not one, but all of the countries should benefit the others. Some advance might be made toward the complete rule of justice and peace among nations in lieu of force and war. The association of so many eminent men, leaders of opinion in their own homes, must result in friendship of inestimable value. Temperate and kindly discussion of matters of common interest would disclose common sympathy and aim, and dissipate misunderstanding. These beneficent results the Government and the people of the United States greatly desired:

"We wish no victories but those of peace, no territory except our own, and no sovereignty except sovereignty over ourselves, which we deem independence. The smallest and weakest member of the family of nations is entitled to the respect of the greatest empire, and we deem the observance of that respect the chief guarantee of the weak against the oppression of the strong. We neither claim nor desire rights, privileges, or powers we do not freely concede to every American republic. We wish to increase our prosperity, expand our trade, and grow in wealth and wisdom, but our conception of the true way to accomplish this is not to pull down others and profit by their ruin, but to help all our friends to common prosperity and to growth, that we may all become greater and stronger together.

"Within a few months for the first time the recognized possessors of every foot of soil on the American continent can be, and I hope will be, represented with acknowledged rights as equal sovereign States at the great World's Congress at The Hague. This will be the formal and final acceptance of the declaration that no part of the American continent is to be deemed subject to colonization. Let us pledge ourselves to aid each other in the full performance of the duty to humanity that this accepted declaration implies, so in time the weakest and most unfortunate of our republics may come to march with equal step with the stronger and more fortunate. Let us unite in creating, maintaining, and making effective all American public opinion, whose power and influence may prevent international wrong and forever preserve our countries from the burdens of such armaments as are massed behind the frontiers of Europe, and so bring us ever nearer the perfection of ordered liberty. Thus will come security, prosperity, production, trade, wealth, learning, arts, and happiness."

Mr. Root sailed from Rio on the 3d for Santos and ports further south. During his visit in Rio many extraordinary entertainments were given in his honor by the President, Foreign Minister Branco and others. For one of these the furniture had been imported at great expense, and Mr. Root rode in a carriage built at a cost of $12,000 for his use on this occasion. Among the President's gifts to Mrs. Root at the time of her departure were a large diamond and a casket full of rare coins.

Railway Passenger Rates Reduced

There was a movement in the State Legislatures a few months ago for a reduction of railway passenger rates by law. In Ohio, a bill making the maximum rate 2 cents a mile was passed. A similar bill had consid-

erable support in Pennsylvania, and the Attorney-General of that State brought suit against the Pennsylvania Railroad Company because it persisted in requiring a deposit of $10 whenever it sold, for $20, a book of tickets for 1,000 miles. This suit is pending. On the 31st ult. this company announced its purpose to reduce its one-way passenger rate east of Pittsburg and Erie to a maximum of 2½ cents a mile, and to sell, after September 1st, mileage books for the same territory at $20, without requiring a deposit, these books to be available for any holder. Use of the old books is confined to the purchaser. The reduction of one-way local rates is said to average about 15 per cent., altho thru rates to certain competitive points do not now exceed 2½ cents per mile. For passage from New York to Washington the charge will be reduced from $6.50 to $5.70. Vice-President Thayer says that the reduction has been under consideration for a year; and that improved facilities, with the construction of separate lines for freight trains, have enabled the company to handle a larger passenger traffic at lower prices. Probably the attitude of the people and of the political parties in the State has not been overlooked. Each of the three parties—the Republican, the Lincoln Republican and the Democratic—demands legislation making the passenger rate 2 cents. Some representatives of these parties say that the reduction to 2½ cents will not restrain them from promoting legislation for a 2 cent rate. The Reading Company gives notice that it will meet the Pennsylvania's reduction; the Baltimore & Ohio must make a similar reduction upon at least a part of its system; and thru rates to the West on other roads will be effected.—— The work of reducing passenger rates on all branches of the New York, New Haven & Hartford road to 2 cents a mile is in progress. President Ripley, of the Atchison, has issued an address to the people of Kansas, protesting against the agitation in that State for a 2 cent rate. His company, he says, in the last ten years has spent $17,000,000 in the State, in rebuilding and improving its lines, and the dividends in the same period have been only 28¾ per cent. for the preferred stock and 21½ for the common. Many passenger trains are run at a loss in Kansas, he asserts, and solely for the accommodation of the public.

Trust and Rebate Questions

Preparations have been made for a thoro presentation of the Government's charges against the Standard Oil Company before the grand jury whose sessions begin this week at Chicago.——The combination known as the General Paper Company, which was prosecuted successfully by the Government, is winding up its affairs.——Having inquired concerning the recent burning of two Burlington freight cars, said to have been full of rebate records, on an obscure siding near Greeley Center, Neb., the Attorney-General of the State has directed the County Attorney to spare neither time nor expense in making an investigation.—— In Council Bluffs, where the price of ice has been raised by a combination to $14 a ton, a majority of the Aldermen have decided that the city must have a municipal ice plant. In Jacksonville, Fla., vigorous prosecution of the associated ice-dealers has induced them to promise that their combination shall be dissolved and that the price shall be reduced to a maximum of 25 cents per hundred weight. Therefore the prosecutions have been suspended. The New York Aldermen, despairing of any action by District Attorney Jerome (of New York County) have, by resolution, called upon the District Attorneys of Kings (Brooklyn), Queens and Richmond counties to proceed against those who control the supply of ice in the city. In Toledo Judge Babcock has sustained in every particular the action of Judge Kincaid (who sentenced the ice-dealers to be imprisoned), and has exonerated him with respect to the charges made by the ice-dealers' counsel. Altho the dealers may avoid imprisonment for some weeks to come, it is predicted that eventually they will have to go to jail.——Herbert Knox Smith, Commissioner Garfield's assistant, says, in a published article, that, as a result of the recent official investigation, the secret discriminating rate granted to the Standard Oil Company on freight from Whiting to East St. Louis has been canceled,

and that the New York, New Haven and Hartford and the Boston and Maine railroad companies have discontinued the rates which practically excluded the independent oil companies from New England by giving great advantages to the Standard's shipments by water from its tidewater refineries to points on the coast, where low rates to inland markets could be obtained.

Cuba and Porto Rico

The city government of Havana has been reconstructed. On the 30th, the Mayor (a Liberal Nationalist) and all the Aldermen resigned, in anticipation of a request from President Palma that they should do so. Not long ago there was an attempt to procure a majority of Moderates in the Council by unseating several Liberal Nationalists, but Governor Nunez, the Liberal Nationalist leader, checked this movement by causing the Mayor to interpose with a veto. Resignations having cleared the way, a new Council was made, having a Moderate majority of three to one; and on the 3d this Council elected Julio Cardenas Mayor, to the great satisfaction of President Palma, who regarded the old Council as incompetent and probably corrupt. It recently attempted to alienate the city's slaughter-house fees for forty-five years to come (estimated at $8,000,000) in exchange for a new abattoir which should revert to the city at the end of the term above mentioned. Two Aldermen and the City Clerk were recently arrested and are to be tried for selling their official influence.——A committee from the Isle of Pines, bearing complaints of American settlers, is on its way to Washington.——Minister Morgan, in a report to the State Department, estimates the value of British investments in Cuba at $100,000,000 ($90,000,000 in railroads, $5,000,000 in shipping, and $5,000,000 in real estate and various industries); while American investments amount to $120,000,000. Canadian capital is represented by two banks, which have several branches and make long time loans on the sugar crop, cattle, etc., at rates ranging from 6 to 12 per cent. American manufacturers, he says, do not cater to the demands of the Cuban market, while the British strive to meet their customers' wishes.——Under a new law $1,000,000 a year is to be expended to encourage immigration, with special reference to Spain, the Canaries, Sweden, Norway, Denmark, and Northern Italy. Planters are required to make contracts with the laborers who are brought at public expense, and provision is made for inducing them to become permanent residents by enabling them to buy land.——Hobart S. Bird, now practicing law in New York, who for six years owned and edited in San Juan, Porto Rico, a paper called the *News,* has brought suit, in New York, for $100,000 damages, against Governor Winthrop, ex-Governor Hunt, Attorney-General Sweet, ex-Attorney-General Harlan, Secretary Post, Justice McLeary, and others in Porto Rico, alleging that they conspired to persecute him, ruin his business, and drive him from the island, making him defendant in fifty-nine libel suits, slandering him, inducing ruffians to kill his city editor, etc. All this was done, he asserts, maliciously and to prevent an exposure of these officers' misconduct.

The Philippine Islands

Dominador Gomez, the labor leader who recently assisted the Government in procuring the surrender of several prominent ladrone commanders, has been expelled from the workingmen's union in Manila on the ground that he served the Government as a spy.——An attack upon General Wood was made last week by the Leavenworth (Kan.) *Times,* which asserted that he was drawing two salaries and was guilty of misconduct in connection with the purchase of supplies. The first charge was at once officially denied. Three days later there was given to the press the complaint of Captain Z. M. Koehler (whose wife is the daughter of the late owner and editor of the Leavenworth *Times*) against General Wood, who caused him to be tried by court martial for intemperate language to his superiors. Captain Koehler has appealed to Secretary Taft, alleging that General Wood treated him unjustly. The controversy appears to have grown out of a quarrel between Captain Koehler and Major Hugh C. Scott, each having preferred charges against the

other in relation to Major Scott's administration at Jolo.

The Transvaal Constitution

Three days before the closing of the parliamentary session on August 4th, the Secretary of the Colonial Office, Winston Spencer Churchill, outlined to the House of Commons the plans of the Government for a constitution for the Transvaal, in accordance with the report of the commission which has recently returned from South Africa. Every adult male twenty-one years old who has been a resident of South Africa for six months, except members of the British garrison, is to be entitled to a vote under a secret ballot law. There will be one member from each district, as proportional representation was novel and unpopular. The Transvaal Assembly will consist of 69 salaried members, elected for five years each. Either the English or Dutch language can be used for public business. The upper house will, for the present consist of 15 members appointed by the Crown. The constitution will prohibit Chinese contract labor. No more Chinese will be imported after November 15th. The basis of representation will be the population according to the census of 1904, giving 32 members to the Rand, 1 to Krugersdorp, 6 to Pretoria and 30 to the rest of the country. A similar constitution will soon be granted to the Orange Free State. Ex-Premier Balfour attacked the proposals of the Government as an audacious and hazardous experiment. The Dutch had not had time to forget their former independence and what they had suffered, and it was to ignore human nature to expect them to be loyal to Great Britain so soon after the war. Premier Campbell-Bannerman at once rose and denounced Mr. Balfour in impassioned language, declaring that he had never listened to a more unworthy, mischievous and unpatriotic speech. This was received with a storm of shouts of "Shame!" "Apologize!" and "Withdraw!" from the Unionists, which drowned out the closing remarks of the Premier. A test vote was immediately taken and the Government was supported by a vote of 316 to 83.

The Wreck of the "Sirio"

The Italian steamer "Sirio," from Genoa and bound for Buenos Ayres, ran on a rock off Bajos Hormigas, near Palos, Spain, on the afternoon of August 4, and a large number of lives were lost. The ship had a crew of 127 and carried 700 or 800 passengers, mostly Italian and Spanish emigrants. Of these 348 Italians, 40 Spaniards, 14 Arabs, 10 Austrians, 6 Orientals, and 129 of unknown nationality are known to have been saved, and possibly others were picked up by the ships which came to the rescue. The ship had left Barcelona, and Captain Paradi, in order to save time was cutting too close to the shore. As the bow struck on the rock the stern sank, and in a short time the boilers blew up and the whole vessel went under. The greatest disorder prevailed and the officers and crew were powerless. The emigrants fought each other with knives and guns to get life preservers and boats. One boat was leaving the vessel filled with passengers when it was attacked by another crowd of Italians and they were thrown into the water. Before they could get off a second group dislodged them by force. Women and children were trampled under foot and robbed of life preservers without mercy. The captain attempted suicide, but was prevented and was rescued after going down with the ship. The Bishop of Sao Paulo, Brazil, was drowned owing to some one's snatching his life preserver from him.

The Mutiny at Sveaborg

The outbreak of the soldiers in the fortress of Sveaborg appears to have been part of a general revolutionary plan for simultaneous mutinies in the three great Russian strongholds — Sveaborg, which guards Helsingfors; Kronstadt, which guards St. Petersburg; and Sevastopol, which guards Odessa. The Government suspecting the plot undertook to arrest two hundred of the Sveaborg garrison, and this precipitated a premature revolt. The sappers and torpedo men started the mutiny and were joined by seven companies of artillery. Four companies of infantry remained loyal and turned their fire upon their comrades. Two lieutenants took the side of the

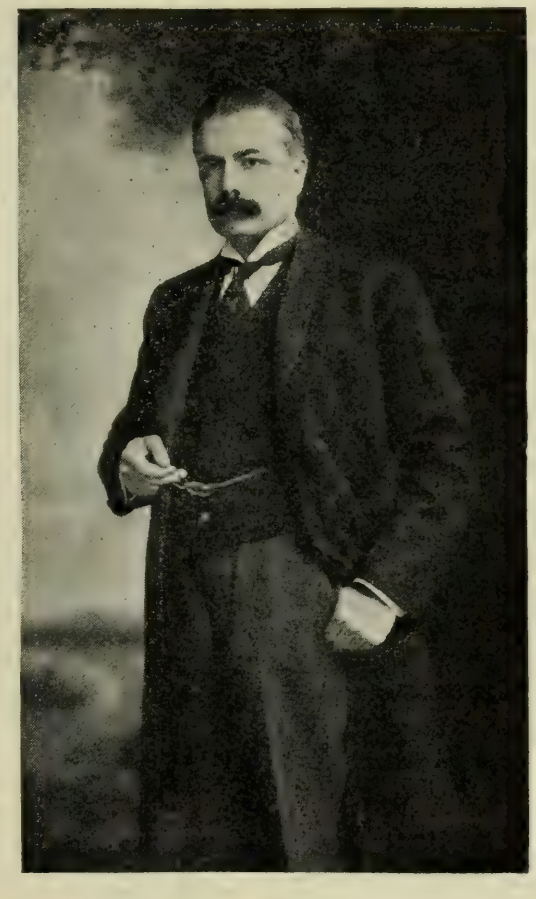
mutineers, who were further reinforced by several hundred civilians from Helsingfors, armed with rifles, among them one of the radical members of the late Duma. Sveaborg consists of seven small, rocky islands in the harbor of the capital of Finland, and all but one of these fell into the hands of the mutineers. This island, Nicolai, was, however, the main one and contained the food stores. Colonel Nataroff, who commanded the sapper battalion, was bayonetted and stoned to death and then thrown into the sea. The mutineers had both rapid-fire guns and 11-inch guns, and all Tuesday night and the following day the cannonading continued between the masked batteries of Sandhamm, which flew the red flag, and the loyal fortress of Nicolai, watched by thousands of people on Observatory Hill. Many scattering shots reached the city, wounding among others a man sitting on the veranda of the yacht club and killing a servant girl. The soldiers had been led to believe that the naval vessels in the harbor would take their side, but none of them did. Two battleships, the "Slava" and the "Czarevitch," were brought into action against Sveaborg, and bombarded the mutinous forts from a distance of fifty cable lengths. In the afternoon of August 1st the powder magazine on the island nearest Helsingfors was blown up either by a shell from the ships or by their own carelessness, and killed 50 of the mutineers. The bombardment by the ships had torn great holes in the fortifications and the barracks of the men were cut to pieces. Disappointed in their hopes of support from the fleet and short of food and ammunition, some of the mutineers were willing to surrender and raised the white flag, but that part of the fortress which still flew the red turned its guns against them, and there was internecine strife during the evening. It is estimated that five or six hundred of the mutineers were killed. One of the rebellious lieutenants was slain; the other surrendered. A boat put off from the islands loaded with civilian revolutionist leaders trying to escape, but it was sunk by the rapid-fire guns of the loyal Nicolai fortress. By midnight the Sveaborg mutiny was over. In the meantime all attempts to extend the revolt on the mainland had failed. On the morning of July 31st a party of revolutionary agitators from the city raised the red flag over the marine barracks at Skatudden and were supported by all the marines. They opened fire with machine guns from the third story on the torpedo boats and destroyers lying close to the shore and drove them out into the harbor, but from a safe distance they bombarded the

Map of Helsingfors, Finland, showing the barracks of Sveaborg and Skatudden, which were held by the mutineers.

barracks of Skatudden, which at the same time were attacked by Cossacks from the shore. They were captured before night, and 110 marines and 11 civilians taken prisoners. The Red Guard, the revolutionary organization of workingmen of Helsingfors, which took some part in the agitation resulting in the restoration of the liberties of Finland, called a general strike, but the order was not commonly obeyed. Captain Kock, the commander of the Red Guard, seized the Fredriksberg station, blew up the bridge and tore up the track leading to St. Petersburg for some distance in order to prevent the troops which were being hurried to Helsingfors from reaching that city. This precipitate action is said to have frustrated the plans of the revolutionary leaders in St. Petersburg, which was to draw away as many troops as possible from the capital by means of the demonstration at Sveaborg, so as to clear the way for a rising at St. Petersburg. But it is to be questioned whether there was any such deep-laid strategy. All the risings seem to have been local and ill advised, and the Social Democratic and the Social Revolutionary parties are not at all in harmony on tactics. The Finnish Diet, afraid to countenance any revolutionary movements for fear of losing their dearly bought liberties, passed a resolution calling upon the people to maintain a strict neutrality and to preserve order. Captain Kock and other leaders of the Red Guard were arrested and the organization disbanded. The Government reports its loss during the Sveaborg affair as 1 officer, 10 soldiers and 3 civilians killed and 75 persons wounded.

The Mutiny at Kronstadt

Following immediately upon the Sveaborg outbreak a mutiny likewise premature and unsuccessful broke out among the sailors in the fortress of Kronstadt. Notified by a cipher telegram that the fleet at Sveaborg had mutinied and was sailing for Kronstadt, "where we hope to find friends, not foes," the plan devised by the revolutionary committee was at once put into action under the leadership of agitators, among whom were Socialist members of the Duma. Just before midnight, August 1st, the signal was given and the sailors, sappers and pioneers left their barracks with purpose of capturing Fort Constantine. The telegraph and telephone wires were cut and a squad was detailed to kill the officers. A train was seized and run on to the bridge connecting the mainland with Fort Constantine, the nearest of the islands. Here they seized the arsenal, expecting to be able to hold it for an indefinite time and make it the center of the revolution, but they found that the ammunition for the guns which bore upon the mainland had been removed, probably in anticipation of this event. The artillerymen of Fort Constantine remained neutral, and made no opposition to the occupation of the fort by the sailors and other mutineers, who now numbered about 2,900. The red flag of the revolution, bearing the words "Land and Liberty," was hoisted from the ramparts. But a storming party was formed, composed of three grenadier regiments, which cleared the streets of Kronstadt of mutineers and mob, and then attacked the fort with two field guns and three machine guns, whereupon the mutineers raised the white flag about five o'clock in the morning. The civilian revolutionary leaders escaped in a boat to a steamer in the port. Drumhead court martials were immediately held, and before noon several squads of the rebellious marines had been shot. Six officers had been killed and nine wounded in the outbreak.——The Revolutionary Committee of St. Petersburg ordered a universal strike in support of a demand for a "Constituent Assembly with full powers elected by universal, direct, secret and equal suffrage"; but the workmen showed great reluctance in obeying the order. About 70,000 did stop work for a time, but the railroads continued running.——M. Hergenstein, a wealthy leader of the Constitutional Democrats in the Duma, of Jewish descent, was shot at his country home in Finland while walking with his wife and daughter. This is said to be the beginning of a policy of reprisals by the "Black Hundreds," or "Counter Terrorists," who threaten to assassinate a liberal leader for every Government official killed by the revolutionists.



The Rural Delivery Service

BY GEORGE B. CORTELYOU

POSTMASTER GENERAL.

FROM time to time publications appear asserting that ever since the rural free delivery service was inaugurated certain named States have been discriminated against, and that it is now proposed to carry this discrimination further by discontinuing routes or changing the service from daily to tri-weekly as the result of some new policy adopted by the Post Office Department.

These statements have been repeated and enlarged upon during the debates in Congress. The misconception appears to be widespread and should not be allowed to go uncorrected. That it is a misapprehension, pure and simple, I think can be clearly shown by facts of record. There has been no unjust discrimination against any State or any section. Still less has there been any disposition to permit political considerations to control in the establishment of the service. Whatever disparity may exist in the number of rural routes established in one section, as compared with other sections, arises from varying conditions, some of which are explained in the extracts from reports of agents of the Department that are given in this article.

George Bruce Cortelyou.

It is proper to bear in mind that for the first few years after its initiation as an experiment in 1897 the rural service was established without any fixed rules or regulations. The first formulated instructions were approved March 28th, 1901, requiring a patronage of one hundred families on a full route, the maintenance of roads passable at all seasons of the year, and the erection of boxes approved by the Department for the reception of the mails. With the rapid increase of the annual expenditures for rural delivery from $49,999.71 in 1898, to $20,819,944.69 in 1905, and the acceptance by Congress of the rural service as a permanent branch of the postal administration, no longer experimental, the necessity for the adoption of more precise methods of administration became obvious and imperative. The annual appropriation for rural service now exceeds that provided for city free delivery; the number of carriers employed is greater. Compliance with stringent requirements is exacted before free delivery can be extended to cities. Sidewalks must be paved, streets named, houses numbered; yet even when all these conditions are complied with, cities with less population than 10,000 or less than $10,000 annual gross receipts are denied the service.

Advocates of unlimited and unrestricted rural delivery say: "Put in the service first and wait for results; trust to time to educate the people up to its appreciation." The injustice to the taxpayer who pays for both services—city and rural—of such a discrimination be-

tween the two services does not need demonstration. The Department has not sought to curtail or withdraw service from any community which has shown within reasonable time an approach to appreciation of its benefits. A supposititious case was put before Congress in the discussion of the Post Office Appropriation Bill somewhat to this effect: A community in a territory in which were three small post offices, supplied by star route from a railway post office, had applied for and received rural delivery. Consequent thereon the subsidiary post offices and star route were discontinued. A number of persons living near the small post offices had been in the habit of sending for and receiving their letters and papers daily. When the rural delivery was established they had a better service than they had been used to, but when it was discovered that the rural routes did not handle the requisite number of pieces of mail per month they were changed from a daily service to a tri-weekly service. Intelligent people living on these routes were thus deprived of their daily papers and daily mail. They could not now turn to their neighborhood post offices, because they had been discontinued, and not being willing to give up their daily mail service they were forced to send to the railroad post office many miles from their homes.

The answer to this proposition is that no such curtailment has occurred or could occur under any ruling established by the Department. No community where any considerable portion of the people had enjoyed daily service by star routes and post offices has been deprived of rural service after it had once been established, without restoration of previously existing facilities, or has had that service cut down from daily to tri-weekly, nor is it likely that any such abridgement of service will be ordered under any regulations that may hereafter be adopted. It is the routes where people do not take daily newspapers and do not receive or dispatch daily mail, where, in fact, the petition for service has originated not with the farmers, but with the man desiring the position of rural carrier, that are mainly affected by the adverse inspection reports which are criticised as an attempt to deprive the farmers of the benefit of rural free delivery.

Tri-weekly service was established in South Dakota and other Western States where the farms are large and the houses far apart, in the very earliest days of rural free delivery, and that method of service is not confined to any particular section of the country.

It is claimed that there are more adverse reports on rural free delivery petitions from certain sections in proportion to population than from other sections of the country. The following extracts, taken almost at random, from the adverse reports of rural agents detailed to investigate petitions, are quoted as samples upon which departmental action has been based, and as giving the reasons for the action recommended:

(October 12th, 1905.)

The prospective patrons on this route, taken as a whole, are a class of people who care little for the benefits of rural free delivery. This territory is more than twenty miles from a railroad in any direction. Many of the inhabitants, I was informed by the man who drove me over the territory petitioning, have never seen a train of cars. The people, with few exceptions are both poor and illiterate.

This petition was gotten up by the postmaster with a view to increasing his cancellations. The petition was circulated by a man whose object was to get the position of carrier, should the department establish the route.

The roads are wood roads and neighborhood paths about one-half the distance. The people, in many instances, had to have it explained to them just what rural free delivery is. The applicant for carrier said, after he assured them that it would cost them nothing and that there would be no "box tax," as they called it, they were willing to sign the petition.

(January 20th, 1906.)

This route was planned and the petition circulated by a man who keeps a store and lives at the proposed distributing point, and whose only interest, as he told me himself, was the possibility of getting the position of carrier if the route were established. I am of the opinion that the names appearing on this petition were put there more thru his solicitation than from any desire on the part of the families designated for the benefits of the rural service.

The majority of the families to whom this route would extend service are of the poor tenant class. It is a conservative estimate to say that not more than fifteen per cent. are land owners. One-half the houses counted during the drive over the territory have but one room. Some of the houses did not even have a window. Most of the country is boggy and swampy. Only a small tract here and there is dry enough for cultivation. Seventy-five per cent. of these people have not the money with which to purchase the necessities of life, let alone money for approved mail boxes, subscriptions for newspapers and postage stamps.

(November 20th, 1905.)

This route as petitioned for is 25.3 miles in length. More than half of the 144 families named were not in sight from the road. The majority of the houses in sight are nothing more than single room cabins made of logs and chinked with mud. A number of them do not even have a window. The man driving me remarked in casual conversation that he supposed one-half of these people had never owned a lamp. In explanation, he stated that they either went to bed by dark or used the open fireplaces for what light they needed.

(October 1, 1905.)

Many of the people in this section are not in favor of rural free delivery, and say the petition was signed to oblige the man who carried it around, and some of the signers were just as quick to sign the remonstance against the route only a few days after. There are few schools in this section. It is stated by the most intelligent persons and verified by information received from postmasters and other officials, that a fair estimate of the people on this route who cannot read and write is between 50 and 60 per cent.

The people are satisfied with their present mail service, and most of them agree that a rural free delivery route would simply give some man a job with a good salary, and this is about my size-up of the situation. The amount of mail handled at the proposed distributing point on the day of my investigation was five letters, four newspapers and one registered letter, and this the postmaster informed me will fully cover the average. The amount of mail handled daily at all the post offices on the route will not amount to 25 pieces, and the cancellations of the four offices will hardly amount to $100.00 per annum.

The roads over which this route is proposed are blocked in two places by gates to a pasture, and the owner of the land refuses to take down the gates or to make them automatic. On the box delivery star route running over a portion of this territory there are no boxes erected by the patrons, and on inquiry as to the reason of this the information was elicited that "we get our mail at the post office, what little we get."

(December 8th, 1902.)

The proposed route is 27 miles in length. It traverses a very poor section of the country with not a single good farm on the entire line of the route. I found only sixty families altogether on the route and in the territory that could be covered by it. Thirty of these families are owners of the land and reside upon it, and thirty others are plantation employees. I found upon investigation that not more than fifteen families would agree to erect boxes on the route. The petitioners whom I met informed me that they did not know what the requisite conditions for the service were and that they were indifferent about the establishment of it, and signed the petition because they were requested to do so by the applicant for the position of carrier.

(April 15th, 1905.)

Four days in advance of my arrival the postmaster sent notice to the parties who wanted the route to meet me and show me around, but not one of these came. Failing to get any one else I prevailed on the postmaster, who knew the roads to accompany me, and together we went over the proposed route, the distance being 21.1 miles. Notwithstanding the fact that all of the roads are county public roads, eight gates were found and these gates are kept closed all the year round.

The country is very sparsely settled and the land is of the poorest. Five fairly good sized farms were found. In all fifty-nine houses were noted, of which the great majority were little one-room dirt chimney affairs and are occupied by the poorest of white and colored citizens. There was no interest manifested in the proposed service, outside of about one dozen families and two or three young men who would like to secure a job. Even the postmaster admitted that there was no excuse for it.

(February 1st, 1906.)

The party who took me over the route claimed that he missed his way and got on the wrong road, and after driving me until his horse was nearly exhausted trying to get himself on the right road, I had to return to the post office without making a satisfactory investigation. Having received notice from the Congressman that some persons better acquainted with the territory would take me over the proposed route if I would return to the office again, after giving the postmaster notice I went back but found no one to show me over any other territory than I had heretofore traversed. I was also told that the parties who owned the gates upon the roads I went over positively refused to remove them, and after losing all day trying to get some person to show me over the route I was compelled to leave without making further investigation.

(April 5th, 1906.)

The petition for this route was circulated by a gentleman who had in view the taking of the position of carrier and allowing some one else to do the work. After he learned that it would require his personal attention he lost interest in the route, and in fact did not want me to go to the trouble of examining the territory. The postmaster informed me that he did not know any one of the proposed patrons who was anxious for the service. It seems that the petition was gotten up wholly for the benefit of the person who wanted the contract.

One of the difficulties which those entrusted with the administration of rural free delivery have to encounter is the divergence of conditions in different sections of the country in regard to the pay of carriers. In the New England States and in the West, where forage is expensive and horseflesh dear, men with horses and vehicles can earn much more than the pay of a rural carrier. Much delay is experienced in finding competent persons willing to enter the service, and resigna-

tions because of insufficiency of compensation are numerous. In many States where horses are plentiful and forage abundant, $720 per annum—the maximum pay of a rural carrier—is regarded as fair compensation, and there are sometimes as many as twenty or thirty applications for one route. Hence the desire for the establishment of service sometimes proceeds more from the prospective carrier than from those who are presumed to be the expectant beneficiaries, namely, the farmers, and the outcry against discontinuance or curtailment of service emanates quite as often from the one source as from the other.

High-water mark in the demand for rural delivery service appears to have been passed, the number of cases covering applications for the service being nearly 50 per cent. less during the past fiscal year than during the preceding fiscal year, and on July 2, 1906, there were only 2,087 petitions for additional service awaiting action.

On July 2, 1906, the service was in operation on 35,874 routes, involving the employment of 35,768 carriers. Daily delivery and collection is given on all of these routes, except on 253, on which, because of sparse population, the service is given only every other day.

Estimating the actual average patronage per route at 90 families, the benefits of the rural delivery service are now enjoyed by 3,228,660 families, or 13,667,994 persons.

The most important fature of the work of the past fiscal year has been the institution of an inspection of the rural delivery service, particularly that upon routes where the amount of mail handled has shown an apparent lack of patronage, with a view to ascertaining the cause for adverse conditions, and the possibility of removing them so as to bring the service up to a reasonable standard of efficiency. This inspection involves the discontinuance, whenever possible, of all post offices where the patrons are adequately served by rural delivery; the discontinuance of anv route upon which it is found that, because of lack of appreciation of the service, the expenditure involved is unwarranted, and the substitution of every-other-day service for daily service where the patronage is sufficient to warrant continuance of the service, but insufficient to justify daily delivery. But before adopting either of the last two expedients, every effort is made to stimulate interest in the service or to rearrange the route so as to increase its patronage.

Rural carriers are required to deliver to the box of a patron all mail addressed to his family and collect all mail deposited in the box for dispatch. Registered matter and pension letters, which must be delivered in person to the addressee, and special delivery letters, the carrier is required to deliver in person at the patron's door, if within one mile of the route.

They are required to carry a sufficient supply of stamps, stamped envelopes, postal cards and newspaper wrappers. They are empowered to receive matter for registration, giving proper receipt for same. Also to accept money for the purchase of money orders, for which receipt must be given to the patron.

Rural carriers may carry packages of merchandise for hire from a patron, on request of the patron, provided the same are not mailable. They are not permitted to receive orders or solicit business for any person, firm or corporation.

The carriers employed in the rural delivery service are for the most part residents of the rural districts, and the character of the service rendered and the reliability of the carriers are at a high standard.

Persons desiring the benefits of service on a rural delivery route are required to furnish at their own expense boxes for the reception of mail to be delivered or collected by the carrier.

More than one family may use the same box, provided written notice of such agreement is filed with the postmaster at the initial post office.

Each box must be erected by the roadside, so that the carrier can easily have access to it without dismounting from his vehicle.

All boxes must comply with certain specifications fixed by the Postmaster-General as to size, shape and workmanship, and be made of galvanized sheet iron or sheet steel and be approved by the Department.

Each box must be equipped with some kind of signal by which the carrier may know there is mail in the box for collec-

tion and the patron may know that mail has been delivered by the carrier.

Patrons may have their boxes made to order by submitting the plan of the box and a sample of the material of which it is to be made, or the box itself, for approval to the postmaster at a post office located at the county seat, or to postmasters at first or second class post offices located in the county where rural delivery is in operation, and if it conform to the specifications of the Department it will be approved for use on a rural route.

The establishment of rural delivery at any post office does not change in any particular the rate of postage on any class of mail matter received or delivered from that office, except that the one-cent rate on drop letters does not apply when such letters are collected or delivered by rural carriers. Drop letters so collected or delivered must be prepaid at the rate of two cents for each ounce or fraction thereof.

The approximate cost of the service during the past fiscal year was $24,306,000, and the appropriation for the current fiscal year is $28,350,000. This includes what is necessary for the establishment of new service and the supplies necessary in maintaining service, and also the allowance to carriers who have been in the service twelve months fifteen days leave with pay, which, in the absence of authority of law therefor, has not been granted heretofore.

The question as to whether the rural delivery service pays is a subject for considerable discussion. In the light of actual revenue on mail matter dispatched by patrons of the service, the revenue is about eighteen per cent. of the cost. Considering the mail now delivered to rural districts in the aggregate, which has undoubtedly been greatly increased by the establishment of rural delivery, and a very large percentage of which yields the Department revenue, the rural service undoubtedly brings to the Department increased revenue, tho the total revenue from all mail handled by rural delivery carriers does not equal their pay. In this connection, however, the reduction of the drain upon the revenues by the discontinuance of fourth-class post offices, where the cancellations, in whole or in a large part, went to the postmasters, and the discontinuance of star routes, superseded by the rural delivery, should be considered.

There is absolutely no just foundation for the impression that political considerations in any way influence the distribution of the rural free delivery service. Prior to February 1st, 1902, when by Executive order rural carriers were placed under modified civil service regulations, the recommendations of the Representative in Congress for the district in which the rural free delivery was to be established as to the appointment of carriers were almost invariably asked and taken, irrespective of his political affiliations.

In the administration of so large a fund as is required to maintain the rural delivery service, it is essential, in justice to the taxpayers and in proper compliance with the obligations of those placed in charge of the service, that there should be some rules of construction which should not be deviated from in favor of one section or another, but should apply with equal justice to all. This it is the endeavor of the Department to accomplish to the best of its ability.

WASHINGTON, D. C.

Mastodonsaurus

BY HENRY AUSTIN

A MONSTER's head adorns my doorstep granite,
A fleshless Caliban, exceeding tame;
Keen snows attack it; kindly breezes fan it;
Still it abides the same.

Not the most blinding blizzard of Dakota
Could break its iron slumber; could affect
That irony of silence an iota
Whereby it wrings respect.

My friend, the man of science, hints that action
Once found a purpose in this passive stone;
And eke, in this odd lump of petrifaction,
Thought had a towering throne.

Altho that thought, like many a well-throned tyrant
(My socialistic scientist affirms),
Was ne'er to any higher food aspirant
Than fruit, instead of worms:

Which fruit this elephantine iguana
Plucked from strange trees; and then, with steaming breath,
Lay glutted, on the reeking-rank savannah,
An easy mark for death!

Ay, myriad foes besieged this lazy fellow,
This huge, mammiferous, pachydermatous fool,
Who only cared for fruitage moist and mellow,
Soft grasses, waters cool:

And who, like man, too often, half in shadow
And half in sunshine lolling, felt the lure
Of naught but sex, nor sought an Eldorado
Of Thought or Beauty pure.

"But still," my friend, the scientist, continues,
Tapping with fine French toe the stony head,
"Thru this dull oaf we men of balanced sinews
And soaring minds were bred.

"Odd, is it not? And I, for my part, wonder
Just when, behalf the evolute called Man,
The curious claim—vain flash 'mid priestly thunder—
Of special soul began."

"Why, as to that, dear dogmatist of science,
Factor of facts, which are but transient things,
You've proven, so you say, that scaly giants
Took to evolving wings;

"And reptile rose to bird; tho notes of sweetness
Were hardly hinted in the rattling scale
With which the hideous, hissing Incompleteness
Grooved out a slimy trail.

"Now, if these facts of yours be true—and truly,
Why should I doubt, when they are comforting,
Since they imply that out of shapes unruly
Must rise a ruling thing:

"A regal Power, with purpose on his forehead
And heart so large it needs for its embrace
(Altho its ancestors were saurians horrid)
Eternal time and space?

"And if, my friend, this onward, upward movement
Has held since earth from blazing gas began,
Explain me why this miracle of improvement
Must halt, when reaching man.

"For if 'tis easy in the opening portals
Of science thus man's climb from slime to solve,
'Tis quite as easy to suppose from mortals
That angels may evolve."

Then smiles my friend and answers: "Think how vital
Was once this head of stone: it owned a brain
Which to a loving mate could make recital
Of pleasure and of pain!

"But Soul you think is yours, the poet's lever;
Altho your ancestors, that reptile crew,
Had none. You pride yourself on mind, tho' fever
Your reason can undo.

"You claim that when the shadows grow to legions
And out goes life, like this benign cigar,
Your soul will rise, like smoke, to mystic regions
Where joys eternal are."

"Nay, friend, I push no claims; but, like an humble
Scholar, I wait until my Teacher moves;
In hope, because I note, altho men stumble,
Man rises; Man improves.

"And, as this poor stone head of saurian order
Perchance had some vague dream of man to be,
So I, who stand on Faith's dim, sunset border,
A grander dawn, a nobler shape, foresee."

PASSAIC, N. J.

Victory for the American Plan

BY HAYNE DAVIS

Secretary of the American Delegation of the Interparliamentary Union and Special Commissioner of The Independent to the Congress.

THE Interparliamentary Conference held the most important session of its history today in the Royal Galley of Westminster Palace.

This gallery is a grand room (about 50x150 feet), thru which the Kings of England pass into the Hall of the House of Lords when they visit the Parliament in person.

There were more than 500 members of the Interparliamentary Union present at this Conference, representing twenty-three National Parliaments, and during the morning session action was finally taken on the two propositions put forward at Brussels last year by Hon. Richard Bartholdt. In order to understand the situation it is necessary to recall the fact that this Union is composed of the most progressive men in the various National Parliaments. It has now over 2,000 members, organized into what are called Arbitration Groups in the several Parliaments in which the members have taken the trouble to combine in order to promote arbitration. These groups exist in every Parliament of Europe.

This is the fourteenth session of this Union, the thirteenth being held last year at Brussels and the twelfth the year previous at St. Louis.

Hon. Richard Bartholdt induced the Union to hold the Conference at St. Louis two years ago and to adopt the now famous Resolution of St. Louis, in accordance with which the second Hague Conference was called by President Roosevelt.

At the following session of the Union, held at Brussels in 1905, Mr. Bartholdt proposed that the Union declare in favor of converting this second Conference at the Hague into a permanent body, with power to assemble periodically and on its own initiative, thus constituting it a permanent council or congress of eminent statesmen, charged with the duty of devoting themselves to the task of finding out the best and most practical ways of improving the law of nations and the methods of its administration. He proposed also that the Union declare for a treaty of arbitration granting jurisdiction to the Hague Court over the classes of controversies specified in the treaty. Commissions composed of some of the most eminent men of Europe were appointed to consider these propositions and, of course, Mr. Bartholdt was placed on both these commissions, as he made the motions they were appointed to consider. After careful consideration both commissions reported in favor of most of the essential ideas contained in Mr. Bartholdt's plan. Several ideas were objected to, however, as being too progressive for Europe. Mr. John S. Williams, leader of the Democrats in Congress, came to this Conference of the Union. He had not participated in any of its former meetings, and the Republicans had largely outnumbered the Democrats at former Conferences.

At the first meeting of the American Group held here on the eve of the Conference Mr. Williams took naturally a leading part in the discussion, not only because his position as leader of the Democrats entitled him to do so, but because his individual strength made this inevitable. He not only endorsed all the points advocated by Mr. Bartholdt, but proposed going one step further, and the group unanimously voted to cast a solid vote for sustaining all of Mr. Bartholdt's resolutions and for the new one introduced by Mr. Williams.

Mr. Bartholdt had proposed that pecuniary claims be included in the list of questions which must be arbitrated. The Commission had eliminated this class of questions in making its report, and Mr. Williams moved to amend the report by inserting questions of debt. There may be some technical difference between questions of debt and pecuniary claims, but in any case Mr. Williams's

motion, which was carried, effectuates one part of the original plan proposed by Mr. Bartholdt.

The new proposition made by Mr. Williams was for each nation to pay each of its judges on the Hague Court the sum of $15,000 a year, and to instruct them to begin work at once upon the codification of the law of nations, so that there can be a definite body of international law capable of being applied to international disputes by the Hague Court.

As Mr. Bartholdt had proposed granting to the Hague Court the right to try certain specific classes of controversies, and constituting a permanent International Congress, first to codify the law of nations, and then to keep it up to date by due development, it is clear that Mr. Williams's motion indicates one method of executing the Bartholdt plan, and simply adds the idea of strengthening the position of the international judges by paying them all a fixed salary, instead of merely paying those who happen to be chosen for the trial of current controversies. Mr. W. J. Bryan was not at the meeting of the American Delegation which adopted these propositions, not being a member of the American Group, but as he has been a member of Congress he was entitled to a seat in this Conference, provided the Conference cared to tender him such an honor. The Conference did tender him this honor during its opening session, and he thus became a member of the American Delegation. And, for the first time, Mr. Bartholdt found himself at the head of a delegation composed of Democrats and Republicans in about equal numbers. Upon reading over the resolutions suggested by the two commissions Mr. Bryan proposed an amendment to this effect—that, in those questions which are reserved for settlement upon the battlefield, force shall not be resorted to until after an investigation by an International Court.

The adoption of this idea would divide international disputes into two classes. Those which the nation are bound to arbitrate and to accept the decision of the arbitrators; those which they are bound to arbitrate in the *first instance,* but over which they can go to war, if they find themselves unable to reconcile their consciences to the decision of the Court.

This was one of the ideas advocated by Mr. Bartholdt at Brussels, and it constituted the second paragraph of the treaty proposed by him. This also is one of those ideas which the Commission had stricken out as too progressive.

At the session held this morning Mr. Bryan made a very strong argument in favor of this idea, slightly modified in the Executive Council, from the form in which he first proposed it. And the motion made by him was unanimously carried by the Union in full session. Mr. Williams's motion to pay the members of the Hague Court a regular salary and to forbid them engaging in the practice of international law will come up later; so will another resolution introduced by Mr. Bartholdt at this present session. But at this moment the great work of this Conference is already done. It has gone on record unanimously: first, in favor of converting the second Hague Conference into a permanent body in the best form that may be found practicable, so as to codify the law of nations and keep it up to date; and, second, in favor of granting jurisdiction to the International Courts to try and *finally to end certain classes of controversies, and to try the question of fact in all sorts of controversies before resort may lawfully be had to violence.*

In assisting at this great victory Mr. Bryan paid a high tribute to the great work done by Mr. Bartholdt, in bringing the movement for peace founded on justice into so happy a condition as now, and he made special allusion to the fact that the particular idea which he advanced was already on the American plan proposed at Brussels by Mr. Bartholdt, tho he was not aware of this fact when he moved to amend the report of the Commission by the addition of this idea.

If there ever was any thought of this movement being turned into one of personal or party considerations, so far as the United States is concerned, that thought is now proved to be without any foundation in fact.

The leader of the Democratic party in Congress and the leader of the Dem-

ocratic party in the country have voluntarily turned up at this memorable session of the Union to save the day, just at the critical moment, for two important ideas which Mr. Bartholdt, the leader of the arbitration movement in our Congress, who is a Republican, had put forward at Brussels, and thus to unite all parties in carrying, far on the forward way, the movement which Roosevelt aided so substantially by convening a second Conference at the Hague.

LONDON, ENGLAND

The Closing Session in London

BY JUSTIN McCARTHY

THE House of Commons has just had its attention turned away from the reorganization of schools to the reconstruction of the army. The Education bill has not yet run its course, and cannot indeed accomplish that feat during the present session of Parliament, but will have to stand over until the autumn session. In the meantime the Secretary of State for War, Mr. Haldane, has just been introducing to the House of Commons his new scheme for the construction of England's military force. Mr. Haldane delivered a speech which lasted for nearly three hours, and he appears to have been completely successful in holding the attention of the House during this prolonged exposition. This result is all the more surprising, because Mr. Haldane's previous personal history would not have led us to look to him as a proficient in the business of war. He is a barrister by profession, and is the author of "Essays in Philosophical Criticism," a "Life of Adam Smith," and translator of some of the works of Schopenhaeur, and from the two universities in which he studied, that of Edinburgh and that of Göttingen, we do not expect much special training for the business of war. Mr. Haldane, however, seems to have found time from his professional occupations to study the whole subject of army construction, and he certainly made a strong impression on the House by his statement delivered there last evening. The object of his new scheme appears to be that a small reduction should be made in the actual numbers of the army, but the military force is to be rendered much more efficient in every sense and more readily adaptable to its actual purposes. The English military force is at present formed of three constituent parts—the actual army itself, the militia and the volunteers. The business of the militia is somewhat undefined, and it certainly cannot be described as in any sense constituting a part of England's fighting power. Its effect seems to me to be mainly the providing of a certain number of military titles for some local magnates everywhere who like to be called "colonel" or "captain," but do not care about the rough duties and the perils of actual military service; and also to find a sort of employment for humbler subjects of the empire. Mr. Haldane's scheme proposes to convert the militia force into a distinct and working part of the army and to leave to it and the British navy the task of securing the kingdom itself against invasion. The volunteer force he proposes to convert into a supplementary part of the army, which is to be called upon to undertake actual service in the field whenever the occasion may require and be sent to supply any sudden wants in the standing army itself.

These seem to me reasonable and acceptable propositions, but I need perhaps hardly say that I do not profess to be an authority on military arrangements, and we have not yet had any opportunity of knowing what arguments are to be urged against the measure by some who claim to have such authority. We all know that Lord Roberts and Lord Milner have been at work for some

Looking out into the House of Commons thru the iron grille which encloses the Ladies' Gallery.

time in an agitation to increase the strength of the army to an immense extent, but then I do not think that the recent career of these noblemen in South Africa is likely to make the British public very confident in their authority. Lord Roberts and Lord Milner are both impassioned advocates of what is commonly called imperialism, while the object of Mr. Haldane and his Government is to make the British army with the navy the means of defending England and all her possessions against invasion and not of effecting new conquests abroad and acquiring for England new foreign possessions to be maintained for the glory of imperialism at the expense and to the discredit of England and her people. We may expect some vigorous and exciting debates.

The death of Sir Wilfrid Lawson has removed from the House of Commons one of its most distinguished and most honored members. Sir Wilfrid was a great and genuine philanthropist, and he was known all over the world as a most resolute advocate of the teetotal principle. But he had qualities which we certainly do not associate in general with the stern and uncompromising advocacy of the teetotal cause. He was gifted with a marvelous sense of humor, which proved itself in verse as well as in prose, and he was one of the most amusing debaters who ever sat in our representative chamber. He never seems to have prepared his good things — they came to him by inspiration at the moment when he wanted them. It was his peculiarity to champion every great cause which he advocated by the weapons of wit and humor and to make his opponents seem for the moment at least absolutely ridiculous. I had the honor of his acquaintanceship, and I believe I may say his friendship, during many years. I sat with him, and usually sat near him for a great part of my working lifetime in the House of Commons, and even when I did not agree with him in his advocacy of some particular cause, an event which did not often happen, I could not but be delighted by his noble spirit and enlivened by his inexhaustible resources of wit and humor. He was a devoted friend to Ireland and a most earnest and consistent supporter of Ireland's demand for home rule. In his advocacy of the cause of temperance he went farther than some of his friends could follow him, and he sometimes gave offense to his opponents by his unsparing ridicule of themselves and their arguments. His sarcastic conversion of the familiar phrase "moderate drinker" into "moderate drunkard" is always likely to be remembered. But he had, none the less, a most genial and sympathetic nature, and even the moderate drinker was ready to forgive him for the perversion of the phrase, because of the great and good qualities of the man who invented it. The debates of the House of Commons must suffer sadly by the loss of Sir Wilfrid Lawson. For myself I do not think that House could seem anything like the same assembly as it was when I knew it, since it no longer displays the sparkling drolleries of Sir Wilfrid Lawson and of Henry Labouchere. Labouchere indeed lives yet, but he has withdrawn from Parliamentary life altogether, and makes his home in historic and artistic Florence. I am reminded of Labouchere just now, if any reminder were necessary, by the fact that he has been paying his public tribute thru his

newspaper to the noble character and career of Sir Wilfrid Lawson.

The House of Commons has, I am glad to say, some witty and humorous debaters coming up among its present members. One of the most promising and gifted among these is Herbert Paul, historian, essayist and journalist, who has lately often displayed in the House of Commons that bright humor and pungent sarcasm which we who are his friends have long known him to possess. Herbert Paul is, however, like Sir Wilfrid Lawson and Henry Labouchere, something much more than a mere humorist in Parliamentary debate; he is a man of strong political convictions, of high purpose and of most enlightened views. He remained out of Parliament for some time, because he could not stoop to propitiate the imperialism which was then displaying itself ostentatiously amongst some even of the Liberal constituencies. Now that he has returned to the House and that we have a Liberal Government which may be counted on to give no manner of encouragement to imperialism, I think it might be taken for granted that Herbert Paul will find an important political career opening up before him. The House of Commons has of late been so continuously and closely occupied with the details of the Education bill that it has not given much chance to its new members for distinguishing themselves on any other field of debate, and the House in Committee on many an important clause has been a strictly business assembly occupying itself with practical details quite unintelligible to the ordinary listener in one of the galleries who has not followed closely the new arrangements proposed by the measure. The House on such occasions has been but thinly attended by even its members, most of whom are content to wait until the bill comes back from Committee, and do not in the meantime care to sacrifice their amusements to such practical but not enlivening occupation.

Most of my American readers, I feel quite sure, have been interested or amused, or both interested and amused, by the sudden political storm which has broken out in England on the subject of women's suffrage. A considerable number of energetic ladies have made themselves prominent by initiating and conducting an entirely new system of campaign on behalf of the movement for giving the vote to women qualified on the same terms as those which give the vote to men. These ladies appear to have become convinced that the only sure way by which to hasten the accomplishment of their desired reform is to make life as nearly as possible intolerable to their leading opponents. With this object in view they have occasionally made demonstrations in the Ladies' Gallery, have endeavored to shout or scream down the Parliamentary opponents of woman's suffrage, and have actually thrust the banners of the movement thru the railings of the Ladies' Gallery and flourished them in the face of the astonished House. The Speaker has, I believe no official control over the Ladies' Gallery, for the reason that it is not technically within the domain of the House, and does not therefore come under his jurisdiction. Only the ordinary police rules for preserving order in any assembly could therefore deal with the Ladies' Gallery for the purpose of preventing disturbance there. Some of the ladies, however, have taken other and

Richard Burdon Haldane

more direct measures to impress their claims on the minds of their leading opponents.

American readers have, of course, long before this been made acquainted with the manner in which a certain number of these ladies attacked the house of Mr. Asquith, the Chancellor of the Exchequer, in Cavendish Square, with the object of terrorizing him into an acceptance of their demands. Mr. Asquith very prudently, I make no doubt, preferred to escape thru a back door rather than come into a personal argument of any kind with these devoted champions of woman's suffrage, the Suffragettes, as they are now commonly called in the newspapers. Now I should say at once that I am myself a strong advocate of the suffrage for qualified women, and have been so since and even before the days of my acquaintanceship with the late John Stuart Mill, one of England's great philosophical thinkers. I cannot see any reason why a woman who is qualified like a man by the payment of rates to hold citizenship in the community should be denied the right to give her vote for the election of members to the House of Commons. Women are now allowed to take a part in the management of much of our public business and to have seats on various boards and in many municipal chambers. I cannot see, for instance, why an educated woman should not be allowed to have a Parliamentary vote, while her coachman or her gardener is held qualified to exercise the suffrage. But my convictions on this point do not incline me to admire the recent demonstrations made by women on behalf of the proposed reform. On the contrary, my very sympathy with the cause of woman's suffrage only makes me the less disposed to feel any admiration for these recent demonstrations on the part of the Suffragettes. I do not think that slapping policemen in the face is the most likely method for convincing the British public of woman's capacity for conducting the business of the State. There seems to me no reason to doubt that the suffrage will before very long be conceded to woman on the same terms as those which qualify a man for its exercise, and I even think that the time will come when women may be elected to sit in our representative assembly, as they are already held to be thus qualified in some of our colonies. Even the recent somewhat violent proceedings of the Suffragettes can hardly be given as a conclusive argument against women's right to vote when we read the accounts just published of the riot which took place in Manchester when a great open-air public meeting was held to advocate the cause of woman's suffrage. There the riot was entirely started and carried on by the men opposed to the scheme, and the women were hustled and jostled and thrown to the ground in a manner which called for the forcible interposition of a great body of police in order to prevent more serious acts of violence on the part of those who desired to show that only men are qualified to be the makers of laws for civilized countries. In one sense, at all events, I think the riot at this Manchester open-air meeting is likely to prove propitious to the cause of woman's suffrage. It will show at least that woman is the lesser man only when she sets about to enforce her political opinions by slaps and blows and that if man can use that same kind of argument and yet be held qualified for the vote there is no reason why the suffrage accorded to the wearer of pantaloons should be denied to the wearer of petticoats.

London, England.

Some Celebrated and Historic Trees

BY GENERAL JAMES GRANT WILSON, LL.D.

Author of "The Presidents of the United States," Etc.

AMERICA is fortunate in the possession of the largest, and also the oldest, living things on the face of the earth. Scattered along the extent of the Sierra Nevadas from north to south are several groups, or groves, of *Sequoia gigantea* and *Sequoia sempervirens.* Some of the former variety are believed to be seven thousand years old, and are more than four hundred feet high. These gigantic trees are only exceeded in hight by the eucalypti of Australia. They were named after Sequoiah, a Cherokee chief, who invented the alphabet of eighty-five letters still used by his tribe in the Indian Territory. The author of a recent article on the subject of the sequoias of California forests says:

"They stood unnamed before man came into the world. Weigh well this stupendous fact, and let reverence temper curiosity when you visit these living temples; so far as the knowledge of man goes they are the greatest and grandest, as well as the oldest organisms to which in all the ages God has given life."

Until within less than a decade, two sequoias were growing in the New York Central Park. They stood on a grassy slope west of the Bethesda Fountain, near the Terrace and Mall. I happened to see them planted soon after the close of the Civil War, and altho they seemed strong and healthy, they certainly did not thrive in the same degree as many trees of other varieties on the same eastern slope, north of the Drive. The two sequoias had attained a hight of about forty feet before their death, a few years ago. One, sent from California by a friend of the second Duke of Wellington and planted in 1857 by the late Duchess at Strathfieldsaye, England, which I saw in September, 1905, is not less than one hundred feet in hight, with a trunk four times as large as the New York trees at the time of their removal.

The final steps in the recession to the Federal Government of the Mariposa and Yosemite Valley groups of sequoias, as far as California is concerned, was

The Celebrated Rubber Tree, Hamilton, Bermuda.

taken in March, 1905, when the Governor of the State signed the bill providing for the re-grant. In his last annual message the President commends the Pacific State's action.

Second only to the sequoia in age come the cypress and yew. One of the former has been proved during the past year by Mexican scientists to be above six thousand years old. It is a huge tree, standing in Chepultepec, with a trunk one hundred and eighteen feet in circumference. Sixty centuries ago this cypress, which attracted the attention of General Scott during the Mexican War, was an object of veneration among the natives, as the olive was among the Athenians, the plane tree among the Lydians and the banyan among the inhabitants of Ceylon. Yew trees are growing in Great Britain that are more than three thousand years old. One is to be seen at Fortingall in Perthshire, and another in an adjoining Scottish county, are both about the age just mentioned. In the churchyard at Darley Dale, England, is believed to be the oldest yew tree in the world. Second only to this one in age is the famous Twyford yew, and those that surround the churchyard of Caerhun, are claimed to surpass all others in England. The largest yew in circumference in Great Britain, many of its huge branches having died, is believed to be the one that stands near the entrance to Copped Hall, a former residence of the novelist Bulwer, where Cardinal Manning was born in the year 1809. But more interesting even than those already mentioned is the ancient yew, under which, in October, 1750, Thomas Gray completed his immortal Elegy. For seven centuries it has stood like a sentinel guarding the venerable church, with its monuments to Crusaders, and the beautiful churchyard of Stoke Pogis, perhaps the most attractive and interesting in England. The writer may be permitted to mention that he saw in September last some superb yew tree hedges at Graythwaite Hall, near Lake Windermere, the seat of Colonel T. Myles Sandys, M. P. Like most other trees the yew adds one line, about the tenth of an inch, to its circumference each year. Various reasons are assigned for the planting of the yew in churchyards. It is said to be sacred; the Druids sacrificed in groves of yews, and

The Duke of Athol's Famous Oak at Dunkeld, Scotland.

when Christianity superseded Druidism the character of the tree was preserved. Evelyn maintains that branches of the yew being used in processions, it was well to have the tree convenient to the church. Another writer affirms that the tree, being an evergreen, it was considered typical of the immortality of the soul. Be this as it may, the yew is an appropriate emblem of eternity owing to its longevity, and has always been a symbol of immortality.

Next to the sequoia, cypress and yew in longevity, comes the oak. This tree surpasses the three just named, and all others, in delightful associations, and especially in England, where they have been celebrated by Shakespeare, Milton and Dryden. Indeed, it may be said that almost all educated Englishmen are admirers of these kings of their most famous forests, which, in earlier days, were associated with the "wooden walls of old England," several hundred oaks being required to construct a ship of the line, of the style in which Nelson delighted. Many of the most interesting British relics of ancient days are the oaks, the annals of which take us back to Saxon times. Some that are still living were centuries old in the days of Harold and his Norman conqueror, and may have been growing and gazed upon by Roman Cæsar. Herne's oak, which the writer saw in Windsor Park before its fall in 1863; the Newland oak, mentioned in Domesday Book, and the still more gigantic oak at Lowthorpe, with a circumference of 55 feet. Then there is the Major oak, in Sherwood Forest, said to be fifteen hundred years old, under whose broad branches Robin Hood and his merry band held their revels, and the Winfarthing and Bentley oaks, believed to be equally ancient. There was a celebrated tree by Kentish Town, known as the Gospel oak, and another at Addlestone, beneath which Wicliffe preached and Queen Elizabeth dined. The Cowthorpe oak, near Wetherby, it is claimed is more than sixteen hundred years old, and the largest in England, measuring 78 feet in circumference. But this was exceeded in age by Domaray's oak, in Devonshire, destroyed by a severe storm in 1703, which enjoyed the distinction of having lived thru twenty centuries! A famous tree,

Oak and Sycamore Supposed to be a Thousand Years Old, Near Dunkeld, Scotland.

The Stuyvesant Pear Tree, New York.

mentioned in the Waverley Abbey charter, is the King's oak, at Tilford, among the largest in the south of England. It stands on the village green, between two ancient bridges over the River Wye.

In the Duke of Portland's Park of vast extent at Welbeck Abbey may be seen many grand old oaks, including the Glendale, eight centuries old and 50 feet in circumference. The Duke of Marlborough's magnificent estate of Blenheim contains many ancient cedars and oaks, and at Stoneleigh Abbey, the ancient Warwickshire home of Lord Leigh, whose wife is an American, there are many trees that are more than a thousand years old. Kimberley House, the ancestral residence of the fighting and pugnacious peer who is fond of putting in practice the motto of his family, *Frappez fort*, stands in the heart of an immense park justly celebrated for the great age and enormous size of its noble oaks and elms. The oaks and elms of Windsor Park are among the most ancient and interesting of England. In the adjacent Richmond Park are also to be seen trees dating back to the days of the Saxons. One of these, known as the "Schrew ash," attracts much attention. Under its wide-spreading branches Queen Elizabeth frequently sat. Early in the past century, poor women from adjacent parishes used to bring their babies, carry them 'round the ash a certain number of times, and repeating some kind of doggerel rhyme which was believed to preserve the child from blindness.

The great oak in Yardley Chase which inspired Cowper's beautiful lines, the "Yardley Oak," is still thrifty and strong, tho believed to be as old as the Norman Conquest. The Lords Northampton, from respect to the poet's memory and by request, as well as by legal threat, have preserved this monarch of the forest from depredation, to which it was formerly exposed, and which, unless stringent measures had been taken, would have been dispersed in relics over both the Old and New World. The oak is as gloriously green today as when Cowper wrote:

"Thou wast a bauble once—a cup and ball—
Which babes might play with; and the thievish jay
Seeking her food, with ease might have purloined
The auburn nut that held thee, swallowing down
Thy yet close-folded latitude of boughs.
Time was, when settling on thy leaf, a fly
Could shake thee to the root—and time has been
When tempests could not."

In the forest of Fontainebleau may be seen many fine oaks more than a thousand years old, and near Rouen is Rollo's oak, the tree on which the first Duke of Normandy hung his gold chain as a token of the good order he had brought the province. To save it, an arboricultural genius ten years ago fitted the oak with a solid new inside, and it is earnestly expected that the veteran of so many centuries will not discover the difference, but will continue to flourish for another thousand years! Some of our readers will doubtless remember Tasso's celebrated oak adjoining the convent of Saint Onofrio, Rome, which almost all pilgrims to the Eternal City visited before it was blown down by a violent gale in 1891. The writer was so fortunate as to see the historic tree in company with the poet-sculptor Story, a few years before its destruction. The trunk is still preserved as a precious relic in the convent. Macaulay visited and admired Tasso's oak, but strange to say he made a curious mistake in his fine essay on Addison, when he speaks of "The stately

oaks of Magdalen." The English historian's oaks of Magdalen College happen to be elms!

At Dunkeld House, one of the residences of the Duke of Athol, I saw what is claimed to be perhaps the finest oak in Scotland, and in the adjoining abbey the first larches planted in Scotland, in 1737, by the Duke of that day, were pointed out to the present writer. Several feet from the ground they were 16 feet in circumference, and a hundred feet high. A few weeks earlier I had seen, at Bishopthorpe, the residence of the Archbishop of York, larger and older larches, believed to be among the first introduced into England, as recorded by John Evelyn, in his earliest edition of "Silva," issued in 1662. Near Dunkeld are to be seen the last two survivors of Birnam Wood, mentioned in "Macbeth."* One is an ancient and noble oak, the other a still larger and superb sycamore, without an equal in all Scotland, and, as nearly as I could estimate, not less than 50 feet in circumference. Possibly it is surpassed by the great sycamore standing in front of Christopher North's cottage of Elleray, on Lake Windermere, of which Wilson said that

"Not even in the days of the Druids could there have been another such a tree. It would have been easier to suppose two Shakespeares."

A wide-spreading and well-shaped oak is to be seen in Ayrshire, and near it a stone monument, on which a crack-brained laird has left, on one side of it, a record of his eccentricity in the following exceedingly curious inscription:

"There is an oak tree a little from this, planted in the year 1741; it has twenty feet of ground round it for to grow upon, and all within that ground reserved from all succeeding proprietors for the space of 400 years from the above date by me, Andrew Smith, who is the offspring of many Andrew Smiths, who lived in Auchengree for unknown generations."

In April, 1906, the grand old oak at New Rochelle, under which Lord Pell stood when he signed a treaty with the Indians early in the eighteenth century, for the property now comprising the northeastern section of the Bronx, was destroyed by fire, leaving no other trace than a blackened stump. A few years ago a fence was placed around the historic tree to protect it, and within the fence a quantity of brush and leaves accumulated. These accidentally taking fire, the oak was entirely destroyed.

Of the cedars of Lebanon a recent writer remarks:

"There are only about 400 left. High up on the rock slopes Hadrian sculptured the imperial anathema against all who should cut these sacred trees. The Maronite peasants almost worship them, and call them the 'Cedars of the Lord'; and a recent Governor of Lebanon has surrounded them with a great wall, so that the young shoots may not be injured by roving animals. Yet, century by century, their number grows less."

In many of England's beautiful country estates may be seen Lebanon cedars, which their owners delight to say were introduced into their island by the Crusaders, as the writer was assured by the possessor of an ancient English castle, that the stone steps had been worn and scratched by their spurs! The same thing is to be seen on the deeply worn stone steps of Glamis Castle, celebrated by Shakespeare.

Precisely three hundred years ago Shakespeare purchased New Place, in Stratford-on-Avon. Some of the foundations of the house he built on the

Burnham Beeches. From a Painting Made By Lord Beaconsfield.

* MESSENGER:
"As I did stand my watch upon the hill,
I looked toward Birnam, and anon, methought,
The wood began to move."
—*Shakespeare.*

property may still be seen, also the party wall, and the grandson of the mulberry he planted. That was cut down in 1765, by the much execrated clergyman, Francis Gastrell. Malone's statement is that Gastrell destroyed the tree to save himself the trouble of showing it, and pulled down the house, because he objected to paying a monthly tax when he was awarded to Holmes and Whittier. The poets were much pleased and sent me charming acknowledgments, which are now included in the autograph collection of the Cambridge professor.

Perhaps the most interesting group of trees to be seen in England is the ancient wood called "Burnham Beeches," which were thrown open to the public as a park

A Group in Sequoia Park, California.

sent, having purchased New Place for an occasional residence. In 1742, Garrick and Malone partook of an entertainment under the shade of the Shakespeare mulberry tree. In the gardens of Christ Church, Cambridge, is a mulberry planted by Milton when he was a student at the university. One of the professors, whose guest I was a score of years ago, presented me with three leaves plucked from the ancient tree. One I still possess, the others were for- in October, 1883, when the Duke of Buckingham, as Lord Lieutenant of Bucks, dedicated it to the public to be kept "as an open space forever." The trees are the finest of their kind known. Disraeli delighted in this fragment of the primeval forest, and it was also appreciated by the poet Gray, who alludes to the giant trees in the closing verses of his matchless Elegy. He used to ramble among them from his home in Stoke-Pogis and there compose his po-

etic lines. Gray says, in a letter to Horace Walpole:

"Both hill and vale are covered with most venerable beeches. At the foot of one of these I sit (il penseroso), and there grow to a trunk for a whole morning. The timorous hare and sportive squirrel gambol around me like Adam in Paradise before he had an Eve; but I think he did not use to read Virgil, as I commonly do there."

The weeping willow came to this country thru the medium of Alexander Pope, who planted a twig on the banks of the Thames at his Twickenham villa, for many recent years owned and occupied by Henry Labouchere. The twig came to him in a box of figs sent from Smyrna by a friend. A young British officer who came to Boston with the army to crush the rebellion of the American colonies brought with him a twig from Pope's beautiful willow tree, intending to plant it in America when he should settle on lands confiscated from the conquered Americans. Disappointed in these expectations, he presented his willow tree to John Parke Custis, Mr. Washington's son, who planted it on the Virginia estate of Abingdon, where it became the progenitor of all our willow trees. At Pope's villa may be seen a son of the Smyrna willow sent to the poet.

On the island of Ceylon—that beautiful spot in the Orient, which has been likened to a pearl-drop on the brow of India—there stands the Bo-tree that is enshrined in the hearts of four hundred millions of people. It is among the oldest historical trees in the world, and has been dropping its consecrated leaves into the hands of pious pilgrims for more than two thousand years.

New York City.

Southern Manners

BY MRS. L. H. HARRIS

THIS is a delicate subject to discuss—more delicate than if the scene was laid elsewhere. For, in the South, we must reckon not only with what people are, but with the profounder self-consciousness of what they have been. This greatly increases their capacity for manners, which consist of so many polite and impolite genuflections that it is as difficult to interpret as it is dangerous to misinterpret them. And it may be well to say in this connection that the writer entertains no hope of satisfying certain monocle-minded critics of the North, nor the few choleric old gentlemen who still survive in the South with what she has to say upon the subject. The former are afflicted with an intellectual pharisaism which renders it impossible for them to understand or appreciate anything so different from themselves as the people of the South are in every particular, and the latter are the quarrelsome victims of an ante-bellum illusion which no reality can justify.

Southerners are naturally proud of everything, but they are especially proud of three things—their pedigrees, morals and manners—not that they have better ones than other people, but different. And, of course, the difference in pedigree accounts for the other differences. When a man is descended from a Puritan he may forget it, and lose the puritanical hall-mark from his morals and manners; but if he is descended from a cavalier he remembers the distinction down to the thirty-third and forty-fourth generation, and the memory affects his conscience and consciousness more than all the modern training he gets. He merely confesses the present, but tries to remain faithful to the *rôle* of his ancestor. This is the first thing which mystifies the Northern critic already mentioned, who regards the somewhat bizarre personality of Southerners with a kind of inquisitive sun smile. We are obliged to keep our light turned high and to show off some because we each have two characters to fulfill—one which condemns us, more or less downtrodden by facts to the days of

our own years, and one in which we tread a perpetual minuet of past glories. Such people are not to be interpreted in a narrow-minded, logical manner, but any way and every way thru the imagination. They still insist upon belonging to the realm of fancy. This is where the intellectual pharisees miss their cue. They lack imagination.

I have stated that we are proud of our morals, but little should be said upon this subject, and that little must be put in glittering generalities. For whoever goes into particulars about Southern morals goes into trouble. This supersensitiveness comes from the annoyance and persecution we have endured from the North, which has been more than presumptuous in its efforts to thrust upon us morals that are alien to our nature and unbecoming to our station in life. But those we have are so near being our manners that it is impossible to discuss the one without reference to the other. That is to say, we employ the grand manner when we are good and the romantic manner when we are bad. We have always been eclectics in everything, choosing even those virtues which we can practice sincerely in the place we find ourselves and making no pretentions to others. Our modesty consists in this diffidence, and it has not been appreciated in some quarters as it deserves to be. There is no such thing as ethical snobbery among us, and nobody would presume to hold a purely academic relation to God, as is so much the fashion in some other sections. In spite of all our frailties our manners toward Heaven are the best we have, and personally I have no doubt that the humility of eloquence in which Southern sinners excel is more pleasing there than the weaned righteousness of some other saints who are too intelligent to pray.

But we make up for this prismatic simplicity in morals with the complexity of manners we have toward one another.

The well-bred Southerner is always a social enigma, because he is himself and his favorite forefather at the same time. And if any one thinks he understands him, it is because he does not. His very frankness is his subtlety, his pose. Behind it he sits and watches the effect of his own mannerisms with all the shrewdness of a dramatic critic. Thus when a Southern gentleman, of "the old school," struts, pulls his goatee and storms at his goggle-eyed visitor with the details of his best war story, he feels the part, sees himself in the eyes of the other and enjoys the performance as much as if he were himself observing a good actor. And he is always a good actor; every Southern man and woman must be that. The duality of their personal consciousness begets a remarkable facility of expression.

We are born with or without manners in the South. We do not learn them, but they are a gift which we exercise, like having a genius for poetry. This renders them more various than they are, say in the East, where I am told that manners are the result more particularly of proper or improper training. And there, of course, one person could not have both kinds, but here it is not only possible, but natural, for what we call a well-born person to have both good and bad manners, according to the inspiration or provocation of the moment. Recently a Northern doctor of many sciences and philosophies, who is now teaching in a Southern university, was being pranced and lorded thru the Capitol of the State by a host who happened to be feeling that day like the distinguished cotemporary of Ben Hill and Alexander Hamilton Stephens. The doctor told me that he had never been borne along, uplifted by so many grand manners in his life. The awakening, therefore, was all the more shocking. Unfortunately, as they passed the State flag, he squinted at it instead of gazing reverently, and asked what flag it was.

"Sir!" exclaimed his erstwhile genial host, in a tone of deep indignation, "is it possible that you presume to teach in a Southern State and do not recognize the emblem of her glory when you see it?"

"But," protested the astonished victim, who is a native of Wisconsin, "would you recognize the flag of Wisconsin at sight?"

"No, sir! I would not. There is nothing remarkable about Wisconsin that her flag should be so well known!" With that he turned upon his heels, transformed in a moment from a gentleman into a boor, and left his guest a sadder but no wiser man.

"What did I do to merit such discourtesy?" he asked.

"Nothing is more offensive to a Southerner than for an educated man to show ignorance of the South. The inference he draws is that you failed to study her history, because, as a Northern man, you underestimate the importance of it."

This variety, uncertainty, insecurity of manner is not true, as I have already intimated, of the same class of people where I have been in the North and East. There is a uniformity, a solemn righteousness, about their courtesy, which is as lasting as their self-respect, because they keep their manners as much to demonstrate that as we keep ours to show our feelings. And so there is a safety in their politeness which may be counted upon. Thus the Southern visitor may unwittingly offend, or he may deliberately fan his prejudices around as if they were the peacock tail of his character, and still count upon the good humor of his host, because he never shows his likes or dislikes in his manners. For one, I have been at a loss to know how he does show them, unless it is by absolute exclusiveness. I have never been able to make out whether he is more tolerant than we are, or if he is so much more intolerant that we never see him in social relations to people whom he dislikes. Certainly his social equanimity is disturbing to the peace of mind in a person who has been accustomed to know when she was going right or wrong with people by their manners. I have even had the painful impression that he does not even care. In the South we do care. We have that kind of intolerance which often leads us to seek the society of those whom we dislike in order to show it.

Another thing impressed me even more than the reserve of their good manners—that not so many people in the North attempt what we call manners at all. I met some remarkable men and women there in this particular. They were rudely sincere, shockingly sensible, incontestably intelligent, but they had no mere politeness in their relation to others. They cared more for the positive expression of their convictions than they did for what any one thought of them. I have never seen such egotism. They said what they really thought, even if they trod the feelings of half the company under foot. We do not do this in the South except to our enemies. As near as I could make out, they have an awful intellectual head-hardiness toward life in general, which renders them insensible to mere emotion and feeling in others. And even when Northern people have manners, they do not always use them. In the South, we would no more miss an occasion for "showing our manners" than we would an opportunity to show our grandfather's sword. Once I heard two editors in New York say such things to one another about the use of the word "sort" as would have made them enemies for at least two generations in the South. One was old, the other young, but they simply came out and met one another mentally with grammatical battle axes, so to speak, and struck at one another with no regard for the delicacies of personality. They were nothing to one another, merely the spurred, sparring legs of opposing opinions, and so they had no feelings wounded. But in the South, we are always something to one another, friend or foe, really or prospectively, and must therefore cultivate the courtesies and discourtesies of personal intercourse more than other people.

For this reason also, we carry our sword next to our manners, not literally, but figuratively—we have been compelled to substitute much that is figurative for what was once literal in our conduct. Thus the Southern man continues to resent an insult with a challenge or the threat of one. But he never really fights a duel. It would be a scandal and an outrage for the friends of the prospective belligerents to allow them to go this far. Every one is concerned to prevent the tragedy—that is, every one except the women in the immediate families of the heroes. I doubt if there is a woman in the South who is not maliciously curious to know what would happen if friends did *not* interpose. But women have been indifferent peace-makers from the foundations of the world, and it is possible that their cynicism is not justified. Every Southern man at least believes that every other Southern man will "fight." Recently the writer had occasion to comment upon the meekness of a mutual acquaintance.

"Yes," said my companion, "but that

man is not really meek. He won't stand much. He will fight!"

"How do you know?" I asked; "did you ever see or hear of his fighting?"

"Certainly not!" as if my imagination demanded too much. "But I know he will by his manner. He shows that he is not afraid of any one."

"But is there any one to be afraid of?" I insinuated so provokingly that he lifted his hat and withdrew haughtily from the interview. Nothing is more offensive to Southern men than to intimate that every man-jack of them is not as dangerous to-day as when his favorite ancestor wore ruffles, knee buckles and a sword tied in his sash. And they are almost hectoringly courageous, but their absurdity consists in holding to the sword-point manner of preserving their honor when it is no longer the fashion to preserve it in this way.

The casual observer of Southern society does not always recognize these very great differences between their manners and those of other people, either because they lack insight, or because they see us only in commonplace situations. Our manners, more than those of any other society, prepare us for the grandeur of occasions. They are fashioned for heroic emergencies, and only look stilted and absurd because we are so often obliged to employ them in small affairs. For one thing, they enable us to keep a perpetual memorial day in honor of our traditions and our dead. The dead are the very greatest, most influential people in the South; and the names of some men are never mentioned here that words do not fall like flowers of praise upon their memories. This loyalty gives a startling sting to our manners. Not long ago two New Englanders were seated behind a Southern girl on a trolley car in New Orleans. They were manifesting their superiority, after the manner of their kind, by commenting adversely upon everything they saw. At last they passed the statue of General Robert E. Lee. "I wonder why Lee's statue faces North?" one remarked.

"Because, sir, you never saw his back!" exclaimed the girl, turning upon them a face like a little white helmet of war as she left the car.

And she believed it. The writer has never heard a Southern man tell of a battle between the Northern and Southern armies in such a way as to admit defeat. It cannot be done in our language. We have the words, but not that use of them. And it does not comport with our victorious manners.

On the other hand, when the superior elegance of our ways are recognized they are often misinterpreted. This is why the gallantry of the men and the coquetry of the women are vulgarized by some critics. The fault is in their mind, not in our manners. I have seen people renowned for their righteousness who were not nearly so pure-minded as the average Southern coquet. We believe in making all the distinctions possible between the sexes, and this has beautified our manners more than anything else except on those rare occasions when we have the opportunity to extol or imitate our illustrious dead. With us women sustain a poetic, romantic relation to men before they are married, and naturally their manners correspond to this *rôle,* their coquetry is simply the hexameter of prettified femininity. After marriage they sustain a sanctified relation to men, but never at any time are they intellectually or any other way antagonistic to them as they are in some other sections. This is why it is right and proper for men to kiss women's hands in the South, and it is immoral and improper to do so in the North, because there they have the wrong consciousness about such an act. It is either spectacular or offensive; with us it is a natural, masculine expression of homage, not for that particular woman, but for women. In the same way Southern men "make love" to women, not that they are "in love" with that particular one, but she is symbolic of her sex and receives his adoration in that spirit. It is because they do not and never can be made to understand this very beautiful distinction that some Northern girls make themselves ridiculous in the South.

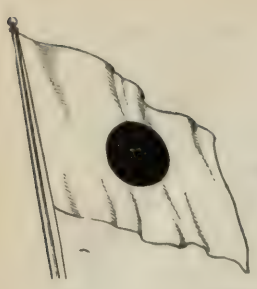
"Oh! Mrs. So and So," one exclaimed to her Southern hostess, "Mr. B. said such things to me last night, and he looked at me as if his heart would break. I fear his feelings are involved, and I would not cause him such pain for anything! What must I do, for I do not reciprocate?"

"Do not worry, my dear, Mr. B.'s feelings are always involved. He is used to it. And he has been looking at women as if his heart would break since he was a baby."

"Then he is not in earnest?"

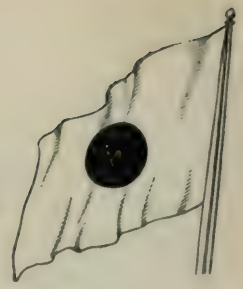
"Oh, yes, in a general way, but not in particular!"

"But he is flirting with me!" her indignation rising.



"No, he is just trying in the only natural way to make himself agreeable, and you should be grateful. It is not every man in this town who knows how to make love so gallantly."

But while we are discussing women I am reminded of another important distinction. It is considered "bad manners" here to gossip about one another, but we all talk about one another's ancestors, and in this way we have made some curious discoveries. For example, it is possible for a man to get on without a conspicuous pedigree. From this class, indeed, we select most of our public men. But ancestors are almost indispensable to Southern women. This is one reason why they all try to be Daughters of the Revolution or Daughters of something historical. Not one of them can go into society with the right kind of consciousness or preside over her household or train her children unless she has an ornamental forefather haloed somewhere in the background of history whom she may mention, or at least feel. He may be the worst of them all morally, but when it comes, say, to teaching her children to take the hurdles in life's long race spiritedly he counts for more than all the better ones. There is a funny-looking, high-nosed little boy hoeing cotton in Georgia these warm days who will be a great man as soon as he can, because his great uncle was a famous jurist and a colonel in the Confederate army. He has almost contracted a limp, because the uncle had his leg shot off at Chancellorsville and because of his mighty determination to imitate him in all things.



I do not know of any other section, indeed, where so many children thru the teaching their mothers have entered consciously into the best inheritance of the past. All children, North or South, bred in the cities are damaged and alike, but in the smaller towns and country places of the South the children are remarkable —little "greenhorns" with the most extraordinary manners and tempers. It will be very difficult to make a proletariat of them, and they lack the opportunity or substance to become "brutal bourgeoisie." My own impression is that they will remain aristocrats. And so the manners and memories of the South will save it for at least one more generation from any vulgarized form of socialism, even if it should prevail everywhere else.

In conclusion, it is my duty to correct a current error to the effect that the aristocratic class is decreasing in the South. As a matter of fact, it is increasing phenomenally. Formerly we had two classes—those who descended from a fine ancestry and those who descended from nobody in particular. But now we all "used to be aristocrats." The poorest of us can afford to trace our lineage back to some royal Virginia family. The war did it. And only a few witty observers like Owen Wister can tell the difference now between the fictitious sons and daughters of cavalier and those who have the real hall-mark of birth and breeding upon their manners and features. This is as it should be. When the cavalier and peasant stock have faced a common enemy, slept by the same camp-fire, mingled their blood upon the same battlefield, they become brothers, entitled to the same coat of arms and to the same manners and features as soon as they can get them. Thus it will be seen that more people are practicing manners in the South than ever before, because now nearly everybody has a pedigree which calls for them in particular.

NASHVILLE, TENN.

The Single Track in China

BY COURTNEY HUGHES FENN

[Mr. Fenn is missionary of the Presbyterian Board at Peking, and was in the British Legation during the famous siege of the Boxers. He is thoroly qualified to write on Chinese affairs and we hope from time to time to give our readers the benefit of his views on the momentous changes now taking place in the Celestial Empire, which make it with the possible exception of Russia, the most interesting nation in the world today.—EDITOR.]

A HOST of physicians are gathered about China today, and each one is trying to feel her pulse, to observe her symptoms, to diagnose her condition, to prognose the outcome. And it is just about as difficult to do so with the Dragon Empire as it always has been with other dragons, real and imaginary. The symptoms are here, plenty of them; but the pulse is so utterly erratic that the diagnoses are as various as the physicians, and the prognoses as divergent as life and death. The whole matter having been reduced almost entirely to guesswork is my sole excuse for venturing to write upon conditions and prospects at this time, which every one says is critical but as to what will happen, whichever way the crisis turns, no one knows, because no foreigner can ever be said to thoroly know the Chinese, and the Chinese are a long way from knowing themselves.

A considerable portion of my years in China has been occupied with evangelistic itineration; and a not inconsiderable portion of my days of itineration has been spent waiting for carts to pass. One day, within the distance of a mile, on a country road, I spent nearly half an hour extra time parleying and backing and catching hubs and learning patience; and all because the road was only wide enough for one cart, whereas numerous carts were passing in both directions all the time. As most of these roads lie at the bottom of more or less deep ravines, and the places where the roads are wide enough for two carts are exceedingly few, the situation may be imagined; yet not perfectly until you add the personal equation. The way the Chinese usually solves the problem is this: Each carrier starts into the ravine road unconcernedly. If he sees another cart coming in the opposite direction, he whips up his beast, at the same time yelling to the other man to stop, and makes his best speed, not to find a turning out place, but to get first into the narrowest spot in the ravine, so that the man coming to meet him will be compelled to do whatever backing or climbing of the sides of the ravine is to be done. When the two animals have about touched noses, neither carter is disposed to yield one inch. They begin discussing the "right of way" in no very mild tones, which wax more and more vehement, until both are yelling incoherently, at the top of their lungs, in language in comparison with which the proverbial Billingsgate would seem sweet. A crowd gathers, if people are within hearing. The carters perhaps beat each other's beasts, perhaps grab each other's queues, occasionally pulling them out by the roots in zeal for the right of way; and finally, the meeker man, or the weaker man, or the man whose passenger is anxious to get to his journey's end before dark, will back his cart to some slightly broader spot, or drag it half way up the precipitous bank, and the two carts will pass, the carters continuing to revile each other until out of hearing. With the exception of Peking, China's city streets are all laid out on the same plan: they are not thorofares to facilitate communication, but labyrinthine passages to impede business. The railroads so recently introduced follow suit, and are all laid single track. The explanation of the country roads is an easy one: very few of them are public roads, and the owners on each side are always on the lookout for an opportunity to push the road a little farther over to the other man's side. During the winter the carters make paths for themselves across the fields, constantly making fresh ones as the dust of our dry winters becomes too heavy in the old

tracks. But in the spring each farmer cuts lateral ditches across these tracks to force the carters back into the old road, or, rather, a little beyond it. The result is often that there is not room left for a cart to pass between two opposite ditches, and the consequent bumping is something awful, while the tortuosity finally resulting, in a long series of years, robs carters and their passengers of a very considerable fraction of their lifetime.

These phenomena, ludicrous as they seem to the Westerner, are thoroly characteristic of every department of Chinese life. Everywhere one goes one finds only a single track—in other words, what has been rather too euphemistically called the Chinese "individualism." The national conservatism, which is only now beginning to give way, has been the most prominent expression of the spirit, and the most extreme expression of it, because it is the nationalization of it. The old way is China's way; China's way is the only way with which a Chinaman may rightly concern himself, to modify this way is to shorten the axles of the carts, or to double the track, that others may pass freely on their way; it is to yield a fraction of China's right to the whole road; it is to make concessions without previous reviling and queue pulling.

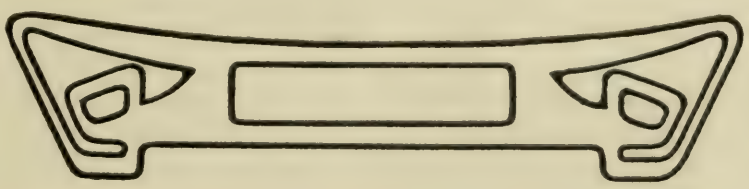
Even that great system of ancestor worship, which is at the basis alike of her conservatism and of her entire ethical philosophy, is an expression of the same spirit, the spirit of self-interest, so crudely but clearly expressed in the "Me and my wife, my son John and his wife, us four and no more" idea. The chief reason why this reverence for ancestors is so much better as a theory than in practice is that it breaks down under the weight of the selfish element in it. It is somewhat as it is with hazing or initiation or fagging. A boy forces himself to obey his father so as to be entitled to the privilege of making his sons do what he wants them to when he has a family; a girl submits to the whims and the cruelties of her mother-in-law, because she is looking forward to the time when she herself shall have daughters-in-law to abuse; and, theories to the contrary notwithstanding, the actual filial relations in the Chinese home will not bear comparison for an instant with those in the homes of our own land, great as the degeneration there is often declared to be.

As a result of their theory of the family the Chinese are clannish; but the effective united working of these clans is distinctly limited by the very spirit which led to their organization, namely, the desire of each man to combine the strength of others with his own to further his own ends primarily, the ends of the other members of the clan incidentally. It was right here that the Boxers broke down; the almost unlimited opportunity for the gratification of individual lust and greed overcame every other ambition; they drew upon themselves the maledictions of their despoiled peaceful neighbors, and the organization was rapidly committing suicide by gluttony when the prey was dragged from its teeth. The anti-American boycott failed in similar fashion. Patriotism was its war cry; but that patriotism vanished in thin air when some of its chief advocates happened to feel the pinch on their purses thru the stifling of trade in their own commodities. So it is with the threatened anti-dynastic movements. They cry "Turn the rascals out" not because they are any the less rascals themselves, but because they want their innings, their chance at the spoils, with which the Manchus have been gorging themselves for so many decades. Closely associated with the anti-dynastic movement is the present strong anti-foreign sentiment, with its cry of "China for the Chinese." It is not the sentiment of a few years ago, that is, "We want nothing to do with the foreigner, neither him, nor his learning, nor his methods, nor his wares, for we are the people and wisdom shall die with us"; but rather this, "We realize our past shortcomings, and are moderately grateful to foreign nations for opening our eyes, even if they have been rather brutal and selfish about it; but now that our eyes are wide open we are quite capable of looking out for ourselves, without the officious and mercenary assistance of outsiders, unless it be for a time, that of our neighbors and brothers, the Japanese, who have just demonstrated their superiority to the West, and who come cheaper, at the same time. Therefore we

would serve notice on all concerned, that, while we will not get ourselves into trouble by actually violating any contract already made, we will make no more of any kind which will involve the committing of the authority and wealth of China to the hands of aliens." It is practically the position taken by Japan twenty years ago; but with China the declaration of independence, to the surprise of almost every one—perhaps of herself most of all—has followed much more quickly her awakening than in the case of Japan. Being more of an overgrown baby than Japan was, the proclamation of maturity sounds all the more funny, but carries some weight thru force of avoirdupois, if it does not command moral conviction. China still insists that there shall be but a single track; but she is willing that it should be of foreign gauge, and that some foreign cars should run over it, provided that they are hauled by her power, and that her trains shall always have the right of way. There is no probability that a Chinese dynasty, if it should succeed in overthrowing the Manchu dynasty, would "double track" any of the way of China; and it is more than doubtful if there are enough Chinese leaders, either trained or capable of being trained, to run the locomotives even on the present single track lines. Among those high in influence there seems to be but one man, at the present time, who thoroly appreciates the advantages of the double track, and that is Yuan Shih Kai. That in him there is really great hope for the future has recently been emphasized in the downfall of his chief rival and Russia's crafty and unscrupulous friend, the Chief Eunuch. This gives Yuan a still more powerful influence in the palace, where he had already succeeded in doing wonders. The appointment of Dr. Tenney to the charge of Chinese students of high rank proceeding to America disproves the anti-foreign interpretation of his withdrawal from his late position. It is largely thru him that the great step of altering the gauge has been taken, and truly the change has been revolutionary. Some think too much so, for more than one class has been so ruthlessly thrust aside or trodden upon that many an enemy has been made. There are hundreds of scholars who have devoted ten, twenty, thirty, even forty, years to the pursuit of a high literary degree and official position, and now have suddenly been told, without warning, when the prize was almost within their grasp, that all these decades of study will count for nothing.

"That the wisdom of the sages,
Once the glory of the ages,
Is now nothing but a relic, when compared with Western arts;
That to speak a bit of English,
And right clearly to distinguish
That the earth is round and moving, is now all that counts for 'parts'."

It is a trifle disappointing and disconcerting, to say the least, and while it is not likely that the old régime will ever again be resumed, yet the way of the reformers will not be made easier by these "stickit" officials. It is by no means impossible, among the many conjectures as to the exact facts in the case of the bomb throwing at the Peking station, that it was an expression of disappointed reactionism, using the new to fight the new in a blindly, spiteful fashion, rather than an expression of anarchism.



Yet anarchism is abroad. There came into my hands the other day the translation of a foreign book, setting forth the purposes of the Anarchists, who are hand in glove with the anti-dynastic party. The translator, a Peking man, declares his purpose in translating the book to be: First, the extermination of the Manchus, that the Chinese may enjoy their rights; second, the extermination of all hereditary monarchs in Asia; third, the extermination of all rulers and officials, that there may be no interference with the right of every man to do as he pleases; fourth, the extermination of all wealthy men and their families, that all men may have an equal share; fifth, the extermination of all disciples of Confucius, that no man may be bound by the teachings of the sage; sixth, the extermination of all married persons, that free love may reign. Here is the single track idea with a vengeance! While it is not likely that such ideas will find a very numerous following, yet they are a decidedly nasty sort of yeast to be fermenting in the rather chaotic dough of present Chinese thought. In a less extreme form they are, with the somewhat menacing addition of anti-foreign sentiment, the propa-

ganda of the hundreds of half baked students who have returned, within the past few months, from Japan, disgruntled at the compulsory submission to the discipline of her schools, and having imbibed just enough of her modern spirit to distort it into an impatience of all authority and an exaggeration of the single track idea. Imagine the shock to all the sensibilities of the officials of Paotingfu, on having some of the students of the city march boldly, uninvited and unushered, into their banqueting hall, to enter an insolent complaint as to some dissatisfaction with food or lodgings! This is indeed "Young China" gone mad!

One of the most mooted questions of the time is as to the relation of the numerous recent anti-missionary outrages to the general situation. How far are they symptomatic? Of this but a few words, important as it is. To the mind of the present writer while there was, in all of these affairs, an element of the anti-foreign and another element of the anti-missionary (the latter largely because the missionary is a foreigner), yet each case was distinctly sporadic, and all together are quite insufficient as an indication of a widespread movement. The Lienchou massacre would probably never have taken place had it not been for the boycott; the Nanch'ang outrage would never have been perpetrated but for the extraordinarily high-handed proceedings of a French priest, who totally misrepresented the missionary spirit and attitude in China; and the fact that these untoward events fell so near together is probably little more than a coincidence. A series of such events, distorted as they are in the now numerous, independent and abnormally influential native daily papers, is quite likely to produce some general movement, or at least other local outbreaks; and it is symptomatic of a prevailing unrest, from which almost anything might grow; but is not indicative of an already organized movement, such as that of 1900, or of any special dislike for missionaries as a class, or of any resurgence of the purpose to drive the foreigner from China. It is extremely desirable that both missionaries and all other foreigners should do all they can to cultivate a true *amour propre* among the Chinese, as well as to refrain from insulting that which they already possess; and in this regard one need have no hesitation in saying that Protestant missionaries, almost without exception, are exercising the utmost discretion. Having refused the proffered official rank, which the Roman Catholics had demanded, they have no intention of exercising any of the prerogatives of the native magistrate.

Are foreigners in China in danger? Yes, we are always in a measure of danger, such as few of us appreciated before 1900. The present, being a time of especial excitement and ferment, is, in some respects, a time of special danger; most crises are. But here in the north the only really menacing dangers would seem to be two, namely, first, the longer or shorter period of anarchy almost inevitably attending a revolutionary movement; and, second, the violent renewal of anti-American demonstrations, in case our uncertain Congress refuses to make reasonable modifications of the Chinese Exclusion Law. In the latter case it is to be feared that the Chinese will not even leave us a "single track" on which to get out. China is in the throes of an evolution violent enough to be a revolution; and the very violence of this development may avert the threatened overthrow. She never needed help more than at the present moment, and really was never more ready to appropriate and assimilate it, when given in the right spirit. A little kindly consideration may make her a valuable friend; a little unkindly indignity may make her, some day, indeed a "yellow peril."

PEKING, CHINA.

Magdalen

BY ANNIE CAMPBELL HUESTIS

"Where are you going, weary feet,
Feet that have failed in storm and flood?"
"I go to find a flower sweet
I left, fresh growing, near a wood.
The winds blow pure from many a hill,
And hush to tender stillness there.
Shall not this restless heart be still,
And grow more innocent and fair?"
"Not so; for sin and bitter pain
Can never find Youth's flower again!"

"Where are you going, wistful face,
Face with the mark of shame and tears?"
"I go to find a quiet place
Where no one sees and no one hears.
The beauty and the silence there
Shall thrill me thru and still my pain,
Shall touch my hardness into prayer,
And give me back my dreams again."
"Not so; for Sin has closed the door
On Youth's fair dreams forevermore."

"Where are you going, heart of woe,
Pitiful heart of fear and shame?"
"A strange and lonely way I go,
Where none shall pity, none shall blame.
Far with my sin and misery
I creep on doubtful feet, alone;
No human heart can follow me
To mark my tears or hear my moan."
"Nay; but the never-ceasing sting,
The clearness of remembering!"

"What do you see, O changing face,
Alight with strange and tender gleams?"
"I near the hushed and holy place
Of One who gives me back my dreams."
"Where are you daring, eager feet,
Feet that so wild a way have trod?"
"O bitter world, no scorn I meet.
Sinful and hurt, I go to God!
On my dark sin, forevermore,
A sinless Hand has closed the door."

HALIFAX, NOVA SCOTIA.

The Idle Boy

BY WILLIAM NOYES

[Mr. Noyes has charge of the instruction in manual training in Teachers' College, Columbia University, and is President of the Eastern Manual Training Association. As appears from this article he is an earnest advocate of productive industry by young people instead of the system of pretending to work now prevailing in many of our schools.—EDITOR.]

SHALL a boy in his early teens learn to work? Once there was no question about this. Within a generation or two a large part of a boy's education consisted in the work he had to do. When only one-eighth of the population lived in cities of 8,000 or more, which was as late as 1850, almost every boy either lived in the country or had access to it. Here he learned how animals were born and how to care for them and how to get work out of them; he learned about the crops, their variety, their rotation, their seasons and their diseases. He could observe how things were done, both on the farm and in the neighboring shops, all of which were wide open to view. He had chances to try his hand at various sorts of activity, and thus could find his own bent for a calling. Nor was he only watching; he was also working. His own constructive powers were called into play, whether in making toys and traps for himself or in helping in the multitudinous operations on the farm, in the shop and in the home. One could easily make out a list of two score or more distinct occupations in which boys took part on the farm. In addition to this there was the definite system of apprenticeship in the trades, so that boys were educated by learning to work at some particular trade. Work was a means of education in the large sense of the word. It was also an important object of such formal education or "schooling" as was provided. The "learning" of the school was intended to supplement the labor of the farm, the home and the shop in making labor more intelligent and efficient. And, on the whole, the result was good. Industrial efficiency was actually attained by the educational methods pursued.

In great contrast with these conditions of all around training which prepared the child for industrial life, stand present conditions. For a growing proportion of the children the place of the fields and woods is largely taken by the dirty, barren street, and the workshop constantly open to view is converted into the factory into which the child may go only to be exploited and degraded. The child has been robbed of all of those out-of-school educative influences which centered in the domestic industries. To take their place the only educative institution which we have developed is the school. Whereas once there were two sides to the child's education, balancing and reinforcing each other, there has come to be but one which absorbs all the serious thought and effort of the child. As the city has been overgrowing the country and the apprentice system has died and the home has surrendered its employments, the school has grown in importance. But the functions which the farm and the little shop and the home have been obliged to abandon, the school has not assumed. To be sure, the number and variety of subjects in its curriculum has increased, school attendance has been made compulsory for longer terms and to a greater age, but in one respect it has utterly failed. No provision has been made to furnish that valuable industrial experience to the child which the earlier forms of industry did provide. Children are crammed with information and "trained" in various ways, but they have neither the opportunity nor the necessity for work. Not only is it true, as Superintendent Seaver, of Boston, has said, that "The traditional balance between learning and labor has been upset, and learning taken the whole time"; it is one particular kind of learning that has taken the whole time. Familiarity with industrial processes, which once constituted a large part of the "conventionalities of intelligence," has been relegated into obscurity. Literacy has become a sort of a fetich which we confidently believe will cure all our ills, while a large and important factor in education, learning by work, has been left to the horrible dens of exploitation in which many of our children are sooner or later caught as unskilled child laborers.

This horrible problem of child labor is, after all, but a part of a larger problem, another phase of which is child idleness. To a majority of city children after leaving school, either for the day or for life, there is but one alternative open, either to be exploited as child laborers or to be idlers on the street thru much or all of their waking hours. We have taken away the time-honored employments of children and have left to them only the choice between overwork and idleness. As any intelligent city parent can testify, it costs more to keep a boy at some worthy and educative employment than to keep him idle. What was once a matter of easy domestic adjustment has become a great social problem.

That problem, at least from the educator's point of view, is to unite labor and learning.

The only serious attempt to solve this problem has been by the introduction of the so-called manual training into the schools. The movement started naturally enough in the making of simple kitchen and other household utensils, at a time and place when industry was largely domestic. But in modern city life the center of gravity of the home has moved from the kitchen to the sitting room, if, indeed, there can be said to be any center of gravity in a modern city home, which is a little squeezed-in flat, where the principal functions are eating and resting. Its functions have become so restricted that there is very little that the child can contribute, especially in the way of hand-made utensils, that is of any real value. The demand for his work is an artificial demand, created for his good, and he is generally astute enough to perceive that fact. So far as he is concerned, the process of making these utensils is fictitiously interesting and factitiously important. The work that is given him to do has no vital and evident relation to the great world of industry about him. Production is no longer domestic, but has become social. Hence, to keep the boy still in the personal craftsman stage, when almost everything is being produced mechanically and socially, is to deny him one of his greatest inheritances. Yet all that the constructive hand-work commonly done in the schools does for him is to take him to

the town or craft stage of society, and there leave him outside of the threshold of modern industry. To modern industry proper he is not introduced under the guidance of wise teachers. He sees it with no perspective. He is plunged into it when he leaves school—I cannot say when he is educated—under the compulsion of learning to do one minute act. He is not educated by the industrial system as his grandfather was; he is simply fed into its maw.

Even if our manual training methods were well planned with reference to modern industry, how much of it would a boy be likely to learn who spent only one-one-hundredth of his waking hours at work? Yet that is all that a boy in our best equipped schools gets in "manual training." Such dabbling as this cannot be dignified by the name of work.

My plea that children be taught to work does not mean a lack of recognition of the importance of play. Play is important because it is the spontaneous outflow of energy. By it child nature is kept plastic and mobile, and thus able to develop individually and not be at once crystallized into a fixed character. Animals have only a short childhood, for their play days are soon over. But it is one of the glories of humanity that the period of childhood is prolonged. The play days of the best men and women are never over. This prolongation of infancy, when energy is spontaneously expressed, when the individual is still adaptable, contains the hope of racial improvement. On it depends the possibility of education at all. In pleading for work as part of the education of the boy, I do not forget the need of a proper balance between play and study and work as the ideal. He needs to play in order that he may continue to grow. He needs to study in order that he may learn to think. He also needs to work in order that he may gain the habits of a social being.

But very unequally do we provide for the needs of the boy. The school is organized to teach him to acquire information and to some extent to think. We leave him alone to devise his own plays, and only recently have we begun to appreciate that he must have opportunities to play other than those of the asphalted street between two rows of buildings. That the boy also needs to work we have hardly recognized at all.

The public school to which I look forward is an institution which will grow out of modern life and be an integral part of it. Among its objects will be the elimination of illiteracy. But not only will it teach the child to read and to write; it will also train his senses, so that he can see straight and recognize facts; it will cultivate his reasoning powers, so that he can draw proper inferences from facts; it will develop his self control and his courage, so that he can make use of facts for his own and others' advantage; it will implant in him the scientific habit, so that thruout his life he will be a student; it will keep him supple, plastic and adaptable by providing full and varied opportunity for play, so that he may long keep young; it will develop his æsthetic sense, so that he can translate all his experiences into forms of beauty; and, not least, it will teach him how to work, so that he will be master of the most fundamental and unifying of social functions, namely, industry. To enable the child to see straight and to reason well, to play hard, to appreciate beauty and to make good things—these will be the essentials of education.

New York City.

Literature

New Histories of England

THE pen of the historian was never busier than it is now in England; but there is not a living writer who has reared a great monument comparable to that of Freeman, Stubbs or Gardiner. Indeed no one seems ambitious or daring enough to attempt an account of a long and difficult period such as these famous historians have encompassed. The present workers, however, are by no means of mediocre character; they are applying a finer analysis and a sharper criticism of their materials than did many of the older writers; and now and then there is a faint sign of an attempt at a new synthesis or at least a restlessness and impatience at the eternal rehashing of old stories with new embellishments.

Meanwhile the special searchers are pouring forth their results in such quantities that no single worker can hope to write an accurate, well-balanced and complete story of England. So Professor Oman thinks; and the new *History of England,*[1] planned by him, is being written by six students, each well qualified to do the portion assigned to him. The second volume of this series, covering the period from the Norman Conquest to the accession of Edward I, is by Mr. Davis, a Fellow of Balliol College, who has already shown originality and capacity in several stray studies, especially in the field of medieval history. The age which he has now undertaken to cover, is, as every one knows, of first-rate importance in the history of English institutions. Mr. Davis has a great theme and he has done it justice; thoroly as it has been covered by many historians before him, he adds touches of freshness and vigor to an old narrative. He writes in a straightforward, connected and concrete fashion; what he says has a meaning; there is little or no stale and *jejune* moralizing or "historical philosophizing." Once in a while he writes a doubtful sentence like this: "The masses are divided between their ancestral love of liberty and their gratitude for the orderly despotism of their alien rulers," which is not only a misconception of ancestral conditions, but also of the political consciousness of "the masses."

Professor Oman's series closes with 1815, probably owing to the almost insuperable difficulties connected with writing satisfactory modern history. However, for the first part of the nineteenth century we have our Walpole, Molesworth and Martineau, to say nothing of special studies. For the latter half of the century we have two rather extensive histories by Mr. Paul and Mr. McCarthy. The fourth volume of the former's work,[2] which is now before us, opens with the Turkish troubles of 1876 and closes with the defeat of the Gladstone Government in 1885. Mr. Paul's views of the function of the historian have been frankly announced in his "Life of Froude" and other places and they are exemplified in his own historical writings. He has never trained his mind by research and exposition in some period of the distant past into which our feelings are not strongly projected; indeed he has contempt for the very discipline which such a training gives and for the spirit of fairness which it engenders. Now the passion for judging everything and everybody may be a useful one, but it is apt to take on the form of the pamphlet rather than the serious work designed for instruction. Mr. Paul makes short work, for example, of Beaconsfield's triumph at Berlin—"it was all play-acting and theatrical heroics." This is not quarrelling with Mr. Paul's entire book, for it is a most readable political history, and will be used with pleasure by those who want to know about recent British imperialism, the Irish question, the Franchise bill of 1884-85 and the ecclesiastical politics. It is entertaining even where most exasperating; its sharpness and color will not allow the interest to flag; in fact, there

[1] OMAN'S HISTORY OF ENGLAND. Vol. II. England under the Normans and Angevins, 1066-1272. *By H. W. C. Davis.* New York: G. P. Putnam's Sons. $3.00.

[2] HISTORY OF MODERN ENGLAND. Vol. IV. 1876-1885. *By Herbert W. Paul.* New York: The Macmillan Co. $2.50.

is nothing on modern history comparable to it unless it be Hanotaux's recent work on "Contemporary France."

Mr. McCarthy's last two volumes of the *History of our Own Times*[3] cover a period even more recent than that covered by Mr. Paul, and are by no means so completely political in their character. They contain a very full and satisfactory account of the public events of the last few years of Queen Victoria's reign. Here is a record of the fortunes of political parties, the important legislation, the multitudinous doing in imperial affairs and of the passing of great figures from English history. But this is not all. Mr. McCarthy broadens his scope so as to include a brief but readable retrospect of the important changes which the reign of Queen Victoria saw in the public life, the literature, art and science —more especially the applied science— of the period under consideration. To this he adds striking pen pictures of recent celebrities who have helped to make the literature and politics of this hour.

The new volume of *The Political History of England*[4] is the only one for which two authors are responsible; and in dividing the work the late Dr. Brodrick took upon himself the domestic history of England between 1801 and 1837 and assigned foreign affairs to Mr. Fotheringham. Dr. Brodrick was liberal in the apportionment of pages to his colleague, with the result that the work is uneven in value. Mr. Fotheringham's part is exceedingly well done, and especially is this so of his treatment of the Napoleanic wars, while much of the late Dr. Brodrick's narrative suffers from too great condensation. The years between 1801 and 1837 were the period of reform. Slavery was abolished and the penal code was softened. The House of Commons, the municipalities, the poor law, the law courts, and to some degree the civil service, were all reformed in these thirty-seven years. Adequate treatment of these reforms and of the restoration of rights to Roman Catholics and Non-conformists, which was also accomplished in this period, would demand a volume of as many pages as are here devoted to home and foreign politics and to the Continental wars and American war of 1812. The consequence was that Dr. Brodrick was unable to go into these domestic subjects at the length they demand. He was unable to tell what these reforms meant or to describe with any detail the corruption in English political life for which Parliament found remedies in the period between the death of Pitt and the beginning of the reign of Queen Victoria. It is mainly in this respect that the new volume, serviceable as it is, falls short of meeting the need that has long existed for a history of the last twenty years of the reign of George III and the short reigns of George IV and William IV, which shall be based on the wealth of new material embodied in the political memoirs and biographies which have been published within the last forty years. Working within his limitations Dr. Brodrick achieved success. He was for many years an editorial writer on the *Times*. His journalistic training undoubtedly aided him in his condensation; but in places the narrative is so condensed as to suggest a comparison with the summaries of the year which since 1851 have been regularly published by the *Times*. Dr. Brodrick was twice or three times a Liberal candidate for the House of Commons. But his Liberalism could not have been very robust, judging from the tender fashion in which he handles the Tory measures, the ineptitude of the Tory party, and the leaders of Toryism who were in control in Parliament between the peace after Waterloo and the end of the Tory *régime* in 1830.

[3] History of Our Own Times. Vols. IV and V. *By Justin McCarthy*. New York: Harper & Brothers. $1.40 each.

The Life of Reason

In these days of vaudeville thinking, when most writers do not even attempt to "see life clearly and see it whole," but are satisfied if they can turn a flashlight on a single facet of truth and so bring it momentarily into unnatural prominence, it is a pleasure to find a man who can follow thru five volumes and seven years a consistent, unifying line of

thought. Professor Santayana has surveyed the various fields of human knowledge and experience from a single standpoint, and this gives an especial value to his *Life of Reason*,* but most readers will appreciate more his incidental remarks and apt illustrations than his philosophic framework. This framework, in fact, he never permits to obtrude. His style flows so pleasantly, altho rich laden with metaphor, that one has to read it more than once to get the full significance of the deeper thought.

Disraeli, when he was asked what was his religion, replied, "All sensible men have the same religion." "What is that religion?" was the next inquiry. "Sensible men never tell," he answered. Professor Santayana has tried to tell what is the religion as well as the general philosophy of all sensible men. Exposed clearly and definitely to criticism as it is in these volumes, it must be admitted that it does not quite satisfy the ordinary ideal of what a system of philosophy should be. It is too reasonable, too sane and practical, and we are used to thinking that ethics and metaphysics and science can be true only when they lead us logically into unreasonable extremes, and can be consistent only when they point to impracticable conduct. Professor Santayana's method, therefore, strikes one as being suspiciously convenient. He holds logic in leash. He allows Reason to gambol gracefully about, but always kept close to himself and not allowed to run into dangerous by-paths. It is philosophic opportunism. This always tends toward a justification of the existent. Whatever is, is right, in art, morals and society. Also, whatever has been. It is the theory of the survival of the fittest applied to ideas, and this is apt to lead one to believe that whatever survives is fittest.

George Santayana, Author of "The Life of Reason." Scribners.

Gibbon said of the state of thought in the later Roman empire that to the populace all religions were equally true, to the philosopher they all were equally false, and to the statesman they all were equally useful. Professor Santayana combines in his pragmatic philosophy the points of view of the people, the philosopher and the statesman. All the ideas that prevail now or have been current in the past are partially true and partially false and more or less useful. No doubt he is right in this, and we should say that, in general, he is correct in pointing out what is true and false in them and wherein they have been useful, but his system appears at a disadvantage compared with those of more dogmatic philosophers. In the twilight of his toleration, all cats look gray, while to Ruskin, Carlyle and Nietzsche all cats are either white or black — mostly the latter. But these he calls the "philosophies that are mere vents for cerebral humors."

As we have recently explained in editorial discussions of the new discoveries in physics, modern science tests its theories solely by their utility, not by their beauty, as did the Greeks, or by their logical simplicity, as did the schoolmen. In applying the same method to other fields, the pragmatic philosophers are working along the most profitable lines of modern thought, but their task is a more difficult one. The question is, how many people are there who can recognize the

fact that their ideals are partial, temporary and essentially unrealizable, and yet appreciate their practical value and retain enough faith in them to be stimulated to effective work? As our author puts it:

"Civilization has to work algebraically, with symbols for known and unknown quantities, which only in the end resume their concrete values."

But such ethical and political algebra is beyond the capacity of most people, and they will not be content to have philosophers do their higher mathematics for them.

Professor Santayana thus defines "the religion of all sensible men:

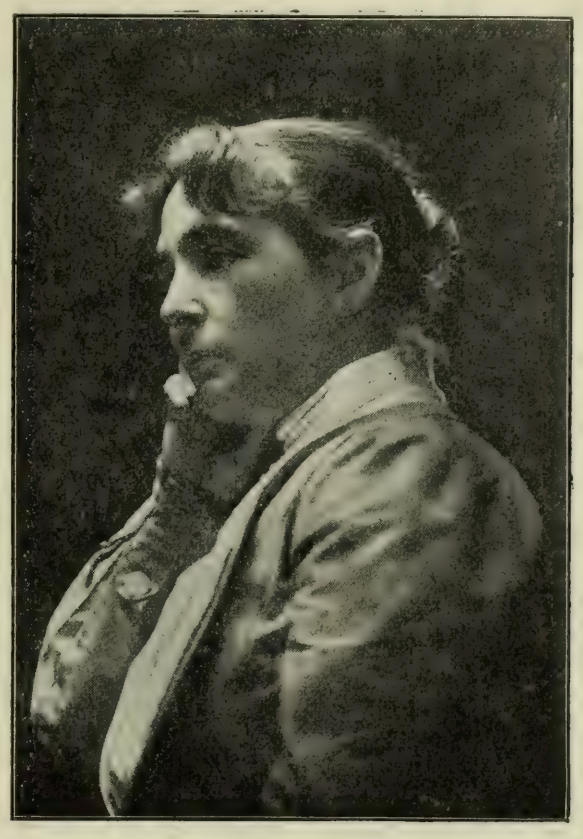
"Rational religion has these two phases: piety, or loyalty to necessary conditions, and spirituality, or devotion to ideal ends. . . . Piety drinks at the deep elemental sources of power and order: it studies nature, honors the past, appropriates and continues its mission. Spirituality uses the strength thus acquired, remodeling all it receives, and looking to the future and the ideal. True religion is entirely human and political as was that of the ancient Hebrews, Romans and Greeks. Supernatural machinery is either symbolic of natural conditions and moral aims or it is worthless."

The volume on *Reason in Art* contains some sharp and witty criticism of popular fallacies; for example, this on historic consistency in architecture:

"Nothing is more pitiable than the attempts people make, who think they have an exquisite sensibility, to live in a house all of one period. The connoisseur, like an uncritical philosopher, boasts of having patched his dwelling perfectly together, but he has forgotten himself, its egregious inhabitant. . . . Ridiculous himself in such a setting, he makes it ridiculous, too, by his esthetic pose and appreciations; for the objects he has collected or reproduced were once used and prized in all honesty, when life and inevitable tradition had brought them forth, while now they are studied and exhibited, relics of a dead past and evidence of a dead present. . . . An artist may visit a museum, but only a pedant can live there."

Strange to say, the volume devoted to science, which should be the crown of the whole *Life of Reason,** is the least satisfactory of the five; not so much from fault of what it contains as from the sense of missed opportunities. In the history of science, in showing the way the false or imperfect theories of the past have led to the discovery of new truth and their own overthrow, Professor Santayana's theory of the method of human progress would have found its finest examples and best verification. Yet he scarcely touches on this, and not at all on the interesting and revolutionary conceptions of physical science, such as Ostwald, Poincaré and Langevin are now developing. In fact, his discussion here lacks the concreteness and abundance of pertinent illustration which forms the chief charm of the style of the earlier work. It is perhaps from a feeling of this that he devotes most of the volume to history and ethics, in which he is most at home. Science is just now greatly in need of a philosopher. It has suddenly outgrown all its old clothes and does not know how to make new ones. Art, ethics and religion are getting along very well in their old, patched and made-over vesture, but in the new fields that science is rapidly opening up there is need for Professor Santayana's power of clear thought and expression.

* THE LIFE OF REASON ON THE PHASES OF HUMAN PROGRESS. Vol. I, Introduction and Reason in Commonsense. Vol. II, Reason in Society. Vol. III, Reason in Religion. Vol. IV, Reason in Art. Vol. V, Reason in Science. *By George Santayana.* New York: Charles Scribner's Sons. $1.25 each.



The Awakening of Helena Richie*

WHERE is Old Chester anyhow? Many of Margaret Deland's readers would like to live there and have Willy King for their family physician and Dr. Lavender for a pastor. We all need "awakening" for one reason or another. Out here in the world it is so easy to get dead in trespasses and sins when they are so glibly ascribed to heredity or environment. We want to go back for a spell where people are held morally responsible even when they are tempted, where it is a short sight up from our knees to God, and where it is thrillingly dangerous to look when we have done wrong lest we should see the eyebrows of Heaven knit in a frown. One man can make a place like this, and in Old Chester it is Dr. Lavender. Just as Phillips Brooks was a great preacher who knew how to spread the glory of God in mighty winged sentences, so Dr. Lavender is a great pastor, who has an immortal wisdom in dealing with little

* THE AWAKENING OF HELENA RICHIE. *By Margaret Deland.* New York: Harper Brothers. $1.50.

children, barbed-tongued saints, and common sinners. He has a witty piety which guides him next to every man's heart. And his name deserves to go down with the other great preachers in history.

Meanwhile, since we cannot all come to Old Chester, it would be a grand thing if Margaret Deland could be induced to let the "Stuffed Animal House" to a few of the more notably bad heroines in fiction. These prettily painted sinners who realize so little of their lost condition would fare better than they do along the way of life after an experience like Helena Richie's. Mrs. King, for example, is "not perfect"; she speaks her mind too frankly and flatly, and she enjoys doing her homely duties painfully, but the judgmental eye of such a neighbor would be very stimulating morally to Mrs. Wharton's Lily Bart. That poor girl would not have been obliged to commit suicide in order to escape the devil if she had had Mrs. King to aggravate her and criticise her worldliness. As for Mrs. "Folly," whom Miss Rickert recently pinched up into the patron saint of a baby-farm, one chastening hour in Dr. Lavender's study would have awakened her to the consciousness of being a thrice-fallen woman, unfit to care for any kind of a baby. There is too much honey-juggling of sinners these days in fiction and out of it. Authors and preachers alike are content to get their reprobates into academic relations to God and into a sort of polytechnic practice of virtue. That is why this is a remarkable story. The author has chosen a character and a situation which usually tempts the novelists into that common literary deathtrap of scandal, hysterical remorse and some kind of subtle compromise with righteousness, and she has made it a story of indescribably moral beauty.

Margaret Deland, author of "The Awakening of Helena Richie." Harpers.

Helena Richie is a sort of female Tito, clinging to the idea of happiness with cowardly persistence and to the exclusion of every nobler duty. She marries not for love, but because the man promises her happiness. When he wronged her and failed her at this point she left him for a lover, because, as she told Dr. Lavender long afterwards, she thought that she would be happy with one whom she really loved. Then the long death of the moral sense began, not as it is so often described in neurasthenic fiction, with lively pain and remorse, but easily, unconsciously, numbly as death always comes. So that when this story begins she is a shallow, pretty woman thirty-three years of age, who has taken the "Stuffed Animal House" in Old Chester for the sake of privacy. Some of the best work Margaret Deland has ever done is in the development of Mrs. Richie's character during this period. She goes to church occasionally, but keeps away from Old Chester folk, feeling subconscious that association with them would be a betrayal of their confidence. Yet she looked forward to the visits of her lover without a qualm. She had to see Mrs. King often and hate her hard, incontestable respectability, before she began to long to be married and "like other women."

If she had lived in a crowded city the opportunity for self-comparison would have been less, because people in cities are so close together they must keep shut tight against each other's psycho-

logically marauding instincts, but in Old Chester they live far enough apart to be open books, read aloud in the neighborhood. So Mrs. Richie could not escape translation. The old man, Benjamin Wright, who lived on the top of the hill, left his canaries and temper and poetry, came down, peeped into her eyes and was the first to discover that she was a "bird." Then Sam's Sam found it out and went to his death like a bright-winged moth into the flame. Next Willy King, who had been half-smitten with her loveliness, in the goodness of his heart, innocently wrung the confession from her, and went home to his Martha reconciled to many of her complaining ways. It is impossible to say how much Dr. Lavender suspected when he gave her the little boy David to keep. He is a heavenly-minded strategist, capable of luring a lonely Magdeleine home with the promise of a child to love and it is certain that he did say to Willy King very shrewdly about this time: "I am not trusting David to her, but I am trusting her to him."

And so the child's presence compelled her to choose over again between good and evil. He followed her about like a light in her darkness, pierced her with a thousand questions of God and of the world as new as his own head. He bound her with love, and took away her peace. She yearned over him and longed more and more to be "like other women." At last she is willing to sacrifice every other chance of happiness for this chance of a child's love. But now comes the author's master stroke as an artist. There is a scene in Dr. Lavender's study where the woman is driven back and back, past every sin. and made to tag it by the right name, and to confess herself unworthy of the dear task of caring for David. All this is done by her own awakened conscience. There is no loss of power. It is a great drama of the soul finished with becoming dignity.

The reason why so many novelists leave God out of their stories is because they cannot achieve so much. It is not agnosticism, it is spiritual intuition, often most apparent in those books where there is the most talk about heaven. But readers of this story will see that in Old Chester at least it is still possible to touch the hem of His garment and be healed.

The Oxford English Dictionary. Edited by James A. H. Murray. Vol. VII. Section Ph to Piper. London: Henry Froude. $1.25.

Each new section of Dr. Murray's stupendous undertaking has its own special interest. On account of the complete history of every word and its numerous quotations from each century that it has been in use, the *Oxford* is the most readable of all dictionaries. This section is largely taken up with the Ph words, nearly all derived from Greek words in , which by an ancient blunder became represented in English by Ph as well as F. It is amusing to see how completely this work cuts the ground from under those who are now opposing the rationalizing of English spelling on the ground that the present usage preserves the original form, and to change it would destroy its historic continuity. But Dr. Murray shows that many of these words were originally spelt with an F. For example, in the twelfth and thirteenth centuries *pheasant, philosophy, physic,* and *physician* were spelt "feasant," "filosofie," "fisike" and "fisicien." What is still better, *phthisic,* which has been the *coup de grace* in spelling matches for years, was spelled "tysyk" in the fifteenth century. Most of the *phantom* family have gone over to F, as *fantasy, fantastic, fancy,* but a proposal to put *phantom* with them, where it belongs by all the laws of philology, analogy, etymology and common sense, strikes the minds of pious pedants with horror.

The Woman in the Alcove. By Anna Katherine Green. Indianapolis: The Bobbs-Merrill Co. $1.50

As long as people in general love mystery and a plot that puzzles, so long will the novels of Anna Katherine Green be read avidly. *The Woman in the Alcove* is not equal to "The Leavenworth Case," but it is sufficiently interesting to keep the reader up after his usual bedtime. The murder of a beautiful woman occurs in the first chapter at a very unusual time and place, and the rest of the book is devoted to arous-

ing and unraveling suspicions as to the identity of the murderer. One does not look for character drawing or social analysis in such books, but it requires no small skill to write them as acceptably as does Mrs. Green, who pleases her large constituency well.

Literary Notes

GROVER CLEVELAND'S *Fishing and Sporting Sketches*, which have been a feature of our Vacation Number for several years, are to be issued in book form by the Outing Publishing Company next week.

....The best popular introduction to Fichte's philosophy of pure idealism is found in his *Vocabulary of Man*, and the Open Court Publishing Company, Chicago, has done us a service in publishing a translation of it for 25 cents.

....After being in a state of suspended animation for a period of fifty years, *Putnam's Monthly* will be revived in October. The new *Putnam* will incorporate the *Critic* and will be an American literary magazine of the highest grade.

....The daintily printed and bound edition of *La Tulipe Noire*, by Alexander Dumas, published by Putnams in their Classiques Française series has an introduction by M. Emile Faguet. M. Paul Souday prefaces La Rochefoucauld's *Maximes* in the same series. ($1.00 each in flexible leather.)

....The admirers of "The Dodge Club" have had another of James De Mille's novels resurrected for their benefit, *Cord and Creese*, a story of adventure written in the days when authors were not chary of material and were not afraid of a little blood-letting. More things happen in connection with the Thuggee cord and the Malay creese than a modern author would need for a dozen stories. (Harpers, $1.00.)

....We have received just too late for inclusion in our Educational Number a new series of school physiologies, published by Silver, Burdett & Co., New York. The series consists of three volumes, *A Primer of Health* (30 cents) for the primary and lower grammar grades, *A Healthy Body* (50 cents) for intermediate, and *The Essentials of Health* (84 cents) for higher grades. They are attractively written and reliable. A large amount of space is devoted to alcohol and narcotics.

....The committee of European and American writers who are trying to raise money for the purchase of the house on the Piazza di Spagna where Keats died, and for the care of the graves of Keats and Shelley in Rome, have secured subscriptions of about half of the $21,000 necessary to carry out their project. As the option on the property will expire next January, it is necessary to raise the balance of the money promptly. Subscriptions may be sent to the American secretary, R. U. Johnson, 33 East Seventeenth street, New York.

....John M. Robertson's *Short History of Free Thought, Ancient and Modern*, appears in a second edition in considerably enlarged form. (New York: G. P. Putnam's Sons. Two volumes.) Additions are made especially to the chapter on "Free Thought in the Nineteenth Century," even Mr. Henry James, Col. Thomas Wentworth Higginson and Maxim Gorky coming in for mention. The work is valuable for reference because of its fullness of bibliographical references, but it is marred by the author's extreme bias against all forms of religious faith.

Pebbles

WOE!

OH, Mister Ibsen, fairest bloom
Of Norway's garden (oof!), and pet
Of soulful (bilious) folk, drop gloom
And crack a smile, lest you forget.

HER WATERLOO.

SHE could play on the piano,
Nothing left her in the lurch,
Anything from "Maiden's Prayer"
Down to "Waitin' at the Church."

Waltz or ragtime, march, sonata,
She could rattle in a streak;
She had Paderewski beaten
With her marvelous technique.

Yet there was this fly embedded
In her ointment of renown:
She could play an octave sideways
But she couldn't up and down.

Thus her wondrous finger movement
Useless proved, alas, alack,
When she tried to don a shirtwaist
That was buttoned up the back.
—*New York Sun.*

THE VOICE THAT WAS MUTE.

WHEN Charles P. Norcross, now a well-known Washington correspondent, began his newspaper career he was sent to "cover" one of the courts. His business was to look at the docket and find the facts about any case that seemed to him to warrant him in writing about.

One afternoon he discovered an entry that said one William Burns had been arrested and fined ten dollars for stealing a martingale from James Jones, a neighbor.

He recited these facts in an introductory paragraph, and then went on: "This criminal was justly punished, for the pretty little martingale he stole was the joy and comfort of the wife of James Jones. She kept it in a cage in her parlor, and when, tired with the work of the day, the martingale began to pour forth those strains of melody for which our Pittsburg martingales are famous, she found great pleasure. Such miscreants as this man Burns should not be allowed at large, especially when they descend so low as to steal harmless and melodious martingales."—*Saturday Evening Post.*

Editorials

Politics in New York

NEW YORK contains one-tenth of the population of the United States and casts about one-eighth of the entire popular vote at a national election. On this account, and for other reasons, the political condition of New York at the beginning of a campaign excites much interest beyond the State's boundaries. New York is the home of the great life insurance companies, and the domicile, so to speak, of the powerful financial interests by which those companies were controlled. Here was made that memorable investigation which smirched so many prominent men, among them the State's two Senators and the executive leader of its dominant party. Many things have taken place since New York last elected a Governor. Exposures and prosecutions elsewhere—as well as those at home—have disclosed the offenses of great corporations and of millionaires whose homes are in the State's chief city. It is not surprising that at the beginning of a campaign which is to end with the election of a full list of executive, legislative and judicial candidates, the political situation should be of an unusual and extraordinary character.

Governor Higgins was elected by a plurality of 80,000, while President Roosevelt's plurality on the same day was 175,000. With great difficulty and after much delay, the Governor was induced to move for an investigation of the life insurance companies. His solicitude for the welfare of the Insurance Superintendent did not commend him to the public. Owing to his opposition, there was no investigation of the Banking Department. For this reason he has many foes in Buffalo, where the circumstances attending the failure of the German Bank seemed to demand inquiry. Politicians associated with him have, in that city, been indicted for their connection with municipal frauds that excited much indignation. The Governor's integrity is not questioned by any one, so far as we know, but it is plain that as a candidate for re-election he would not have all the strength that could be desired.

It is to his credit, however, that he does not have the support of the smirched party bosses who, apparently ignorant of the fact that they are politically dead, are striving to take their old positions. One of these is Senator Platt; another is ex-Governor Odell. Both seem to think that their testimony before the insurance committee has been forgotten. Unfortunately for his party, Mr. Odell has been permitted to retain the office of chairman of the Republican State Committee. Mr. Depew remains in seclusion. Mr. Platt and Mr. Odell should also have withdrawn from public view. But they have come into the open, laid aside the enmity that for a time separated them, and joined hands, apparently to oppose such reform influences as the President has approved in his own State. If they have a candidate to succeed Governor Higgins he has not been named.

On the other side of the political fence there is a very curious situation. The Democratic organization is a wreck. Nominally it is in the hands of those who represented Judge Parker in 1904, but there is abundant evidence that it amounts to nothing or is in a state of flux. Altho the condition of the Republican party offers an exceptional opportunity for the attack of a compact and well commanded Opposition, there has been no selection of a leader, no marshaling of forces.

Of this situation Mr. Hearst has taken advantage. The organization of his party, the Independence League, has been pushed thruout the State. Incidentally, he has gathered in a considerable number of delegates for the Democratic convention, which is to be held on September 25th. Altho his supporters were in a minority at the recent meeting of the State Committee, it was decided that the convention should be held in Buffalo, which is admitted to be one of his strongholds. Afterward, the League's committee made arrangements to nominate him for Governor at a convention to be held on September 11th. The most interesting question in New York politics now is this: Will the regular Democratic convention make Mr. Hearst its candidate? If the Democrats should reject

him, the Republicans might nominate a weak candidate, and rely upon a divided Democracy. For it is understood that Mr. Hearst will seek the office as the nominee of his League if he fails to be nominated also by the Democratic party.

Expert investigators who have gone thru the State agree in saying that there is a very noticeable desire on the part of Democrats and of independents—of whom there are always many in New York—to punish the smirched bosses who have been exposed, together with all public officers who have protected them or sought to do so; also, that many of these angry men, while preferring a candidate like District-Attorney Jerome or Mr. Adam, the reform Mayor of Buffalo, would accept Mr. Hearst, if it should appear that with him they could accomplish their purpose. Mr. Hearst's strength at present is found mainly among the workingmen.

It is predicted that Mr. Hearst will be nominated by the Democrats if the Tammany delegates vote for him. These delegates, it is expected, will follow Mr. Murphy, who succeeded Boss Croker in the control of the Tammany organization, and is not in sympathy with Mayor McClellan. There are some indications that Mr. Murphy will give Mr. Hearst his support.

If Mr. Hearst should be nominated by the Democratic party he would be an opponent whom the Republicans could not afford to despise. Some Democrats would decline to vote for him; in certain contingencies he might have the votes of a considerable number of Republicans. Obviously, it should be the policy of the Republicans to drive into the background the Platts and Odells and other discredited leaders of their kind, and to nominate a man who enjoys the confidence of the people as an advocate of those reforms for which recent investigations have sharpened the public appetite. At the present time the desired qualifications can be seen most clearly in the character and achievements of Mr. Hughes, who conducted the insurance investigation as counsel for the Armstrong Committee. It will be very dangerous to nominate any one who does not represent distinctly a protest against that kind of government at Albany which made the insurance offenses possible, and against the participation of Senators and other public officers in those offenses. Mr. Hughes would bring to the polls with Republican ballots in their hands thousands who would never vote for Governor Higgins. Mr. Hearst, to a good many, represents a protest even broader than that for which, up to the present time, Mr. Hughes stands before the public, but the latter would appeal more forcibly to a large class of independent voters.

This campaign and this election in New York may indicate in some measure the course of politics in the following two years and even the result of the election in 1908. Issues that are local and at the same time national will be involved. By neither of the two great parties can the management of the campaign safely be intrusted to old hacks and bosses who only excite disgust.

Secretary Root's Errand

THERE are two main reasons for a certain suspicion of the United States by the South American republics. One is the mere fact of our pre-eminence and the other is our difference in language. There might be another reason in the case of the other North American republics, for this country has been at war with weaker Mexico, and has taken possession of a very large part of its territory. We have also taken possession of the line of the proposed Isthmian Canal, and have taken Porto Rico and dickered for Santo Domingo and the Danish Islands. It is perfectly understood that we would not refuse an opportunity to incorporate the whole of North America in one republic. And yet Mexico does not fear us any longer. Mexico knows perfectly well that we would not seek any excuse to weaken her further. It is our good will that drove out the invaders who set up a European throne. We are on the best of terms with our nearest Southern neighbor.

But we are the strongest of the American nations, and have used the eldest and biggest brother's right and duty to protect the younger and weaker with our Monroe Doctrine. That arouses some

jealousy and some fear. People do not always like to be patronized. In countries of many revolutions, where violence has ruled over constitutional law, there is suspicion of the purposes of one whose easy pre-eminent protection rankles in the breast of pride.

But it is chiefly the difference of language that separates us, usually called difference of race. They are of "Latin," "Spanish," "Portuguese" races; but all that is nothing in fact. We have a plenty of English-speaking people whose physiognomy could not be distinguished from that of these "Latins," who are good enough Americans. Nothing separates people like language. Those who do not talk our language are "barbarians," if they are not "dagoes." The very word barbarian means first one who does not talk Greek. That separated him, made him less than human, deprived him of rights, made him fit to be a slave. Very much so do people nowadays feel toward those with whom they cannot converse any more than they can with wild beasts.

It has been the business of Secretary Root's visit to South America to overcome this prejudice, to dispel this suspicion. His mission has apparently been a great success. He has assured his hearers that the United States has no selfish ambition, none of the predatory purpose of the rapacious eagle. We are peaceful; we want peace and peace only. We wish to meddle in no other country's business, except for its advantage and in accord with its desire. This is the utterest commonplace, but it has seemed surprising and new, so that it has made Mr. Root's visit memorable and most useful.

What the world demands is peace. The great result of this visit and of the Pan-American Congress is to assure peace over half the world. Why should we mix up in the jealousies of the Old World? We have no vast standing armies that stand sullen and threatening, facing each other across invisible boundaries. With absolute unanimity this Pan-American Congress asks that all American nations shall agree to refer all their differences to arbitration, and urges the coming Hague Conference to approve the same agreement. To be sure it is too much to be accomplished at present. Certain strong nations of Europe want to retain the privilege to kill each other's citizens. But let us of the New World take the new and better path of peace. We trust that our Senate may be willing to hear this invitation and the voice of the peoples of the two Americas. What a noble example that will be to the rest of the world!

The Persistence of Occultism

One who turns the pages of the popular magazines or dabbles in the popular novels, can find abundant evidence that multitudes of people, intelligent enough to be interested in live questions of the day, are still wholly unemancipated from belief in things occult and magical. Some of the best story writers seem themselves to be under this bondage. It is indeed a question whether, in any age, the poetic and artistic temperaments ever wholly get free from it. Here, for example, comes Jack London, apostle of radical socialism, with a tale in which the ghost of a departed father, thru the planchette board, warns a young man who courts the spook's daughter, that by unseen influence he will be removed to the realm of shades before he can marry the girl of his choice. And, behold, everything comes true, as the planchette spook predicts; and there the story ends, without a hint of satirical intent and apparently as a chapter of life, to be taken quite seriously. This concession of London's to those that sit in intellectual darkness is by no means an exceptional instance.

That very intelligent anthropologist and historian, Mr. John Payne, in his "History of the New World Called America," defines barbarism as a stage of human culture wherein a people that has so far mastered the arts of industry that on the economic side of life it is at the threshold of civilization, nevertheless continues to cherish the ideas and the sentiments of savagery. This definition would describe equally well a stratum in the population of all the so called enlightened nations. For these nations include representatives of all the grades of culture, from the lowest savagery to the most refined rationality. It is a mistake to suppose that survivals of primitive

man are to be found only in the wilds of Australia and in darkest Africa. We have him with us in the shadow of our universities, and even in the editorial sanctums of our newspapers. Indeed, we sometimes suspect that these latter places are now his favorite haunts.

The men that make the great discoveries and generalizations in science commonly overestimate the eagerness of their fellows to become acquainted with the ripest knowledge. Copernicus, Galileo, Descartes and Laplace have been dead a long time, and it is safe to say that not 1 per cent. of mankind could make the briefest intelligible statement of the chief contributions that those men made to our knowledge of the universe. To a majority of men who own private libraries the name of Charles Darwin stands for nothing but the contentions that man's ancestor was a monkey. A somewhat larger proportion of the "educated classes" possibly are aware that, according to Max Nordau and Professor Lombroso, some human beings besides them that dine at Newport, are now evolving backward into monkeyism. As for the rest, they have no interest whatever in the results of scientific research. If they have broken away from the orthodox religious faiths, in the cheerful belief that they are "advanced thinkers," they eagerly embrace theosophy, Christian Science, East Indian mysticism and "vibro-nebulizing" therapeutics. Let us not imagine that, because modern science has revealed the universe as an intelligible thing to those who have the mental energy to master scientific methods and results, science is therefore to become the creed of the multitude. The last infirmity of irreligious minds is not science but that same old occultism that satisfied the groping spirit of the troglodyte.

Animism and magic are the mental equipment of the savage, in which he lives and moves and has his being; and to this day they are the mental equipment of probably a good deal more than half of so-called civilized men. Some of them glory in it, a few are ashamed of it, more do not know that their minds have really not advanced beyond the culture of the North American Indian or the Fijian. They hang up a horseshoe; they carry a horse-chestnut in their pocket; they avoid thirteen; they take no journey on Friday. The really appalling educational problem of the time is how to reach these multitudes, and to awaken them to some small conception of the meaning of scientific knowledge. It is plain that our schools, with all their apparatus for nature study and laboratory experiment, are not doing this work. On this point the testimony of the advertising spaces in the yellow newspapers, and in the elevated and subway trains, is much more eloquent and convincing than the stately annual reports of the Commissioners of Education. No people which was really educated would be "pay dirt" for such prospectors as some of our most familiar advertisers are, to "work."

Probably, however, we should not be pessimistic. The superstitious and the wonder-workers we shall always have with us, even when, in the good time coming, the poor are no more. But, happily, scientific knowledge, tho it is still the possession of the few, is a more influential factor in human life than it was once. And, while we shall not banish belief in the occult, it is possible that the day will come when the open and shameless confession and pursuit of it will have become "bad form."

More "Comstockery"

Every little while there appears in the daily press, sometimes of New York, and sometimes flowing over the country, a wave of ridicule of Anthony Comstock. He is an officer of the United States Government, whose business it is to prevent the use of the mails to carry indecent matter, tons of pictures unquestionably intended to corrupt youth. He does his work with great energy and general intelligence and usually with the approval of the courts. The most of the objects which he tries to suppress and destroy are so unquestionably and filthily bad that no decent person can complain. Indeed he is one of those scavengers who are necessary in cleansing our morals, just as other scavengers remove other offensive matter. Most of his work is never obtruded upon the public eye, just as nightsoil is carted away when people

are asleep. Equally not a little of the matter that comes before those other moral scavengers who preside over our courts, especially in divorce cases, is too disgusting to be printed. Mr. Comstock thus belongs to that needful class of public officials, including judges, prosecuting attorneys, jurymen, detectives, policemen and street sweepers, whom we require to do much disagreeable work, all for the purification of society. It is all absolutely essential, and some of it is very unpleasant, but all honorable, and somebody must do it. It is a law in some States, written or unwritten that no buzzard shall be killed, because he does this disagreeable work.

Now, all this good work that Mr. Comstock does one never hears him praised for, any more than you hear praise for the vultures that settle on a Parsee House of Silence. But there is a class of people who would not dare to say that no restraint should be put on the circulation of indecency, but who never fail to slur this work, as if it were prurient prudery. And if this officer makes a mistake, or a doubtful arrest, they delight in the chance to attack and ridicule him, and George Bernard Shaw, as the angel of liberty, talks about "Comstockery."

Just now there is a great cry against him because he has seized the June number of *The American Student of Art,* published by the Art Students' League. This League is an excellent school of art, taught by most reputable artists, and it has done much for American art. It does not neglect studies in the nude, and it is some of these undisguisedly frank studies of naked men and women which are the chief attraction of the numbers which have been seized by Mr. Comstock. We had received a copy, and were not pleased to have such studies selected for publication, for we should not like to see them publicly distributed. While it is doubtless necessary to make studies in the nude, a certain degree of fig-leaf decency is even here to be desired, and does not in the least interfere with study of the play of limbs and muscles. There was a time in Greece when in the gymnasium men were naked and were not ashamed, and when art followed custom; but we would arrest such people nowadays; and even children are required to be clothed, as well as older people when they walk from the bathing booths to the beach.

In this case Mr. Comstock was on the edge of his duty. He is attacked because these pictures are no worse than those in medical books. True, except that they are more life-like. But those are in books belonging to specialists, necessary for them, and not open to the public. This defense may, in a measure, apply to these pictures. They are for and by artists, in their work; and the magazine is intended mainly to attract young men and young women who wish to study art. To be sure they are distributed freely, at a small price, to anybody who wants them, and circulars are sent out soliciting miscellaneous subscriptions, yet so much must be said in their favor. The purpose is not lubricity, as in most of Mr. Comstock's seizures; and this is a real defense, altho the pictures are not at all such as would be decent to examine and discuss in a mixt company, nor would they be exposed even in a picture gallery. They are mere immature studies, with no idealism, just realistic pictures. of nakedness and not works of art. They might not offend a student of art, scarce any more than a naked corpse offends a student of anatomy, taken from the brine in a medical school; but they would be evil if given to one who evil thinks; and no ordinary decent person would like to have them about.

We presume Mr. Comstock will fail in his attempt to prevent the distribution of this number of the magazine. The popular voice of the press is against him, and the press influences judge and jury more than we wish. It condemned Dreyfus, just as public favor has many a time acquitted those who ought to be condemned. The admirers of Whitman are numerous, who are more appreciative of his grossness than of his "My Captain." It is literary form to ridicule Puritanism; and "society plays" and "society novels" illustrate and exploit pornography; and art comes down to repulsive, coarse nakedness, level to the walls of a barroom. If in this act of his Mr. Comstock is judged to have played the prude, it is an error that leans to virtue's side.

In a Hammock

A COUNTRY home should have abundant provision for hammocks. These not only for the use of the family, but for wayfarers and travelers. Near the street swing up, in shady nooks, a few old-fashioned hemp-woven hammocks, that will outlast several years of rain—only storing them during the winters. It is in this sort of sociability and neighborliness that we fall behind the Orientals. But the change is coming over us. It will soon get about that a tired pedestrian will find these wayside couches, or may sit down in a stone arbor, or may eat his lunch in a rustic wayside caravansery. The trolleys are bringing the people out of the cities nowadays and scattering them all over the country. A new beneficence is in order—to welcome these outcomers to a fresh, free life. The new suburbanism should have for its symbol not the hoe alone, but also the hammock.

We are overworked folk — unnecessarily—because we do not know how to take things naturally. Nature never entirely stops working, yet she never gets tired. She has her Sunday, more or less of it, every day. Her Sabbath begins when she is tired, and that is every night and every noontide. If we would live naturally—that is, lie down with the kine and close our eyes with the birds, we should recreate ourselves as fast as we wear out. A hearty meal also, taken at noon, demands at least a half-hour's nap. In fact, our whole method of doing business, in city and in country, indoors and out of doors, should be readjusted. Hurry is a blunder; it is almost never needed, and it is surely hurtful.

Our friends in a hammock multiply rapidly. A chipmunk has a nest in a rockery near by our favorite resting place, and has learned our harmlessness; while we always have crackers and peanuts for his exploitation. He is a likely little fellow, living on weed seeds and the crumbs that are thrown about his doorway. So far as we have discovered, he never imitates the red squirrel, by destroying birds' eggs and young birds. A catbird has her nest in the density of the evergreen foliage overhead. The nest seems to be without occupants, but it evidently still seems homelike to her. She drops down occasionally to talk with us, preening her feathers almost within reach of our hands. She will eat an apple stuck on a spike or laid on the table near by the hammock. These birds love conversation, and can express sentiment nearly as well as human beings. Our collie lies on the spruce needles, making short excursions about the lawn. Quite as interesting is a nest of white-faced hornets, the paper makers—a marvelous little folk. Professor Kellogg, in his new book on insects, says that if this were not the age of human beings it would be the age of insects. They are our close rivals in architecture and in general occupancy and use of the world. It would be difficult to prove that they would not use the world as wisely as it is now used.

But the vegetable world about us is quite as varied and stimulating as the animal. These needle-bearing trees, that rise over our head forty or fifty feet into the sky, have spread a most luxurious carpet of discarded needles, and if the hammock should break loose it would drop us in perfect safety. At one corner of the living arbor clumps of mushrooms have pushed their way thru, just around the roots of a Norway spruce. We shall pull them for dinner, seething them finely in the cream of those Jerseys, whom we see thru the vista of the parting limbs. The shade is just right for these vegetable beefsteaks, and they certainly cost less than those from the butchers' cart. They were probably sown here by the birds, or possibly blown in by the wind. There is no mushroom superior to those old-fashioned puff-balls, as we used to call them. Pepperidge bushes, currants, dogwoods, barberries, raspberries and bush honeysuckles, with high bush cranberries, and miniature trees of mountain ash are crowded together, under the borders and the outreaching limbs of our nook. It is a curious study, these garden and forests planted ahead of time. They are waiting for the axe of some blunderer to cut down the trees, under which they are sheltered, when they will rush up and elbow each other for sunlight and room.

Sometimes we get out of our hammock, lie on the dry needles and count the varieties of plants within reach. They

go well up into the hundreds. Some of them we call weeds, but modern science is gradually discovering the value of every one of them.

There is a fine literature, both old and new, that specifically belongs to the hammock. It fits in with thoughts of rest, recuperation and sunshine. A good deal of modern science is made up of delightfully readable books. "Wasps, Social and Solitary," by Mr. and Mrs. Peckham, is deliciously restful, a sort of halfway house between work and play. But we do not know another book quite so adjusted to hammock life as Professor Hodges's "Nature Study and Life." You can lie on your back and enjoy such books, at the same time getting an inspiration for a richer activity. Another of our hammock books has been "Jörn Uhl"—one of the most perfect novels since "Lorna Doone,' and we shall soon read it over again. Cicero's "Amicitia" and "Senectute" should be in a handy translation for everybody's everyday use; and along with it the "Thoughts of Marcus Antoninus." We are not sure that Thoreau, notwithstanding his love of nature, is a good hammock friend. It is a curious fact that we have in American literature few writers so strenuous and stimulating as Thoreau. Perhaps his "Maine Woods" might do. Among our writers of excursions and describers of Nature we place Frank Bolles decidedly at the head. He does not content himself with a lingo of what he happened to feel, but, with descriptions equal to John Muir, he gives us the real wine of what he has seen and heard. Where have we anything finer than "The Land of the Lingering Snow" or "Chocoruas Tenants"?

Reading we readily drop off into sleep —the real sincere, recreative sleep of boyhood. This is a luxury that too many people lose before they reach mid age, and do not discover how to regain. The hammock will teach you how to sleep. If it is a good summer day there is no need of covering. Pure air was not intended to damage the human body. Let it fold us in, while the slight breeze swings the hammock. All this is an incentive to health; trees, bees, birds, butterflies and books. Yet the hammock is not the whole of it. The recreation that it gives is good for something, only that it is preparative for work. Grand is the sensation with which one shakes himself after one of these legitimate sleeps, and feels driven to go forth to hearty and honest achievements. Let the hammock become an American institution.

The Attack on Governor Ide

It looks as if Archbishop Harty, of Manila, were aching for a fight with the Philippine Commission. That letter which he has written to Governor Ide is discourteous, if not truculent. He begins by excusing and accusing the military authorities who, at first, in their ignorance, had "acted precipitately" and seized valuable ecclesiastical property under the patronage of the Spanish Government, "knowing nothing and apparently caring as little about" the real ownership, because "neither properly informed nor advised as to the rights of the United States and the real owners." Thus he "exonerates" the military officers, but not the Commission when it brings suit to determine in the courts the true ownership of certain estates. "Do you wish," says he, "to enrich the Government at the expense of the Church?" He says he has been "exercising marked forbearance"; that he was silent when the "Aglipay party and the petty municipal governments" "robbed us of church property"; when the Bureau of Education introduced school books "which taught the Filipinos that their ancestors were monkeys"; but when this property is brought to court he will endure it no more. He will defend his right in the court when summoned; but before going he will denounce the outrage in 225 pulpits of the Islands as an attempt by the Government at confiscation. That protest, he says, will go thru the Islands, will go to the White House and to the American people. He has, he says, hitherto supported the American Government, but now "I must bow my head in shame" before an act which "has no parallel in the annals of the United States"; and he concludes his threatening letter with these words:

"This step has not yet been taken. Time yet remains to recall the order. It is wisdom sometimes to change our minds."

It is easy to imagine that Governor Ide was astonished to receive such an imperious communication. He replied, expressing his extreme surprise, calling attention to the plain threat, and reminded the Archbishop that the action taken in this case was of the formal character, necessary and long agreed upon, that the ownership of all disputed property should be settled in the courts, and that this was a case just like the others. He then gave the Archbishop the opportunity to withdraw his letter, so that it might not go on the records, but Archbishop Harty refused, and the correspondence is now published in the Philippine papers, and not at all to the credit of the Archbishop. It was an amazing piece of impertinent dictation. He ought not to have objected to the decision of the courts. We cannot believe that he thinks he can take this high-handed attitude because Governor Ide is to be succeeded so soon by a Catholic, General Smith, for he has been on no very friendly terms with the latter; and the Church has generally got better treatment from Protestants than from its own communicants. The Archbishop has simply made a spectacle of himself to the people.

Bubbles

One of the chief comforts of this summer season is carbonic acid gas. This gas has an especial antipathy to heat. We take advantage of this idiosyncrasy and use it for refrigeration so intense as to freeze quicksilver. We put out flames by deluging them with soda-water, and alleviate our own internal heat by deluging our stomachs with the same liquid. American men, women and children, especially the latter, drink gallons of it every summer, and other nations are catching the habit from us, very much to the detriment of the revenue they derive from the tax on alcoholic liquors. This expansion of carbonic acid gas threatens to burst the budgets of all Europe. It is the chief enemy of that very fiery article, alcohol. But, fearing defeat, King Alcohol has recently allied himself with his foe, and, in the high-ball, whiskey has gained a new popularity.

Curiously enough, the rival beverages, beer and soda-water, have the same source—the brewery. The carbonic acid gas which used to be allowed to escape from the fermentation vats as a useless by-product is now caught and compressed to a liquid, and forms the chief supply of the soda fountain. The starch in grain is split by the yeast plant into two parts—alcohol and carbonic acid gas. The brewer has two hands and serves one product to the hard drinker and the other to the soft drinker. Thus the teetotaler and the tippler support the same industry. Both animals are parasites of the *Saccharomycetes cerevisiae*. Let us hope that in time the carbonic acid will become the main product and alcohol the by-product of the brewery to be thrown away; or, better, used to run automobiles. In the meantime the temperance orator will have to stop talking about the harmfulness of all "products of decomposition" or else eschew soda-water and likewise yeast bread.

Soda-water does not contain soda any more than lead pencils contain lead. It consists essentially of carbon dioxid dissolved in water, where it forms in part carbonic acid, as is shown by the weakly sour taste of "plain soda." With various salts and the flavoring substances it makes mineral waters and all other aërated beverages. The first soda-water was a natural product. It comes bubbling from the ground in many places—in Vichy and Karlsbad, in Saratoga and Manitou, which consequently became health resorts. In order to extend the use of the waters, it became customary to bottle them. The escaping spirit that troubled the waters of the spring was caught and again imprisoned. But it was found cheaper to make any given mineral water artificially where it was used by dissolving in distilled water the salts which chemical analysis showed it contained and "charging" it with carbonic acid gas; that is, forcing the gas in by pressure. The greater the pressure the more gas would be dissolved in a given quantity of water. Under ordinary conditions a pint of water will hold about a pint of the gas. Making the pressure four times as great, it will dissolve four pints. If you will call this fact "Henry's Law" you will have a

higher appreciation of the value of the information. The reason why soda-water is so nice is because you get more for your money than you think you are getting. You pay a nickel for a pint and you get five pints of fluid—only a cent a pint. It is consequently very filling and satisfying to the thirsty soul, who, like all human beings, wants so much more than he can hold.

The imprisoned gas, when the pressure is removed by the pulling of a cork or the running from the fountain, tries to escape and it is very interesting to watch its struggles in your glass as it stands on the table. The gas that is dissolved in the water at the surface can go right off into the air, but that which is down deeper has a harder time. The little individual bubbles clinging to the side and bottom are too weak individually to push their way thru the water to the top. Then the era of merger begins. Several little bubbles join together and form a syndicate. This draws to it all the little bubbles near it and absorbs them. Some of the bubbles you will see trying to preserve a quasi-independence as they cling together, but the filmy partition finally breaks. The trust is formed and soars upward, growing as it goes. There are two reasons why it gets bigger as it rises thru the water; one is that the pressure gets less, as with a balloon in the air, and the other is that the gas in the water thru which it passes can escape into it as easily as from the surface above.

"Unto him that hath shall be given" is also a physical law. As the bubble gets bigger the pressure holding it in gets weaker, just as when you blow up a circus balloon or one of those inflating squawkers that the children have. You have to blow hard at first, but as the rubber film expands it becomes weaker and you have to look out or you will burst it with your breath. Now the bubble of gas in the water is held together by just such an elastic film. You used to call this force "capillary attraction," but you must say surface tension nowadays or your children will laugh at you.

As the bubble gets bigger then the surface tension gets weaker, because it is less arched. It is a poor rule that will not work both ways. All scientific laws should be good rules. Conversely, then, let us say, that the smaller the bubble the greater the force necessary to expand it. That is all right for a ways, but if you work it back mathematically to its extreme limit you will reach the absurd conclusion that no bubble can have ever begin. Or to put it in another way, if the bubble is next to nothing in size it will be next to impossible to start it. The scientists, however, are not at all embarrassed by such a *reductio ad absurdum*. If a law does not go their way they part company with it without a pang. In this case they simply say the rule does not apply to very infinitesimal bubbles, which is obviously true.

But you can see for yourself that, even if it is not impossible, it is very difficult for a bubble to get a start in life. The bubbles begin on the sides and bottom of the glass where there is some little irregularity in the surface to give them a chance. If there is a little scratch made by careless scouring of the glass you will find them lined up along that. A glass with a perfectly smooth, even surface will retain the gas much longer. Champagne glasses have a deep, hollow stem from which the bubbles stream up for a long time, so the liquor will keep "alive" longer.

If you don't want the big trust bubbles to rise to the top and escape, say to Europe, with their accumulations, thicken the water with some sugar syrup from the other faucet of the fountain, and then the bubbles will accumulate on top in a rosy mass of foam and froth, very pretty, but not good for anything.

But this philosophizing makes one thirsty. Our soda water is getting stale from standing. All the life is going into the foam. Blow it off and drink.

Panics

The mad panic which seizes a crowd of Latin passengers in an accident was illustrated in the horrible catastrophe that befell the immigrant steamer "Sirio" last Saturday afternoon in plain daylight and in a calm sea, thru the error of the captain in venturing too near the coast. The vessel sank, and over three hundred were killed, but fewer by being drowned than by the murderous terror of the Italian passengers. They trod on each other; they slashed each other with knives to reach

the boats; they threw people out of the boats to take their places; and one of the passengers seized the life-belt from the Bishop of Sao Paulo, who was returning from the visit to the Pope to his Brazilian see, and the good bishop died giving his blessing to the wounded and drowning victims. In this case the passengers utterly overpowered the crew, who seem to have failed of their duty. Even in this country, in the case of a theater fire, we have had scenes nearly as bad, men rushing wildly over men and women crowded on the stairs. Yet on other occasions, with a class of passengers accustomed to self-control, there has been absolute quiet and discipline, such as we teach children in the fire-drill at school. In such an accident the safest way is to keep one's nerve, to care for others, and to remain as far away as possible from the congested crush of wildly struggling people. One can almost excuse the desire of the captain to drown, for it was not the "fatal and perfidious bark, built in the eclipse" that cost so many lives, but the captain's reckless desire to make speed and cut corners.

A Saving of Thought

There is a certain convenience in having one's thinking done for him. It saves the exhaustion of nerve fiber. Two men, acting officially for a commission, and under full authority, have just published, in Latin, a decision as to what men may think on certain questions purely literary; that is, as to the authorship and composition of certain books. To be sure, those books are the so-called Books of Moses, but no religious question is involved, any more than in the authorship of Æsop's Fables. These two gentlemen, Fulcranus Vigouroux, P. S. S., and P. Laurentius Janssens, O. S. B., decide for us first, that the arguments against the Mosaic authorship of the Pentateuch are not conclusive. Next, they decide for us that Moses, as principal and inspired author, might have used and incorporated previously existing material, or he might have used amanuenses who added and omitted nothing; and even certain inspired additions or glosses might have been added after his death, or old words translated; also that it is allowable to investigate and correct the blunders of later copyists. For this last privilege all thanks. But we can assure these two learned gentlemen and the whole kindly commission behind them, that thought-saving is not to our liking; that scholars will toss their doddering permission and restrictions alike into the Rhine, the Seine, the Thames and the Mississippi, and, we think, into the Tiber, and will go on studying evidence, and flout all their authority.

Patent Office Delays

If there is not much loss in the sale, distribution by gift or destruction of thousands of the earlier models which lumber the Patent Office, yet it seems a pity that they could not be somewhere preserved under lock and key. But the delay in issuing new patents is a much more serious matter, and is explained in an interview by Assistant Commissioner Edward B. Moore. It seems that out of 210 examiners at the beginning of the year, 51 have resigned because they can get better pay outside as soon as they have learned their duties. One big electric company employs in its law branch 15 men, every one of whom it has taken from the examining force of the Patent Office. So rapidly do they go that the Civil Service Commission cannot keep the ranks filled with competent men. It is clear, as Mr. Moore says, that Congress ought to provide better remuneration for this specially skilled work, which is months behind hand, to the injury of inventors and manufacturers.

Republicans of Alabama

There is a little sign that the Republicans are waking up in Alabama. They have called not a convention, but a primary election for all State officers to be held in September, and a weekly paper, *The Southern American*, has been started in Alexander City to represent them. We are interested to see who are invited to take part in this primary, for we recall that Democratic primaries in Texas have been declared within their legitimate rights in excluding negroes and Mexicans. We read in the call that "all persons who are qualified electors," without regard to past political affiliations, who

believe in the principles of the Republican Party as administered and maintained by President Roosevelt," are invited to take part. Yet when we observe that the Chairman of the Republican Committee is the son of a Confederate soldier, one might suspect that the call was meant only for "lily whites," until he reads further in this new paper that rich and poor, great and humble, have equal rights as citizens; and a long article by Joseph C. Manning is devoted to showing that giving the ballot to the negro only carried out the principles of the Declaration of Independence, and that "the bold assaults upon the suffrage rights of the blacks" has had a double result, for the result is that "the right of suffrage is being subterfuged away from thousands of whites, as well as from practically all the blacks." A strong and honest Republican movement in the South ought to invite and expect the equal support of all men without respect to race.

Chedorlaomer

There is a curious history attached to the attempt to find a record in the Babylonian inscriptions of the "Chedorlaomer, king of Elam; Tidal, king of Goiim; Amraphel, king of Shinar, and Arioch, king of Ellasar," whose raid in Palestine in the time of Abraham is told in the fourteenth chapter of Genesis. For many years the name of Eriaku has been identified with that of Arioch, and it has been believed that Amraphel is the famous Hammurabi. But altho Kudur-mabug and Kudur-nakhunti, kings of Elam, were known, and altho it was known that the name *Chedorlaomer* was properly formed and in Elamite would be *Kudur-Lagamar,* Worshiper of the god Lagamar, it was not until eleven years ago that Dr. Pinches announced that he had discovered this king's name on a late Persian tablet. But the reading was much doubted. A few years ago Père Scheil, who first translated the code of Hammurabi, announced another discovery of the names of Chedorlaomer and Tidal, but this was also opposed and discredited, so that when Père Scheil was nominated by the scholars as Professor of Assyriology in the University of Paris he was turned down by the Minister of Education, really because he is a Catholic priest, but ostensibly because of his blunder about Hammurabi. Now Professor Sayce, in a late paper, opens the subject, and declares that recent discovery proves that Dr. Pinches was right in his reading of the name of this king of Elam. He says the text, which is of the period following the destruction of Babylon by Cyrus, and so quite late, is a poetic trilogy in which the first part ascribes the conquest of Babylon and the destruction of its temples to the unrepented sins of the people and the anger of Bel-Merodach. In the second part a Messiah is promised, who had been predestined from the "days everlasting," and who should "destroy the wicked ones." It is the third which recalls the destruction which fell on Chedorlaomer and his allies, and concludes that "the sinner shall be rooted out." The poems, says Professor Sayce, are unique in Babylonian literature in mentioning "the Accuser," who plays the part of Satan in Job, and in using the plural "gods" as singular, as in Hebrew. It seems that Tidal, king of Goiim, or Nations, was king of the people called the Randa, and it was by his help that Chedorlaomer conquered Babylonia. This conquest took place when Hammurabi (Amraphel) was still a boy, and it lasted for thirty years, when Hammurabi drove out the invaders. The mother of Eriaku (Arioch) was the sister of the Elamite king.

Interdenominational Colleges

In China the various denominational missions are uniting in founding Christian colleges in which all denominations will have part and right; and why not in this country? As it is the West that takes the lead in progressive movements nowadays, it is not strange that Southern California, which is nearest to China, should be the first in this country to attempt to imitate the Chinese example. Pomona College is at Claremont, Cal., and Dr. George A. Gates is its president. He is known for his great success in developing Iowa College before the social escapade of Professor Herron and President Gates's

fight against the school publishers' trust made a revolution there. The college has an endowment of nearly $300,000 and good buildings, all secured by the Congregationalists, who are in its control. It is now proposed that the Baptists and Disciples, who have no college in Southern California, shall unite with the Congregationalists in the support and control of Pomona College, with any other denominations that will join, thus making it an interdenominational, or, better still, an undenominational college, which will be strong enough to command the situation in all the Californian Southland. It is a noble plan, and has so great favor with the three bodies that it is likely to be accomplished. It offers a suggestion to other States in which there are too many rival denominational institutions. They may well consider the matter before they are too firmly settled in a permanent weakness. President Gates and his associates may have got hold of a great idea. It is well for a State to have a strong Christian college by the side of its State University, that each may be a spur to the other.

Gradually, by the example of those near them, all our States are coming to enact laws to limit child labor in factories. Such a bill has just been passed in Georgia, which provides that under no circumstances shall any child under ten years of age work in factories—certainly a low enough limit. If under twelve he may so work if an orphan or with one or more parents dependent on his labor. No child under fourteen shall work at night between 7 p. m. and 6 a. m.; and no child under fourteen unless able to read simple sentences and write his name, and shall have been in school three months of the year. There is nothing very drastic about these provisions, but they are a good beginning.

The Army and Navy Journal tells us that we need not ask if a Dreyfus case is possible in the United States, for we had two cases in our Civil War—one of Gen. Fitz-John Porter, and the other of Gen. Charles P. Stone. Of the latter officer, who was imprisoned by order of Mr. Stanton, and afterward released without explanation, Mr. Blaine says that a popular mania demanded a victim to atone for a catastrophe. General Porter was found guilty by a court martial, and after deep disgrace, was vindicated by a second court and restored to his position in the army. Of course, these cases were not so tragic as that of Dreyfus, but they were of the same order.

Six negroes, one a woman, charged with murder, taken by a mob from the jail at Salisbury, N. C., tortured with knives, hanged and riddled with bullets, the officials "overpowered"; the militia called out and did nothing, the sheriff "pleaded" with the mob, but did not shoot—they were given only blank cartridges. It is pitiful, it is disgraceful, it is cowardly. The other day, when a mob threatened to take a prisoner in another Southern State, the sheriff lifted his gun and declared that he would shoot the first man who attacked the jail, and the mob melted away. Here the mayor, the sheriff and the militia could not protect the prison.

We all know people who are cross because they are ill; and it is not incredible that a lesion in the throat or the nose or the eye may give occasion to a strabismus in the character. Accordingly it is not beyond hope that, as in the Philadelphia experiments, some unruly boys brought before the children's court may really be morally benefited by surgical care. At any rate, it is a kind of government interference that ought to be extended. No child should be allowed to grow up to be an imperfect man if science can help it.

We need not think that the action of the Leland Stanford (we may drop the "Jr.") University in withdrawing the authority of President Jordan to remove a teacher was meant as any affront to him; doubtless it had his approval. It seems to mean simply that the personal rule of Mrs. Stanford is over with her death; that the orderly course of control has begun, and that there will be no more Ross troubles.

Insurance

Untermeyer vs. Peabody

UNDER date of July 25th, Mr. Samuel Untermeyer, of counsel of the International Policyholders' Committee, addressed a note to the Board of Trustees of the Mutual Life Insurance Company, in which it was alleged that unsuccessful attempts on the part of the writer to secure the coöperation of the Mutual looking towards getting into communication with the Mutual's policy-holders, which began on March 20th of this year have continued until the present time. It was claimed that lists of policy-holders prepared under provision of law were defective and that the streets and street addresses in certain cited instances as filed were lacking; that secret stenciled lists were in the company's hands from which campaign literature was being mailed; that the mailing of letters and circulars as well as the stenciling of the mailing lists was done at the expense of the policy-holders and that while the solvency of the company was not now and had not previously been questioned, yet persistent attempts were being made to circumvent the law and prevent the expression of the will of the policy-holders at the coming election. To this Untermeyer letter a scarifying reply was sent by Charles A. Peabody, President of the Mutual, who wrote in part as follows:

NEW YORK, July 27th, 1906.

Samuel Untermeyer, Esq., New York City:

DEAR SIR—The lists of policy-holders of this company that have been filed at Albany contain all the information with respect to the addresses of the policy-holders that was in the possession of the company, and that was furnished the home office by the agents, who made affidavit as to its correctness. Those lists are identical with those filed under the statute in the home office, and are not substantially defective, and you have been misinformed by the statement that a large or any appreciable proportion of the policy-holders will be disfranchised.

I have not denied that the policy-holders' lists, as filed, are being stenciled. I have denied, and it is not true, that a new and different list of policy-holders is being prepared. Stencils are now being made from the list of policy-holders as filed at Albany, with necessary corrections, as changes of address since the filing of the lists have been brought to our attention, but no other or different work is being done with respect to the policy-holders' lists.

No campaign literature has been or will be sent out from these lists at the company's expense.

As the executive officer of the company, I have given and will continue to give them from time to time all the necessary information, and will lay before them the true state of the company.

I see no reason why you should be disturbed by the circumstance that the policy-holders receive correct and accurate information from the home office with respect to the administration of their affairs.

You have voluntarily created a body which you have styled a "policy-holders' committee," of which less than one-third are members of this company. These gentlemen, for reasons which I presume are entirely satisfactory to themselves, permit you to use them for the purpose of giving weight to your reckless and untruthful statements about the officers and trustees of this company. Your efforts are injurious to the best interests of the policy-holders, and are not assisting them to form a correct judgment as to the manner in which the company has recently been conducted. While your right as a policy-holder, and the right of every policy-holder, to information as to the company's affairs is fully recognized, I protest against the position of the members of your committee, who, without committing themselves personally, over their signatures, to your untruthful statements, permit their respectable and undoubted standing to be used to further your attacks upon the prosperity of the company, of which you are a member.

Your letter of July 25th is full of statements that are not true, and of insinuations and innuendos that are not sustained by existing facts.

Your complaints, which you say you have made to the Superintendent of Insurance, of the printing and distributing at the policy-holders' expense, of literature paid for at advertising rates under the guise of news matter, raises an issue that absolutely does not exist. No such literature has been published under the guise of news matter. No advertisements extolling the management, and intended to influence policy-holders to vote for the nominees of the administration at the forthcoming election (which you untruthfully state has been paid for out of the policy-holders' money) have been published. The advertising that has been done by the present management has been of the usual character, giving statistics of the company's business, both to inform the present policy-holders and attract new ones, and at an expense much less than similar advertising has cost in former years. Such advertising is not only desirable but absolutely necessary to the conduct of the business, and made more essential by your constant misrepresentations. If it has the indirect

result of informing the public that the present management has achieved satisfactory results, you, as a policy-holder of the company, should rejoice at this and should sustain the officers and trustees of the company, in place of injuring yourself and your fellow policy-holders by persistent misrepresentation of the existing facts.

On the administration ticket twenty-one out of thirty-six names are those of men who were not on the board of trustees under the past and displaced management. Such change, in itself, is a radical one, and ordinary and conservative business principles require the preservation on the ticket of enough of the old men to give the company the benefit of their experience and knowledge of the business. Such a course is absolutely essential to the prosperity of the company.

The insinuation that "an attempt is being made to circumvent the law and prevent the expression of the will of the policy-holders at the coming election" is absolutely untrue as regards this company, its officers and trustees. You alone are endeavoring to "prevent the expression of the will of the policy-holders at the coming election." This you are endeavoring to bring about by deceiving them thru continued misstatements to the effect that the officers and trustees of this company are using the money of the company to circulate campaign literature, and that there has not been a complete change of management of this company since January 1.

In your statements about this company you ignore and conceal the fact that every one of the present principal officers of the company has come into office since that day, and that twenty-one out of the thirty-six names on the administration ticket are those of new men.

In many of your misleading statements you seem to be unsupported by your committee, and I consider that were its members correctly informed of the facts, as honest men they would repudiate you and censure your conduct. The absurd requests that you make of the board, founded upon misstatements and unfounded assertions, require no detailed treatment. Your cool assurance that you are qualified to speak for the policy-holders of this company to a greater extent than its legal representatives, and your untruthful statement that it is the policy-holders' "declared purpose of securing a radical change in the management," are thoroly characteristic and, I am confident, will finally deceive nobody.

You are seeking to manufacture public opinion against the present management of this company by raising false issues and by accusing the officers and trustees of the company untruthfully of acts which have not been committed. I am confident that you will fail in this design.

Eventually, if the time has not already arrived, I am sure that the public and the policy-holders will give to the officers and trustees of the Mutual Life Insurance Company that confidence and support to which they feel they are entitled. Very truly yours,

CHARLES A. PEABODY, President.

Mr. Untermeyer in reply reiterates his charges against the present management, and declares that under no circumstances will he accept office in the Mutual Company. He also sets forth that he will accept no reward, direct or indirect, for his services. A decision in the fight to compel the removal of the names of four members of the International Policyholders' Committee from the "administration ticket" has not been reached.

THE Continental Insurance Company of New York has issued under date of July 30th, a copy of its statement of losses incurred in the city of San Francisco, made in compliance with the demand of Hon. Henry R. Prewitt, Insurance Commissioner for the State of Kentucky. It appears from this document that the company's gross liability was $2,741,886.94, and its liability less reinsurance was $1,977,230.42. The salvage is estimated at $215,532.23. The claims adjusted and paid are set forth in the statement as being in total, $994,409.95. The company's remaining liability is estimated at $767,288.24. Liability has not been denied upon any claim up to this date, and no amounts have been paid into the company for the purpose of increasing its capital or surplus.

THE North German Fire Insurance Company of Hamburg, one of the "earthquake companies," has decided to withdraw from the Coast. Claims against the North German amount in the aggregate to about $3,000,000. These have not yet been adjusted, altho fully 60 per cent. of them are covered by reinsurance. Under agreements made with the reinsuring companies the policies of the North German will be construed according to the strict letter of their contracts. All the policies involved contain a clause relating to earthquake damage.

THE American Tobacco Company has issued a formal notice to all of its many employees thruout the United States that a death benefit will be paid to the beneficiary of any person in its service whose weekly wage is not more than $50. The maximum benefit derivable under the American Tobacco Company's plan is $500. About 150,000 persons are interested in the scheme.

Financial

Continuing Prosperity

PROOF of the great material prosperity of the country is to be seen in all the current reports and statistics of trade and industry. Grain crops are surpassing even the large yields indicated by the Government's figures at the beginning of July. The safety of spring wheat is assured, and the harvest in Minnesota and the Dakotas is the largest ever known there. Across the boundary, cars enough to carry the great crop in Canada's new wheat fields cannot be obtained. In our own Northwest, the record for the smaller crops of cereals, as well as for wheat, will be broken. More than 600,000,000 bushels of all kinds of grain will be harvested in the three States named above. The latest cotton report points to a crop exceeding last year's by 10 to 15 per cent. At the convention of the International Apple Growers' Association, on the 3d, Mr. Williamson, chairman of the executive committee, declared that the coming crop of apples in this country and Canada promised to be twice as large as last year's and of exceptionally good quality.

We recently spoke of the remarkable increase of railway earnings. The *Financial Chronicle* has since published its returns for the first six months of the calendar year. These (for 182,611 out of a total of about 210,000 miles) show an increase of 14¼ per cent. in gross earnings over those of the corresponding months in 1905, or about $130,000,000. Increase in net earnings has not yet been computed, but the returns for a part of the period indicate a very large advance. Connecticut's Railroad Commission says that the year ending with June was "one of unexampled prosperity" for the railways of that State. These enlarged profits have been accompanied by a reduction of passenger rates, and a considerable reduction is soon to be made on the Eastern lines of the Pennsylvania system.

In the first half of 1906 the output of pig iron rose to 12,602,901 tons, against 11,829,205 in the last half of 1905. Last year's total was a little less than 23,000,000; this year's, in all probability, will exceed 25,000,000. In half a year now we make more than was produced here in any whole year prior to 1899. Net earnings of the Steel Corporation for the quarter ending with June exceeded $40,000,000, against $36,500,000 in the preceding quarter, and only $30,000,000 in the June quarter of last year. Unfilled orders on hand, June 30th, were for 6,809,589 tons. Last year at the corresponding date they were for less than 5,000,000. Because of this prosperity, and of the great crops which promise that it will be continued, this great company announced last week that it had resumed the payment of dividends on its $508,000,000 of common stock, assigning ½ of 1 per cent. to each of the last two quarters. For some time after the beginning of its existence the Corporation paid 4 per cent. on this stock, but until this year nothing has been paid since the end of 1903. Steel, said Mr. Carnegie, is either a prince or a pauper. In these days it is a prince.

....In 1905 about 84,000,000 ties were placed on the railways of the United States. Nearly half of these were of oak.

....The Mohawk Valley Company, the corporation which operates the trolley lines of the Vanderbilt system in the State of New York, has increased its capital stock from $10,000,000 to $20,000,000.

....It is now expected that the substitution of electric force for steam on the New York Central's lines for thirty-five miles beginning at the station in this city will be accomplished by October 15th.

....Our imports of diamonds in the fiscal year 1906 were $34,862,551, against $27,419,000 in 1905, and $18,804,000 in 1904. Uncut stones brought in to be cut here were valued at $10,579,000. For other precious stones (in 1906) there should be added $5,384,459, making a total of $40,247,010.

....Dividends announced:

Niles-Bement-Pond Co., (Preferred; quarterly), 1½%, payable August 15th.

Niles-Bement-Pond Co. (Common; semi-annual), 3%, one-half payable September 20th, one-half payable December 20th.

Pratt & Whitney Co. (preferred; quarterly), 1½%, payable August 15th.

International Salt Co., (quarterly), 1%, payable September 1st.

The Independent

VOL. LXI NEW YORK, THURSDAY, AUGUST 16, 1906 No. 3011

Survey of the World

The Standard Oil Company Indicted

After taking testimony for only three hours and a half, in Chicago, on the 8th, a special Federal Grand Jury indicted the Standard Oil Company for accepting rebates from the Lake Shore and Michigan Southern Railroad Company between August, 1903, and February, 1905. In the indictment there are nineteen counts. If the company should be found guilty on all of them, the court could impose a fine of $380,000. It is understood that the rebates were a remission of the ordinary charges for storage at the railroad warehouses in Chicago. This case was one transferred from Cleveland, where a part of the evidence was recently laid before a Grand Jury, and where it was ascertained that the court for that district had no jurisdiction over the offenses in question. No officer of either the oil company or the railroad company was indicted at Chicago. The Grand Jury, however, has not finished its investigation. It is said that there will be additional indictments. These may relate to conspiracy (under the statute for a violation of which two rebate brokers were sent to prison in Kansas City) and to violations of the Anti-Trust law.——At Jamestown, N. Y., on the 10th, another Federal Grand Jury indicted the Standard Oil Company, the Pennsylvania Railroad Company, and the Vacuum Oil Company, of Rochester, for similar violations of law. In the indictment against the Standard there are twenty-four counts, and in each of the other two indictments there are twenty-three. If the defendants should be found guilty upon all of these charges, the law would permit the imposition of fines amounting to $1,400,000. In this case the offenses alleged to have been committed were the granting, and the acceptance, of unlawful concessions in freight rates in the year 1904, the concession in one instance reducing the published rate of 19 cents per hundred pounds, from Olean, N. Y., to Rutland, Vt., to about 16 cents. The Vacuum Company is said to be one of the Standard's subsidiary corporations.——Six additional indictments (making sixteen in all) were found last week by the Federal Grand Jury that has been investigating the Sugar Trust's rebate transactions with several railroad companies. It is reported that persons, as well as corporations, are accused, but particulars have not yet been given to the public.——It is said, apparently upon the authority of the Government's prosecuting officers, that John D. Rockefeller is not to be indicted in connection with the transactions which grand juries are now considering. Mr. Rockefeller is now in Cleveland. In that city, last week, addressing the Euclid Avenue Baptist Church Sunday school, of which he is superintendent, he said:

"This is a great and good country to live in. It is a powerful country. It has grown to its present strength from the strength of a few Puritan fathers who first settled here. It was this spirit of the Pilgrims, this love of truth, respect for it, the desire for right living, which laid the massive foundation of the United States. The Puritans made the beginning what it was. We should keep it as it was intended. That is why we should love this country of ours; love her people, her business and her institutions. We should sink the smaller annoyances in the greater things; we should remember that the events which seem overwhelming now will be forgotten in a decade. Thru it all we must show our love for our fellowman. We are free in this country. We can

study the Bible, live in the truth and accomplish great ends by our freedom. Over in Europe they do not have the advantages we have. I was surprised to find so few Sunday schools on the Continent. I think they are great institutions. Our country is much better for its Sunday schools. After I have seen what the Continent has in the way of Sunday schools there, I have decided that this is a country of Sunday schools. In living in the United States you have a heritage which is most valuable."

Other Rebate and Trust Questions

Owing to the publication of reports that the railway companies were preparing to attack the new Rate law, and that the Pennsylvania company would lead the movement, that company has published a disclaimer, saying that it is not seeking to contest the validity of the statute either on its own behalf or in association with others. The company asserts that it is making an exhaustive study of the new law, striving to understand clearly the requirements of the statute in order that it may intelligently comply with them. Pointing out that it has for many years opposed rebating, it adds that so far as it understands the purpose of the law it intends to co-operate with the Commission in enforcing this legislation.——Some weeks ago, the rebate case against the Atchison, Topeka & Santa Fé Railroad Company and the Colorado Fuel and Iron Company was tried in New Mexico, and each defendant was fined $15,000. The Commission now publishes a statement, of which the following is a part:

"Too much praise cannot be accorded to Attorney General Moody for carrying this case thru to a successful termination, and that, too, after the adverse criticism, in many journals, of the refusal of the Administration to undertake the prosecution of Paul Morton, then Secretary of the Navy, and formerly head of the traffic department of the Santa Fé system. The Attorney General, in disagreeing with Messrs. Harmon and Judson, who had been employed by the Government to make a preliminary investigation, acted plainly with foreknowledge of the legal difficulties that attended every step in the attempted prosecution of Mr. Morton and other officials in this particular case, which really grew out of a long-standing practice intended primarily to develop the coal industry in Colorado and New Mexico, which really did have that effect, and which only became conspicuously unlawful after the passage of the Elkins law in 1903."

"That there was criminal intent on the part of Mr. Morton," the Commission says, "has always been denied, and the avowed purpose of the practice tends to support that view." That the competitors of the defendant coal company were injured, however, appears in the Commission's remark that "a civil case brought against the Santa Fé by coal-mining companies discriminated against in favor of the Colorado Fuel and Iron Company was settled by the payment of something like a half-million dollars."——The fourteen officers of ice companies who were recently arrested in Philadelphia have been indicted for criminal conspiracy under the common law. In New York, a grand jury, in response to a sharp charge from Judge Rosalsky, has been considering evidence as to the ice business in that city. The Department of Charities and Correction will erect an ice factory, and it expects to supply its needs at a cost of $1.35 per ton.——Secretary Hitchcock, to protect the Indian owners and to prevent monopoly, made a rule that not more than 4,800 acres of oil land in Indian Territory should be leased to one person or corporation, and that bonds must be given to require each lessee to use his lease and not to transfer it to others. These regulations are not liked by some lessees, who ask that they be revoked. Ex-Senator Jones (chairman of the Democratic Committee in the Bryan campaigns) called upon the President in company with his client, T. N. Barnsdale, of Pittsburg, to complain about the Secretary's ruling. Several newspapers say Mr. Barnsdale represents Standard Oil interests; Mr. Jones says that his client denies this. Governor Higgins, of New York, wrote a letter to the President in behalf of Mr. Barnsdale; it was sent to the Secretary, who remarked that Mr. Barnsdale had violated the regulations. There is said to be an attempt to consolidate the lease interests in the Territory, where enormous deposits of oil have been found.

Chinese Labor for the Canal

Announcement was made on the 10th that Chinese labor would be thoroly tested in the Canal Zone, and

that contracts for the employment of 2,500 Chinese had been prepared. Advertisements will soon be published calling for proposals from the agencies that supply Chinese workmen under contract. A decision concerning the use of Chinese was deferred by the President, Secretary Taft and Chairman Shonts until there was conclusive evidence that other available labor would be insufficient. The work is said to be too hard for the West Indian negroes, and only a small number of Spaniards can be obtained. Negroes from Jamaica receive 80 cents a day, and the Spaniards $1.60, for doing more than twice as much work. Immediately after the announcement, a statement was published by Mr. Gompers, president of the Federation of Labor. Those in charge of the canal work, he said, had regard for neither law nor principle; they had annulled the Eight-hour Law on the Isthmus and had ignored the Chinese Exclusion Law. The latter law, he continued, excluded Chinese laborers from possessions of the United States, and the Zone was such a possession. He had been told by Chairman Shonts, he added, that it was not his (the chairman's) intention to employ Chinese labor. Mr. Shonts arrived at New York from the Isthmus on the 11th. The employment of Chinese, he said, would be an experiment. From Spain the Commission was trying to obtain 500 laborers per month. The Eight-hour Law was not applicable to unskilled labor in the Zone; all the laborers of that class were foreigners, for it was impossible to procure a supply from the United States. He denied that the Chinese Exclusion Law was applicable to the Zone; it excluded Chinese laborers from territory subject to the authority of the United States at the time of its enactment, in 1903, but the Zone was acquired afterward. Newspapers discussing the political aspect of the matter assert that the Government has been urged to employ Chinese by ex-Senator Jones, who was chairman of the Democratic National Committee in the two Bryan campaigns, and who is now said to be counsel for Chinese labor agents. ——On the 10th the police of Panama arrested thirteen foreigners, charged with plotting the assassination of President Amador and the overthrow of the republic. Eleven of the prisoners are Colombians, and several of these were prominent as commanders during the revolution of six years ago.

Georgia's Bitter Campaign

This is the last week of the long and bitter campaign in Georgia for the nomination for the office of Governor. On the 22d the primaries will be held, and these will be followed by the Democratic State Convention in September. So far as the leading aspirants are concerned, the campaign has been in progress for more than a year. These candidates are Hoke Smith, ex-Secretary of the Interior and formerly the owner of the Atlanta *Journal,* and Clark Howell, editor of the Atlanta *Constitution* and member of the Democratic National Committee. Other candidates are Colonel Estill, owner and editor of the Savannah *News;* R. B. Russell, formerly a judge of the Superior Court, and Col. James H. Smith, a wealthy farmer. From the beginning the campaign has been one of bitter personalities, and these become very sharp as the end approaches. On the 10th, Albert Howell, a brother of Clark Howell and counsel for the Southern Railroad Company, published a card asserting that Hoke Smith had robbed a client named Dempsey of $1,000 by deceiving him as to the amount recovered in a suit against one of the railroads. Whereupon Mr. Smith said that the assertion was false and invited Howell to swear to the accusation. If Howell would do this, he continued, "I will indict him for false swearing and I will put stripes on his back and shackles around his legs as a common felon in the State penitentiary." In response, Howell's law firm, acting for Dempsey, sued Smith to recover the $1,000 alleged to have been taken fraudulently, and Howell published another card, in which, after saying that the first time he ever heard of Smith "his name was reeking with the slime of so foul a scandal that fond mothers stopped their daughters' ears when his name was uttered," he continued as follows:

"From that to this his name has been the synonym of selfishness, duplicity, hypocrisy, and cowardice. Today he stands branded in the columns of the public press and in private letters by eminent citizens of Georgia, who

have exhausted the range of English adjectives, from razorback to hypocrite and from character assassin to common liar, in their efforts to correctly characterize this swaggering swashbuckler with whom no man's reputation is considered sacred. No pen can paint the pitiful picture of this captious charlatan, who has never in his life been consistent save in the discord he has sown and the ruin he as wrought."

Some think all this must lead to shooting. Smith's platform calls for the disfranchisement of the negro by such laws as have been enacted in several other Southern States. It also demands a revision and a reduction of railway rates by a commission elected by the people.

Conviction of a Lyncher

In North Carolina, the leader of a lynching mob has been convicted and sent to the penitentiary for a term of fifteen years. The lynch law murders were committed at Salisbury, on the 6th. Six negroes were in the jail there, held for murdering Isaac Lyerly (a farmer), his wife and three of their children. These five persons while in bed had been killed with axes, and then their house had been set afire. Two older children escaped. For one day three of the prisoners had been on trial at a special term of court, held in order that there might be no delay. On the night of the 6th, a mob of 2,000 persons broke into the jail, took these three from their cells, and hanged them. Senator Overman and Judge Long, standing at the jail entrance, pleaded with the lynchers in vain. The local company of militia was on guard, but did not interfere, having only blank cartridges and receiving no orders to shoot. Governor Glenn denounced the lynching as a blot on the history of the State and sent two companies of militia to Salisbury. Judge Long charged the grand jury that any man who had taken part in the lynching, or who had encouraged the lynchers "by word or presence," was guilty of murder in the first degree. Five of the lynchers were arrested. One of these, George B. Hall, having been indicted, was placed on trial for conspiracy. After deliberating only thirty-five minutes the jury found him guilty, and he was promptly sentenced to be imprisoned for fifteen years, this being the greatest penalty provided by the law. On the following day (the 11th) F. M. Cress was arraigned for trial. His attorneys produced two physicians who testified that he was insane when he joined the mob. Therefore he escaped trial and was released on a small bond. Hall (an ex-convict) is the first man to be convicted in North Carolina for taking part in a lynch-law murder.

Japanese Poachers Killed

It became known in Washington on the 8th that on July 16th and 17th a raid upon the seal rookeries on St. Paul Island, off the coast of Alaska, was repulsed by agents of the Department of Commerce and Labor. The raiders were Japanese. Five of them were killed and twelve captured. These prisoners will be tried by the United States court at Valdez. It is said that for some time eight or ten foreign schooners had been near the island. On the first day of the raid, six Japanese who had landed were caught; on the second, in the morning, two members of a landing party were killed and one was wounded and detained; in the evening, favored by a dense fog, the crews of three schooners came ashore and were not discovered until they had taken 200 seals. Three poachers were killed and five captured, but a majority of this party got away. The official report has been sent to Ambassador Wright, at Tokio, for the information of the Japanese Government. Our Government may express regret, but will offer no apology. There is no indication that our harmonious relations with Japan will be disturbed by the incident.

The Philippine Islands

The Pulajanes of Leyte appear to be more formidable than those of Samar. On the 5th they attacked Abuygo, twenty miles south of Buraen, killed an ex-mayor, three policemen and two other residents, and burned the town hall with all its records. On the 9th, at Julita, a suburb of Buraen, a small detachment of troops was ambushed by them, and a fierce hand-to-hand fight ensued. Lieutenant John F. James, of Virginia; Privates Gilleck and Zeck, of

Company F, Eighth Infantry; Contract Surgeon Calvin D. Snyder, of Baltimore, and Internal Revenue Collector Williams, of Illinois, were killed. Governor Ide and General Wood have gone to the island to make an investigation.—— Since General Wood took command at Manila, an official inquiry covering a period of several years has disclosed some irregularities relating to furniture supplied to officers from the Government shops. Quartermaster-General Humphrey says that there is no evidence of dishonesty, but that something is due from several persons on what may be called open accounts.—— About 300 lepers are now living in the leper colony on the island of Culion, and all the Philippine lepers will be placed there. It is the purpose of the Government to make this colony or settlement a model of its kind. Already it has a fine public water supply and sewerage system, a large central mess hall and kitchen, and a hall for public amusements. The inhabitants will organize a municipality and in large measure will govern themselves. They have adopted resolutions thanking the Government for what it has done for them.——An attempt to exterminate the mosquitoes in Hawaii will be made by the Hawaiian Government. Goldfish that eat mosquito larvæ will be imported, probably from Mexico. An expert recommended by President Jordan, of Stanford University, has been employed to procure the fish and place them in Hawaiian waters.

The Agreement with Santo Domingo

Some light is thrown upon the origin of the fiscal agreement with Santo Domingo by the official publication of a dispatch, dated December 30th, 1904, from Secretary Hay to Minister Dawson. It appears that the initiative was not taken by the Government of Santo Domingo, but that the agreement was suggested to President Morales by our Government, owing to complaints of other Governments that, under the arbitral award, American claimants were getting a lion's share of the revenue. The dispatch was as follows:

"Confidential. You will sound the President of San Domingo, discreetly but earnestly, and in a perfectly friendly spirit, touching the disquieting situation which is developing owing to the pressure of other governments having arbitral awards in their favor and who regard our award as conflicting with their rights. Already one European government strongly intimates that it may resort to occupation of some Dominican customs ports to secure its own payment. There appears to be a concert among them. You will ascertain whether the Government of San Domingo would be disposed to request the United States to take charge of the collection of duties and effect an equitable distribution of the assigned quotas among the Dominican Government and the several claimants. We have grounds to think that such arrangement would satisfy the other powers, besides serving as a practical guaranty of the peace of San Domingo from external influence or internal disturbance."

Later communications indicate that at first Morales was restrained by dissent in his Cabinet from responding favorably to the suggestion.——A reduction of the foreign claims having recently been discussed, the secretary of the Council of Foreign Bondholders (in London) says that British holders of Santo Domingo bonds will not entertain such a proposition. It has been suggested by Santo Domingo's Minister of Finance at recent conferences in Washington that a commission be appointed to examine all the foreign claims and reduce some of them, in order that the entire foreign debt may be consolidated by a new loan of about $20,000,000.

Canada's Sunday Law

The Dominion Parliament has placed on the statutes the first federal legislation in relation to Sunday observance. On the first day of the coming March Sunday will be a national institution and a legalized day of rest in all Canada. The measure was an extremely difficult one to handle, in view of industrial differences in communities and the various religionists in the Dominion. Very wisely, therefore, did the government base the legislation on the humanitarian ground—the need of Sunday as a day of rest. The persistent efforts to exclude the Jews and others, who do not observe Sunday, were emphatically rejected on the ground that unfair advantages would come to them in many industries, while those serving in their employ would be at corresponding

disadvantages with regard to observing Sunday. It was, therefore, agreed to hold to the one day for all classes and creeds. The Act will, of course, permit all works of "necessity and mercy." Trading, all work for remuneration, theaters, games, sports and amusements for gain are prohibited. Excursions will not be allowed, nor can freight trains be made up or started at a Canadian point. Newspapers cannot be published, imported, nor given out for sale and distribution. No employee engaged in telegraph, telephone or transportation lines, or any industries calling for Sunday labor will be required to do his usual work unless he be allowed during the other six days twenty-four consecutive hours without toil. The penalties for violation are graduated. The fine for a workman is from one to forty dollars, for an employer from twenty to one hundred dollars, and for a corporated employer from fifty to five hundred dollars. In certain sections opposition has been developed against the Act, but on the whole it is well received. It was made a government measure, and to the personality and influence of Sir Wilfrid Laurier is ascribed its successful enactment.

British Educational Act Overthrown

The political situation in England has been thrown into confusion in a somewhat amusing manner by the decision of the Court of Appeals, that the present Education Act does not authorize the appropriation of money out of the public rates for religious teaching, and that the local authorities are not obliged to raise funds for those purposes. It was this feature of the existing law which has raised such a disturbance in England for the past four years. The Non-Conformists held that the Government had no right to impose taxes upon them for teaching their children religious doctrines which they did not believe, and many of them refused to pay the rates and suffered imprisonment and allowed their goods to be seized and sold at public auction, rather than voluntarily pay the tax they considered unjust. This was one of the main issues of the election, and the first action of the new Liberal Government was to introduce an Education Bill which differed from the old chiefly in not permitting sectarian religious instruction to be paid from the rates or be given by the public school teachers. This bill, after having been bitterly fought, passed the House of Commons and is now in the hand of the Lords. According to the decision of the two justices of the Court of Appeals the "passive resisters" were legally right, and Mr. Balfour's bill did not provide for the denominational instruction any more than the new bill of Mr. Birrell's, against which he has been so strenuously fighting. It is uncertain just what effect this will have upon the pending bill. The Anglican party of the House of Lords will not have so strong a motive to oppose it nor the Liberal Government to force it thru now that the most objectionable feature of the former act is eliminated. The Law Lords have the power to reverse the decision of the Court of Appeals, which would again make the conflict intense between the House of Commons and the House of Lords.——The Royal Commission which was appointed to investigate the scandal about the war stores in South Africa has reported that the charges of wholesale corruption made by General Butler were unfounded, but the commission severely criticises the officers and public servants for incapacity, stupidity and neglect, which resulted in losses of about $5,000,000. A number of non-commissioned officers are charged with receiving bribes, and the Army Service Corps is declared to be utterly wanting in business training and experience.——Alfred Mosely, who has brought over excursions to America to investigate our industrial and educational conditions, has now arranged for a more extensive series of excursions. About five hundred school teachers of every grade, from the university to the kindergarten, will be brought over here in weekly parties of about thirty each, beginning November 30th. Dr. Maxwell Superintendent of the New York Public Schools, and President Butler, of Columbia University, are arranging the reception and tours of the parties.

The Russian Crisis

So far the Government has been successful in preventing any widespread or systematic disorder by the use of the sternest weapons of repression. There are, however, many indications of Ter-

rorists' plots. One of the most startling attacks was that made upon Grand Duke Nicholas Nicholaievitch, president of the Council of National Defense, while reviewing the maneuvers in the Grand Camp at Krasnoye-Selo. As the sharpshooters advanced across the field, firing volleys by squads, bullets began to whistle about the Grand Duke and his staff, who were on top of an entrenchment. No one was hit and the Grand Duke remarked: "It would be more realistic if the troop always fired ball during maneuvers, but this is an unpardonable negligence." An investigation proved that a large number of Guards had been supplied by civilians with ball cartridges to be used in place of the blank cartridges, with the intion of killing the Grand Duke. It will be remembered that a year and a half ago a saluting battery fired grape-shot at the Czar's party when he was blessing the waters of the Neva. An attempt was made to assassinate General Kaulbars, the Governor - General of Odessa, by a young and well - dressed girl who carried a bomb in her handbag. A short distance from the palace she accidentally dropped the bag, which exploded without injuring any one. The girl ran back to the hotel and shot herself with a revolver. She was the daughter of Lieutenant-General Printz and had been educated with the daughters of General Kaulbars. ——The general strike which was ordered to support the demand for a Constitutional Assembly resulted in a fiasco, owing to the disagreement among the leaders and the unwillingness of the workingmen to drop their work. The Black Hundreds, as the anti-revolutionist rioters are called, have been semi-officially organized under the name of the "League of the Russian People," and in some places have been given arms by the police authorities and recognized as special constables. An attempt was made to assassinate the peasant leader Annikin, near the same spot in Finland where the Dumaist Herzenstein was killed, in accordance with the system of reprisals by assassination adopted by the reactionaries. Russia has never been under a more stringent régime of repression than now. Hundreds have been arrested and imprisoned or sent to Siberia by administrative process within the last few weeks. The censorship is strict and no radical papers are allowed to appear. The two hundred and fifty members of the Duma who signed the Viborg Manifesto are to be prosecuted. The leaders of the mutinists of Sveaborg and Kronstadt are being shot in squads. The notorious prison fortress of St. Peter and St. Paul is again in use. Count Heyden states that his refusal to enter the Cabinet of Premier Stolypin is due to the fact that he would not allow his party two places in the Cabinet, and he demanded five in order to control the Government. Count Heyden, Prince Nicholas Lvoff and Michael Strakovitch have organized the "Party of Pacific Regeneration" for the purpose of advocating a constitutional monarchy, with popular representation and freedom based on the equality of all before the law.

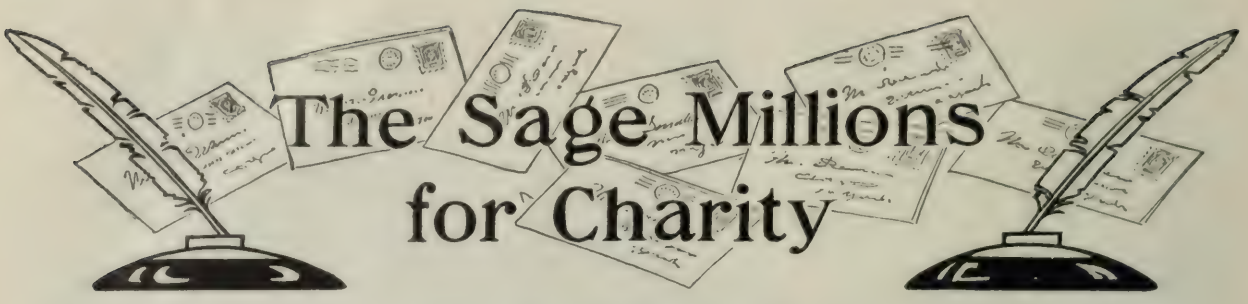
Premier Stolypin, who has promised reforms, and is pursuing a policy of repression in Russia.

Spanish Politics

Spanish cabinet changes succeed each other with perplexing rapidity, and the difference between them is not distinguishable at this distance. Since the calling of the Algeciras conference there have been three premiers, all of the same party—Señor Montero Rios, Señor Moret y Prendergast

and now Field Marshal Lopez Dominguez, and many shufflings of cabinet positions in the meantime. The last cabinet formed by Señor Moret lasted less than a month, when he gave up trying to secure a majority by combining the various factions of the Cortes, and asked for its dissolution. This the King was unwilling to do, and General Lopez Dominguez has assumed the task. This last change restores to the cabinet one of the strongest of its former members, Count Ramonones, who, as Minister of Justice, has inaugurated an anti-clerical policy which may lead Spain far in the direction that France has gone. The first conflict has come over the question of civil marriages, which are authorized by law, but which the Church declined to recognize as valid. The clergy refused to permit the burial in consecrated ground of those who were married by the civil form without the religious ceremony. The Minister of Justice issued a decree forbidding them to discriminate in this way against civil marriages. The Papal Nuncio protested against this action, and Count Ramonones offered his resignation to his colleagues, who declined to accept it and will sustain his action. The Government will introduce a bill into the Cortes, when it reassembles, to bring the religious associations under the same laws as industrial corporations. When the friars were expelled from France many of them established in Spain, and this has brought the question of their restriction and control to the front in this country, as in France. The Pope has insisted upon the resignation of the Spanish Minister to the Vatican. If the Government is supported in its policy by the Cortes, it is likely to lead to a revision of the Concordat regulating the relations of Church and State.

Persia Has a Parliament



Uncertain rumors of revolutionary movements in Persia have been reaching the outside world for many months, but the first definite and positive information that we have is the announcement that the Shah has granted a Parliament to his people. The causes of the popular movement resulting in this reform were not so much the oppression of the people and the maladministration of justice, for such conditions have prevailed in this country from time immemorial, but very curiously it was the mullahs, or priests, usually reactionary in their tendencies, who became leaders of the movement, and it was the example of Japan which aroused them to the need of reform to preserve their national independence from the encroachments of Russia on one side and Great Britain on the other. A celebrated Mohammedan preacher gave the keynote of the sentiment in these words:

> "We would be blind if we failed to recognize that it is by means of European science that Japan has vanquished Russia. It is by means of this and this alone that we also shall be able some day to defend our nationality and independence. Let us work."

The theological students in the Mohammedan schools have accordingly devoted themselves recently to physics, chemistry, history and foreign languages, instead of confining their attention exclusively to the Koran as formerly. This year a history of Japan in Persian became very popular. The Grand Vizier was a strong reactionary, and altho the Shah was prevailed upon last January to appoint a commission to consider Governmental reforms, the efforts of the commission were nullified by the Conservative Court party. On July 17th there was a strike of the clergy. The mullahs, despairing to gain their ends in any other way, held a great reform meeting in the chief mosque of Teheran and then departed in a body, ostensibly on a pious pilgrimage to Kum, a Shiah shrine eighty miles from the capital. The people, deprived of the benefit of clergy, besieged the Government to grant a national assembly. When the Grand Vizier attempted to use force, about five thousand of them took refuge in the British Legation. The Shah finally dismissed the Grand Vizier and ordered the convocation of a national assembly and the codification of the laws in accordance with the recommendation of The Hague Tribunal. The assembly will be composed of princes of the blood, priests, high dignitaries, merchants and representatives of corporations. No peasants will be included. All civil and constitutional laws will originate in the assembly and be presented by the Grand Vizier to the Shah for his signature.

August Fishermen

The Sage Millions for Charity

[The Independent has received the following brief letters in reply to our request for suggestions as to how the large wealth left by the late Russell Sage to his wife for distribution in philanthropy could be best expended for the public good.—Editor.]

Millions for Investigation and Research

By David Starr Jordan, Ph.D., LL.D.,
President of Leland Stanford, Junior, University.

Philanthropy, love of men, is practically interpreted as action, or a desire to act, in the direction of contributing toward the happiness or force of individual men, or toward the aggregate well-being or effectiveness of society.

This is wrought into action by the use of one's own powers to this end, or by the use of money, which is stored power. In individual self-spending one cannot go far amiss, but in the use of money in philanthropy wise direction is all-essential. Money loosely given always does more harm than good.

The acts of philanthropy divide at once into those intended to increase happiness or comfort or safety, and those intended to give greater effectiveness or a greater degree of self-activity. The first class is of lowest importance, because its effects are largely spent on the individual. The other makes possible, in succeeding years, better individuals and higher social growth. For the same reason that "a dollar in a university is worth more than a dollar in a jail," a dollar in a university is worth more than a dollar in an asylum or even in a hospital, unless the hospital is a part of a university, with a staff of research workers, so that the lessons it teaches will not be lost to the community.

The best forms of philanthropy are those which make men wiser and better fitted for the conduct of life. These bear compound interest, their effect on the individual life being multiplied in the lives of others. "There is always room for the man of force, and he makes room for many." The greatest need of America today is material and opportunity for the highest intellectual pursuits, for scientific research and humanistic investigation. Therefore, of many good uses, the best opening in philanthropy today in America is in making it possible for men of the highest intellectual and moral type to realize their best possibilities. This can be done in the strengthening of research departments of real universities, in providing means for investigation to individuals of promise, and in pushing forward every great enterprise which promises to forward the political, moral or intellectual well-being of individual men and thru them the higher social well-being and a greater degree of individual happiness.

Stanford University.

For University Research

By James McKeen Cattell, Ph.D.,
Professor of Psychology in Columbia University, and Editor of "Science."

It is my opinion that no one knows how some $60,000,000 can be best expended for the public good, or whether it is possible to use such a sum for the public good. I have no great faith in charity or in endowments. My own interests lead me to believe that the largest returns—moral, intellectual and material—come from the investment of money, time and ability in scientific research. As the material results of scientific investigations accrue to the whole people rather than to the individual who makes them, some means must be found by which the

investigator shall be paid for his work. The most satisfactory solution would be for the municipality, State or nation to pay the cost of scientific research. Whether this end is advanced or retarded by private subsidies and endowments is an open question. If I were responsible for the expenditure of $60,000,000, I should probably establish a research university at Washington or divide the money among the universities that now carry on research; but I should not have complete confidence in the wisdom of such a course. Mr. Beit seems to have acted sensibly in bequeathing $6,000,000 for improving the means of communication in South Africa. Semi-rural communities established in the neighborhood of large cities would be a good use for money, but they would probably prove to be profitable investments rather than charitable institutions. It may be that Mr. Sage did the best possible thing by demonstrating the futility of large accretions of wealth instead of paying tribute for the stupefaction of the public conscience.

GARRISON, N. Y.

For a Graduate College of Agriculture

BY E. BENJAMIN ANDREWS, D.D., LL.D.,

Chancellor of the University of Nebraska.

IF I thought that Mrs. Sage had the strength to undertake an out-and-out new measure of philanthropy I should for my part recommend her to erect a graduate College of Agriculture or a graduate College of Veterinary Medicine and Surgery. Among the philanthropies already established, the one I deem most certain to work vast and unqualified good to America and to humanity is the General Education Board. It has a United States charter and a nearly perfect organization. Its benefits are applied regardless of creed, race, section or politics. With the income of fifty million dollars added to its present yearly resources it could rapidly and in a healthy manner extend the blessings of thoro higher education to our neediest States and communities.

For Increased Salaries of College Teachers

BY FRANKLIN H. GIDDINGS, LL.D.,

Professor of the History of Civilization in Columbia University.

IT is understood that Mr. Sage left his fortune to Mrs. Sage to use according to her own judgment, and this she undoubtedly will do.

If I were myself responsible for the disposition of a great property I should apply it to the most urgent educational need of the time, namely, to increasing the salaries of college and university professors. No college or university in America today is able to command the entire time and strength of the ablest scholars unless they happen to be men of independent means or choose to remain unmarried. A large percentage of the best educational energy is being expended in miscellaneous avocations—newspaper, magazine and text-book writing, occasional lecturing, expert scientific work, legal or medical practice and similar pot-boiling. The cost of living in America has increased fully one-third in the last ten years. Unless salaries are materially increased, and very soon, many of the ablest young men that now should naturally be looking forward to the academic career, will turn to other occupations, and the quality of our university activities will distinctly suffer for at least an entire generation.

NEW YORK CITY.

For Homes for Retired School Teachers

BY MARION HARLAND.

WERE I in the place of the good woman who is put in trust with a more than princely fortune, and had my antecedents been the same as hers, my mind would turn, instinctively, to the honorable guild to which I once belonged, and busy itself with plans for the substantial welfare of disabled teachers of my own sex.

The labor that falls to the teacher's lot wears heavily upon nervous forces. And to be old in years and to be superannuated are identical in the opinion of the

board of education. There are no vacancies in public or in private schools for elderly women. In some States the toilers — to whom the country is indebted for the mental training that is to lift the rising generation above the illiterate immigrant whose own one-half the pupils are—are pensioned after twenty years' service. In other commonwealths they must live out the rest of their days upon the savings they have pinched out of their salaries.

Had I the wealth of a multi-millionaire I would endow homes—not asylums—for wornout teachers in pleasant suburbs of our large cities and in country towns. Each should have its library and chapel, and each of the gentlewomen gathered within the hospitable walls should occupy a small, convenient and well-appointed suite of rooms as long as she desired to hold it.

The home should not be a "charity," but part of the payment of a debt the community owes to its benefactors.

This is no chimera of an unpractical fancy. Homes for wornout brain workers are conducted in New York and in New Jersey upon a scale adapted to the means of those who have the pious enterprise in hand. At least one-half of the honored guests in these are retired.

When one ponders upon all that is wrapped up in that little word, "Retired," is it strange that the heart should burn and the eyes glisten in the imagination of what might be wrought by the outlay of a tithe of the wealth at the command of the woman who, in her youth, was one of these "benefactors"?

For Endowment of Independent Newspapers

By Edward A. Ross, Ph.D.,

Professor of Sociology in the University of Nebraska.

I will not presume to designate the disposition of the Sage millions "most beneficial to the public." But one opportunity of splendid service is the endowment of public newspapers. Colossal as are the services of the press they are yet far below what they might be. Venal, subsidized, special interest, partisan and yellow newspapers scream us deaf, lie us blind, and force the self-respecting journals to compromise with their methods. If only there existed some agency for disseminating truth about the present as trustworthy as is the university for disseminating truth about the past! What irony that more pains are taken to find just what took place in Shay's rebellion than what is taking place in the Colorado labor war! Suppose Mrs. Sage became the patron saint of public journals, as Mr. Carnegie is of public libraries. Imagine in every commonwealth an endowed daily newspaper, heedless of the shekels, in charge of a board of trustees nominated by the leading organizations of the community. The boards of trades, the granges, the labor unions, the professional associations, the civic leagues, the benevolent societies, the churches and the colleges would each have a representative. Such a paper would print the significant news without fear, favor, bias or comment. When the wires were choked with lies it would hurry its experienced fact collectors to the spot. The Sage papers would support one another and might develop a news service of their own. Those of unkempt brain who crave their daily dram of murders and suicides could resort to *The Shocker,* but those who now have to sift a handful of truth out of a bushel of chaff would welcome a press emancipated from the commercial motive. The daily press is now where the higher education would be if Church and State had founded no colleges, but left the dissemination of learning to profit-seeking institutions. It is where the training of teachers was in the era of cheap, circus lemonade "normal schools" of twenty years ago. The Sage papers would emancipate journalism, now just on the verge of becoming a learned profession, from the thraldom of the counting room. They would lift the ethics of newspapers, double their civic value, quadruple their educative services and decuple their civilizational importance.

Lincoln, Neb.

For the Socialist Party

By W. J. Ghent.

Author of "Our Benevolent Feudalism."

Doubtless the agents of all the various charities in the United States will eagerly look for a slice of Mr. Russell

Sage's money. Each will be quite sure that his charity is the one best adapted for lessening the ills of this confessedly very ill world.

And yet there are few things of which we Socialists are quite so sure as that virtually all the money so expended is wasted. Despite the enormous benefactions of recent years, the amount and degree of privation in the world show no signs of lessening. Evolution has brought about social production—that is, production by great aggregates of men and women working at common tasks in huge workshops. But the ownership of the tools of production is vested in a comparatively small class of the people. This disharmony between the mode of production and the character of ownership dooms an ever-increasing number of persons to disemployment and privation. The paying out of even millions of dollars to relieve the necessities of the worst victims of this chaotic *régime* is merely dealing with effects, regardless of causes.

If Mrs. Sage and her advisers want to make their money count to the utmost in permanently relieving distress, let them send it to the national secretary of the Socialist party of the United States. I cannot say whether it would be accepted. The matter would have to be decided by a vote of the National Committee. Personally, I should be in favor of accepting any gift of this sort. For the crux of the "tainted money" question is the condonation by the recipient of the means by which the money was gained. Most of the money gained under the present *régime* is tainted, and it requires a supernormally shrewd smell and touch to determine what is unafflicted with pathogenic microbes. We cannot therefore be choosers. But we can refuse to sell our moral standards or permit a gift to alter our attitudes.

In this case both the donors and the public might rest assured that no possible change in the attitude of the Socialist party would result from such a gift; and that every cent of it would be expended for the bringing about of a complete overthrow of the present *régime* of fraud, grafting, lying, robbery and slaughter, and the instituting in its place of a *régime* wherein charity would be unnecessary.

But then there is not the remotest possibility that one cent of this enormous fund will be so devoted. It will all go to patching up the weak spots of the present order, and so make for its continuance a while longer.

New York City.

For Broad Education

By James W. Cooper, DD.,

Secretary of American Missionary Association.

The whole world contributes toward the making of a great fortune, and the whole world may well share in its distribution. It should be devoted to humanity. At home, abroad, in the city, in the country, it should be given for the enlightenment of the people. Far more may be accomplished with the coming than with the departing generation. Let the money, therefore, be devoted broadly to education: Christian education, because men need to have high and true ideals and be able to attain them; scientific education, because men need to know themselves and the world they live in; industrial education, because all must work and should be trained to work effectively; artistic education, because of its refining influence in the home and in society and its contributions to the pleasures of life.

A hundred millions is not such a prodigious amount of money for this purpose, but it will do something. Let it be widely distributed. Twenty-five millions for the betterment of the social conditions of the city of New York—settlements, trade schools, schools of music and art, model tenements, parks, playgrounds. Twenty-five millions to be added to the general funds of the best of our great universities in the North and West, and to be devoted to research and instruction. Twenty-five millions for education in the South, where illiteracy is greatest, to be funded and administered by trustees, the income to be divided equally between the two races and used for the enlargement and perfection of schools already established, industrial, normal and collegiate. Twenty-five millions to go to other countries

for Christian schools, hospitals and Y. M. C. A.'s, to be administered by our great missionary boards and the international committee.

Such a use of a hundred millions would be neither sensational nor spectacular, but it would be safe and sure, and would add immensely and for a long time to the sum of human happiness.

NEW YORK CITY.

For Anti-Vivisection

BY ELIZABETH STUART PHELPS WARD.

IF I could influence the disposer of a fortune, I should devote it to humane work, especially in checking what is called scientific research, in the dissection of live animals—a barbarous and unjustifiable practice.

NEWTON CENTRE, MASS.

Food Standards

BY HARVEY W. WILEY, Ph.D., LL.D.

[Dr. Wiley is Chief of the Bureau of Chemistry in the United States Department of Agriculture, and has written much on Agricultural Chemistry.—EDITOR.]

THE question of standards of purity for food products is one which interests all classes of our people. The manufacturers of food products, first of all, are affected by the establishment of standards, because the products which they make necessarily conform thereto. Dealers in food products are equally interested, since if they dispose of products which are not of standard quality under the name of the standard article, they are likely to come into conflict with the local State laws. The consumer, most of all, is interested in food standards, because if they are the proper kind they assure him in his foods articles of diet which have qualities which have been approved by competent authorities.

From the executive point of view the person who is called upon to execute the Food Law needs perhaps most of all the help of standards in order that he may determine in any given case whether a sample of food submitted to him for examination conforms to the provisions of the law. It is self-evident that any one called upon to institute proceedings for the violation of the Food Law must have some basis of action. This basis, of course, is furnished by the law itself, but the law cannot possibly go into the minute definitions and distinctions of what would constitute offenses against its provisions. The law can say that foods shall be pure, wholesome, made of sound materials, free of disease and decay, and that they shall have no valuable constituent abstracted from them, nor any inferior constituent added thereto, and that they shall be free of deceptive colors and of all substances of an injurious nature. The opinion of the executive officer in respect of the violation of the law should be based upon such regulations and standards so as to secure some uniformity of action thruout the area where the law applies. For instance, it may be assumed that in the execution of a food law 500 officials are actively employed, each of whom may be independent in respect of the judicial circuit to which his activities are confined. We may assume further that the same article of food is examined independently by the 500 agents of the law. It is highly important that some guide should be provided for these agents which would enable them to come to a uniform decision. It would seem rather unjust that in the examination of the same substance 250 of these agents should deem the law to have been violated and bring an action against the culprit, while in the other 250 instances no action would be taken. This, of course, is an extreme case, but in

point of fact the execution of the English food law during the quarter of a century in which it has been enforced shows many instances illustrating the principle above mentioned. For this reason in England there has lately arisen a demand for the fixing of food standards, and Parliament has authorized the Board of Agriculture to establish such standards for dairy products. It does not need any chain of reasoning to show that if standards be needed for dairy products they are also needed for all forms of food products. The food laws of the various States and municipalities in the United States often fix standards for the guidance of the officials, and theoretically it is undoubtedly a principle which remains undisputed that it is advisable that such standards should be fixed by legislative action. For instance, the Congress of the United States has enacted certain food standards which are in force in the District of Columbia. Milk must contain at least 3.5 per cent. of fat, cream 20 per cent. of fat, butter not more than 12 per cent. of water nor more than 5 per cent. of salt. Bread shall not contain more than 31 per cent. of moisture nor more than 2 per cent. of ash nor less than 6.25 per cent. of protein.

The State of Maryland requires by statute that milk shall not have more than 87.5 per cent. of water, not less than 12.5 per cent. of milk solids, of which at least 3.5 per cent. shall be butter fat. A great many of the States have standards for dairy products, but very few have anything like complete standards established for general food products. There is a very insistent demand from the food officials of the different States for some uniform standards for their guidance wherever their legislatures have not fixed specific standards in the law. To this end the National Association of State Dairy and Food Commissioners has for some time had a committee on food standards appointed for the purpose of recommending uniform standards for adoption by the various States. While no definite conclusions have been reached, as a result of these efforts great progress has been made toward a practical unification of standards in all cases where the laws are silent.

A great deal has also been done in the same direction by the Association of Official Agricultural Chemists, a body representing the chemists connected with the agricultural colleges and experiment stations of the various States and Territories, and of State and municipal authorities charged in any way with the inspection and control of fertilizers or of food materials. This is a very large and influential body of men, representing every part of the country, and the action which they approve has the force and authority of the organization. For almost ten years this association has had a committee actively engaged in the study of standards of purity of food products and a great deal has been accomplished in that line. In many cases the action of the Association of Official Agricultural Chemists has been approved by the State dairy officials. A large majority of the standards thus established have been at least provisionally accepted by the State authorities pending further action on their part and on the part of the various legislatures of the States.

It may seem rather strange that an attempt should be made to fix a standard for a natural product such as milk. A moment's reflection, however, will show the desirability of such a standard. The most valuable part of milk for market purposes is the fat which it contains. By partial milking a product is obtained which has a low content of butter-fat and by finishing the milking a product is obtained which has a very high content of butter-fat. Thus, in drawing milk from the same animal, two distinct kinds can be secured. It is universally held that milk must be the entire milk of the animal at the time of milking. If such were not the case the dairymen could milk two-thirds of the milk from each cow and sell as milk, and then milk the other third and sell as cream. To avoid such a condition of affairs the standard for fat in milk has been fixed by many State and municipal authorities and by the National Government. Again, there are some varieties of cows, for instance, the Holstein, which give great quantities of milk containing small quantities of fat. Often a complete milking of the Holstein cow will give a product which contains less than 3 per cent. of fat. If this milk be allowed to be sold without

standardization it would come into direct competition with standard milk containing about 3.25 or 3.5 per cent. of fat or with the whole milk of the ordinary herd, which contains almost 4 per cent. of fat.

A standard, therefore, does not always mean a guaranty of purity, as, for instance, the milk of a Holstein cow with only 3 per cent. or less of fat, as far as purity is concerned, is just as free from criticism as the milk of the Jersey cow containing 6 per cent. of fat. The object of a standard in this case is therefore to protect the consumer against receiving an adulterated article or a natural article of an inferior quality.

In 1903 Congress passed an act authorizing the Secretary of Agriculture to fix standards of purity for food products and to enable him to reach just decisions he was authorized to consult the committee of the Association of Official Agricultural Chemists and such other experts as he deemed necessary. Acting under that authority the Secretary of Agriculture has established standards of purity for nearly all of the common food products. These revised and perfected standards are published as Circular No. 19, Office of the Secretary, copies of which may be obtained by addressing the Secretary of Agriculture or the Superintendent of Documents. The food standards established refer to meats, manufactured meats, lard, milk, cream, butter, cheese, ice cream, whey, kumiss, cereal grains and flours and meals made therefrom, fruits, evaporated fruits, canned fruits, preserved fruits, jams, jellies, marmalades, fruit butters, vegetables, dried vegetables, canned vegetables, pickles, sauerkraut, ketchup, sugar, maple sugar, molasses, sirups, glucose and glucose products, candy, honey, spices, peppers, flavoring extracts, edible vegetable oils and fats, tea, coffee and cocoa products, fermented fruit juices, including wines, cider and vinegar, and salt.

All of these standards have been very carefully considered, the people who manufacture the goods have been consulted, and expert opinion of all kinds has been secured respecting them. It is believed, therefore, that they are just and equitable, and will meet the approval of practically all persons who are interested in the matter save those who desire to manufacture and sell adulterated articles and articles of inferior quality. These standards, as has already been intimated, have been approved by many of the States, and in a few instances have been enacted by the legislatures of the States as the legal standards therefor. Their general adoption will do much toward unifying the practices before the State and Federal courts in all matters relating to the adulteration or misbranding of food products.

There are many forcible objections to the adoption of standards other than those coming from the manufacturers and dealers in adulterated, misbranded and inferior food products. If, for instance, a minimum standard of purity be established, as in the case of milk, where the national standard established by the Secretary of Agriculture requires that there shall not be less than 3.25 per cent. of butter fat, it is claimed by many that this will be an inducement to the degradation of the average milk to the basis of the standard. It is well known that the average milk furnished by the dairy herds thruout the United States contains in round numbers almost 4 per cent. of butter fat. It would be possible, therefore, to so debase the average milk of the United States as to abstract from it in round numbers three-fourths of 1 per cent. of fat and still have it comply with the standard in this particular. But it must be remembered that the standard does not permit of debasement, and its chief object is to prevent inferior articles from being sold as standard foods. If, therefore, the standard for milk were fixed at 4 per cent., which is the average of the milks of the United States, it would exclude from the markets fully half of all the milk produced, for it may be assumed that the standard being an indeterminate point, one-half of all the milks produced in the United States would fall below this standard and one-half would be above it.

Thus to fix a standard to represent the average quality would be unreasonable and impracticable. It must be remembered too that any debasement of a

product, no difference whether it is above or below the standard, is itself an adulteration and is punishable as such under all State and Federal laws. It has been proposed in England to fix the standard of water in butter at 16 per cent. An argument was recently presented to the Society of Public Analysts in London against the changing of the standard, because the average content of water in English butter is only 12 per cent., and if the maximum standard were made 16 per cent. there would be an effort made on the part of all butter makers to incorporate as much additional water in the butter as would be possible without transgressing the maximum standard. To this it may be replied that to fix the standard of water in butter at 12 per cent., which is about the average, would exclude perhaps half of the pure butters on the market, which contain slightly above 12 per cent. of water. If it were shown that butter which naturally has 12 per cent. of water were purposely so manipulated as to increase its content to 16 per cent., that butter would be adulterated anyway, whether it transgress the standard for water or not.

The purposes, therefore, for which standards of foods are fixed must not be lost sight of if those standards are to be used as a basis of protection to the public. If standards are fixed solely as an inducement to producers to improve the quality of their goods, then they should be made in all cases high, representing the very best qualities of the articles produced.

Considering all the arguments which have been advanced for and against food standards, I think it is undoubtedly true that they are beneficial and, as a basis for the enforcement of food laws, necessary.

WASHINGTON, D. C.

To Honor

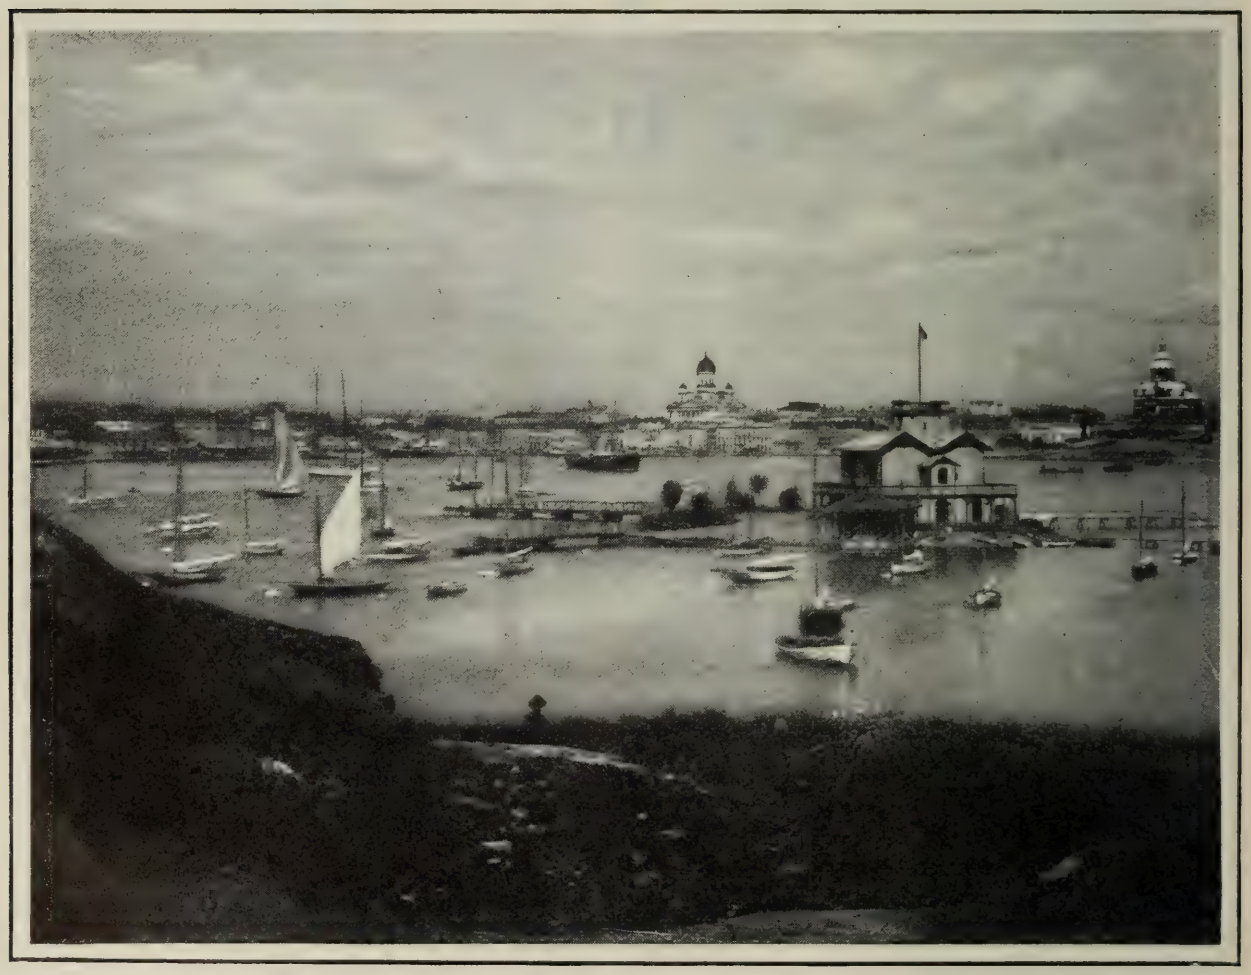
BY LOUISE IMOGEN GUINEY

THAT I have tracked you from afar, my crown I call it, and my hight:
All hail, O dear and difficult star! All hail, O heart of light!
No pleasure born of time for me,
Who in you touch eternity.
If I have found you where you are, I win my mortal fight.

You flee the vale: I therefore choose summit and solitude for mine,
The high air, where I cannot lose our comradeship divine.
More lovely here, to wakened blood,
Sparse leaf and hesitating bud,
Than rosaries under valley dews for which the dryads pine.

Spirit austere! lend aid: I walk along inclement ridges too.
Disowning toys of sense, to balk my soul of ends untrue.
Because man's cry, by night and day,
Cried not for God, I broke away.
On, at your ruthless pace! I'll stalk, a hilltop ghost with you.

OXFORD, ENGLAND.



Sveaborg and the Red Guard

BY HERMAN MONTAGUE DONNER

[It is generally felt that Finland is the key to the Russian problem, and many have thought that the liberty-loving Finns, who have suffered so much from Russian tyranny, should openly take the side of the revolutionists and give them the territorial center which seems indispensable to their cause. Consequently there was some surprise at the attitude of the Finnish Government on the occasion of the mutiny at Sveaborg and Skatudden, and especially at their action in arresting Captain Kock and disbanding the Red Guard. Mr. Donner, who is a native of Finland, and in close touch with the Constitutionalist leaders, here explains the political situation at Helsingfors.—EDITOR.]

IN order to explain the reasons for the division of sentiment of the Finnish people in regard to the revolutionary movement it will be necessary to retrace in outline some phases of the political struggle in Finland since the famous ukase of last October, restoring to the inhabitants of the Grand Duchy the constitutional liberties of which they had been robbed by the Russian Government in 1899.

I may state at the outset that from the moment in October last when the Czar accepted the list of Senators for the new native government drawn up by Leo Mechelin mainly from the ranks of the Constitutionalist party, the Finnish Ministry (as the heads of the new Senate practically became) was made the object of incessant attack by the Social Democrats, an organization new in the party politics of Finland, and as aggressive and pretentious as it was new. Purporting to speak in the name of the great Fin-

The Harbor of Helsingfors, Finland. On the right is the Russian church on Skatudden, which was held by one party of the mutineers. The shells from the fortress of Sveaborg, where the principal mutiny occurred, reached the Yacht Club building shown in the picture and killed one of the spectators on the porch.

The Market Place of Helsingfors, from which the Cossacks drove the people who were watching the conflict between the mutineers of Skatudden and the loyal troops. At the right is seen the Russian church on the island of Skatudden, which is connected with the mainland by a small stone bridge. The central building overlooking the square is the Imperial Palace, from the windows of which can be clearly seen the fortress of Sveaborg at a distance of three miles. The Nyland Regiment of the Finnish army is passing in front on its last parade before its disbandment, 1901.

nish proletariat, hitherto unrepresented in the Diet which met triennially in Helsingfors, it formulated various demands, many of them reasonable, not a few unreasonable, among the latter being the insistence on an immediate National Assembly elected on a basis of universal suffrage, to take the place of the extraordinary Diet, convoked by the Czar in accordance with the Finnish constitution, which Diet was to be elected in the regular orderly procedure guaranteed by that constitution, for the purpose of considering and adopting wide-reaching changes in conformity with modern requirements in the organs of government. In case the Senate declined to fall in with their views, they resorted to menaces of a general strike, and even of violence. In this, however, they over-reached themselves, and arousing the mistrust of the law-abiding elements thruout the country, found themselves instrumental by indirection in the return of an overwhelming majority of Constitutionalists in the Diet, which, thereupon, aided by a special committee of the Senate, proceeded to elaborate, after exhaustive discussion, a series of reforms which included the extension of the franchise to all classes and both sexes above the age of twenty-four, with certain exceptions, such as criminals and paupers dependent upon the community. Some of these restrictions were fought by the Social Democrats, whose declared policy it had become to oppose the Constitutional Government, and identify themselves with the Labor party and the extremists in general, who, while denouncing class privileges and capital in the fashion long prevalent in other countries, did their best to stimulate class hatred and social animosities.

In this connection the rise of the Red Guard is significant. Originally formed under the leadership of a Finnish ex-army officer at the time of the great na-

tional strike of October for the ostensible purpose of safeguarding the property and lives of the citizens, and particularly the artisan and laboring classes, of the capital during the days of transition from the old Bobrikoff *régime* to the new order of constitutionalism, this body, drilled in regimental tactics and in part armed, refused to disband after the immediate need for its services was over; and, by virtue of the inclusion in its ranks of many men of anarchistic tendencies, its parrot-like diatribes against the iniquities of capital (from which, be it said, the Finns have really suffered less than any other people), and the reputed close affiliation of its leaders with the Socialists and revolutionaries of Russia, to whom it was suspected of smuggling arms by the vessel-load thru the small seacoast villages of Finland, and scandals connected with its management, it so fell into disfavor with the bulk of the law-abiding citizens of the better classes that the latter were impelled to organize for protection against their would-be protectors, and the Communal Guards were thus called into existence as a counterpoise to the Red Guard.

It is undeniable that the Red Guard has now an extensive membership thruout Finland, due largely to the fact that Captain Kock and others of its leaders saw early the danger of allowing adventurers and men of loose character or violent opinions to hold office in its ranks. On the occasion of a big meeting of the organization in Helsingfors, toward the end of April, there were present 250 delegates, from all parts of the land, which, on the official basis of one delegate to every thousand members, would give a membership of no less than 250,000 out of a total population of 2,750,000. On that occasion the leader's address was admirable in many respects, advocating honesty, devotion to duty, higher acquirements, and a greater degree of intelligence as always needed, and absolutely indispensable in those who aspired to leadership. He strongly urged against the use of violence or hasty and inconsiderate action, even in case the weapon should be drawn on which the workingmen placed so much reliance, the "general strike," and toward which they had made such extensive preparation.

It cannot be said that this laudable advice has been entirely adhered to in the case of Captain Kock's followers, and in so far as it was departed from dissension was inevitably bred, and defections in large numbers were recorded, even among those very working classes for whose especial behoof the whole movement had its inception. This, however, was but a natural consequence of a clause in the articles of membership, decided on at the April meeting, to the effect that every member should belong to some Social Democratic organization. Thousands of sober-minded workingmen whose views inclined to the tenets of the predominant Constitutionalist party were thus driven into forming a rival association, which put moderation into practice as well as words, and who strongly antagonized the pet scheme of the Socialists and the Red Guard—the great national strike.

During all this time, it must be remembered, active intrigues were being carried on in St. Petersburg to overthrow Finnish autonomy once more and re-introduce the loathsome tyranny of the days of Bobrikoff. Indeed, so near success were these intrigues at one time that Governor-General Gerhardt actually tendered his resignation to the Czar in case the latter should decide to give ear to his reactionary advisers, of whom the notorious General Trepoff was the most envenomed, and establish over Finland the military dictatorship under General Serubayeff for which the latter clamored, under the plea of an imaginary revolutionary plot, to which the activity of the Red Guard and the discovery of a mysterious shipload of arms in a stranded vessel off a Finnish fishing village gave some color. Luckily, however, those familiar with the true state of affairs in Finland succeeded in dissuading the Czar from a return to the iniquitous policy of persecution and despotism, the consequences of which could not fail to be disastrous in the extreme.

The foregoing will, I trust, make clear the situation in the Finnish capital when the flame of revolt suddenly broke out at its very gate. The intimate connection of the Socialist Red Guard with the Russian revolutionary movement at once became apparent in various ways: in the access which some of their members ob-

tained to the fortress of Sveaborg, so jealously guarded from foreign eyes; in the call of its leaders for the general strike, for which they had so long been preparing, as a means of supporting the (then) successful mutineers; and in the cutting of the railway to St. Petersburg to prevent the expected reinforcements from joining the loyalist troops at Sveaborg and Skatudden.

There is no doubt of the sympathy of the whole Finnish people, on principle, with the reformers in Russia, but as the Moderates had triumphed in the dark November days, so here again the Constitutionalists, and with them the bulk of the population, grateful for the restoration of their liberties, and believing in their orderly and peaceable development, were unwilling to do aught that would jeopardize their present good relations with the Russian Government or give ground for fresh attacks from the reactionaries that might then sway the Czar. Hence, when the Red Guard and the workingmen proceeded to set at naught their leader's wise April maxims, and resorted to violence to compel the big strike, the Communal Guards, of whom I have spoken above, recognized with promptitude their opportunity for service, and the plan of action of the extremists failed, since force was there to meet force.

New York City.

Our Great American Game

BY DR. J. P. CASEY

Captain of the Brooklyn Baseball Club, National League.

AMERICAN baseball as compared with English cricket is as the express train to the stage coach. There is indeed no fair comparison, and they would never have been compared save for the extraordinary complacency of some Englishmen who, without knowing anything about the matter, concluded that cricket must be superior because it *was* English.

Cricket may be played by two hundred pound valetudinarians, who need Mr. Pickwick's wheelbarrow to trundle them about the field. A game may last for a week, and there are white tents on the lawn and leisurely lunches. It is all dignified and gentle, and the individual in long, flapping white pantaloons who can back up a few feet and succeed in catching a high fly is the hero of the occasion.

But baseball, when a man plays that, well, he must be an athlete from head to toe; he must be able to jump like a kangaroo, run like the wind, throw like a cannon and launch himself thru the air like a bombshell. He must be all daring, he must know the game in every pore of his skin and meet a problem in a fraction of a second.

There's no delay in a game of baseball. Its march is inevitable. A man's stay at the bat is limited. He can only receive five balls from the pitcher (not counting fouls) before the arrival of his batting crisis. If the sixth ball comes straight and he misses it, off goes his head; he's out and another reigns in his stead.

So a game of baseball is concluded within a limited time, and spectators can watch it from beginning to end without any weariness or breaking off.

And what a game it is to watch! There's work for two or three pairs of the sharpest eyes to see all that is going on. There's the man that is trying to steal from first base to second, lying far out from first base, with a spring in his body like a hickory bow, ready to dart for second base and hurtle himself thru dust to immortal glory if he sees the smallest sign of weakening in catcher or pitcher. He is brave, but not rash; he is far out, but not too far; for the pitcher is watching him with half an eye and stands ready to launch a Jovian thunderbolt that will dash him to pieces if he is off base.

Tense thousands watch. The fate of empires hangs on Kelly's slide.

But this is only one little detail. At the same time there is to be seen the great battle between pitcher and batter and also the runner trying to steal home from third base. A good game is a three-ringed circus with a tingle of excitement for every moment. When a base hit is made, with two men on bases in a close game, lightning looks slow and poky in comparison with the way things happen out on the diamond; the ball sizzles about, burning the air, the men on the field dart like streaks, while on the stands twenty thousand madmen worship their gods with a great outcry.

Such is baseball, our baseball! A game that clutches spectators and squeezes them till they yell; a game that makes centenarians dance and howl and throw peanut shells at the umpire. There's nothing like it in the way of games. Maybe the Spanish bull-fight comes next — when you get the real thing. But even in that there's only one thing to watch—the bull—and he isn't working all the time. We'd have to go back to Nero's times, when Rome flowed into the Coliseum, sixty thousand strong, to watch the gladiators and the beasts, in order to match the excitement of a first-class game of ball.

Take that triple play made by our boys in Cincinnati recently. It was the sixth innings and the score was a tie. Cincinnati was at the bat, with nobody out, a man on first base and another on second. Kelly, the batsman, hits the ball to Alperman, who throws to Lewis, on second base, Lewis returns the ball to first base, Hummell, who throws it to Bergen, the catcher, just in time to catch Huggins, at the end of a desperate slide. There was action—three men out—in an eye-winking—a perfect triple play by our boys, a thing only seen once in five years or more. Cincinnati's soulless cohorts were mute because their champions were the victims. Yet that play is not lost or forgotten. The glory of the men who made it will thunder down the resounding ages long after the forest is growing again on the spot where Cincinnati now stands.

When American baseball was first played in England—thirty years ago—the only extraordinary thing the Englishmen saw in it was the sliding. They were willing to admit that that was wonderful; the Prince of Wales, who is now King, was especially interested, tho I doubt that he ever tried it.

Baseball has invaded England now in good earnest, and the people there are going by thousands to see the matches. Cricket wanes week by week and baseball waxes. It is bound to win.

The cricketers' last defense is that cricket is a more scientific game than baseball, but that is quite untenable. The batsman in cricket can exercise a good deal of science and diversify his play considerably, but he handles an implement with a larger striking surface than the baseball batter and deals with a much slower ball. In pitching, as compared with bowling and in fielding, baseball is immeasurably ahead.

Sometimes an outfielder chasing a high fly that is going over his head runs forty yards and reaching out his hands catches the ball with his back turned to the direction from which it came. It is not uncommon to see a fielder run a hundred feet, launch himself like a spear along the ground with one hand far outstretched and seize the ball, that has come a hundred and fifty yards, before it can touch the earth.

There is great science in throwing in from the outfield, because of the force and accuracy necessary; there is science in base-running and sliding. The "hook slide," for instance, where a man comes to the home plate on his hip, presenting only his foot for the possible touch of the ball in the catcher's hands—that is a work of thought and erudition.

But baseball science reaches its climax in the pitching. There's nothing in any other game comparable with the wonders accomplished there. The pitcher takes a sphere, makes it travel in a right line for fifty feet and then make a violent curve outward or inward, according to the twist he puts upon it. This is the thing that the scientists declared to be impossible, because of the nature of the sphere and the constitution of air. Yet the pitchers are doing it every day, with every ball they deliver, and the scientists have to guess again.

From the pitcher's box to the batter's stand is sixty feet; the pitcher can send the ball so that it travels fifty-seven feet

straight, then shoots aside or drops at so sharp an angle that in the remaining three feet it drops or turns aside two feet.

As to batting, that's an art and a great art; a man needs swiftness, strength, cool head, good eyes, daring and some indescribable qualities that have not yet been analyzed. The true batsman is born; we can't make him. Training may produce the others, but not the batsman.

The Duke of Wellington once said that the battle of Waterloo was won on the English cricket-fields. He knew, and if his saying was true what must baseball be doing for this country? The players number millions when all the schoolboys, little and big, are counted in, and even if all except the professional and semi-professional are excluded from the reckoning there is still a great army left. At the top are the players of the National League and the American League, the stars, the great men, the best that the country has been able to produce with all its toiling at baseball.

Immediately under these come a host of minor leagues: The American Association, the California League, Western League, New York State League, Southern League, South Atlantic League, Texas League, Northwestern League, Central League, Three I's League, Connecticut State League, Missouri Valley League and a lot of others. All the clubs in these leagues have regular salary lists and their men play every day. Their salaries are regulated by the standing of the league, for all the subordinate leagues are classified from A down.

Under these professional leagues is a host of semi-professional, whose men play perhaps twice a week and receive five or ten dollars a game, according to their ability. The players are frequently employed in offices and factories, and their employers allow them to go when their presence is necessary on the ball field. Between the two occupations they make a good living.

Then there are the amateurs, including the college players.

Players come into the big leagues after a long, hard apprenticeship. All the way from the schoolboy at the bottom to the expert at the top the process of elimination is going on — the struggle for the survival of the fittest. It is probable that 500,000 boys today have the ambition to rise to the top in professional baseball and blaze upon the world another Rusie or Roger Conner, "Buck" Ewing or Pop Anson. Some lose the notion at sight of higher prizes, some weaken and are found wanting; only a few get thru and they are the pick of the pick.

The big leagues control the minor leagues for baseball purposes. That is, they classify the minor leagues and make rules to govern their relations; and the league, club or man that doesn't obey is excommunicated with bell, book and candle—banished to outer darkness, to the company of dogs and sorcerers—and the dogs bark at them.

Before a young man wins up to Class D in the minor leagues he must have shown great ability as a baseball player; and above that climbing requires tooth and nail. It's like winning promotion in the army during peace time. Below Class A the hopes of the baseball aspirants are moderate, but once in the upper class of the minor league the player tingles with anticipation. He is so near the top now.

The two big leagues keep their eyes on the minor leagues, especially on Class A, their great recruiting ground. If one of the big league clubs sees a likely man in Class A all it has to do is to lift a finger; he must come—and he comes jumping. The club that calls him pays the minor league $1,000 for a Class A man, or a smaller sum if he happens to be purchased from a lower class league.

Even when a man has won thru all the classes up to the top he is not absolutely incorporated into the big team, but is trained and tried and put on probation. If he suits he is fitted in; if he fails to suit he is passed on to some other club that is willing to take him, or else is returned to the league from which he came.

As to the question "Is it worth while?" looked at from the business standpoint, the answer ought to be "yes." Baseball is good business if a man is successful. The salaries range from $2,500 to $6,000, some higher. Willie Keeler, who is a grand batsman and a great man in all departments of the game, receives $8,000, so they say, and Lajoie, of Cleveland,

who for the last four years has led the American League in batting, $9,000—this for six months' work. Most of the players save money.

There's nothing in baseball that wears men out and kills them. Of course if they dissipate they don't last long; but few dissipate. The penalties are heavy. If a man turns up at the grounds unfit to play he may be fined $50 and suspended without pay for ten days; and hardy as baseball players are in other respects their pockets are very sensitive and loss of salary causes extreme anguish. So as a general rule they keep straight.

As to injuries the worst happen among amateurs; the few deaths that are caused are mostly from a pitched ball striking a man in the head. Deaths among the professionals are sometimes caused by two outfielders colliding while trying to catch a ball, but that is rare. About the worst thing that happens to us is the sprained ankle. We get that sometimes from the corks of our shoes catching while we are sliding or from a stumble or twist in running or from a wrench given by getting ready to slide and then pulling up. Such a sprain lays a man up for from four to six weeks; a split hand, tho painful, is not so serious, and a man gets back on the game again in two weeks. Stiffness of the muscles in any limb—"Charley horses," we call them—are not so serious, but rheumatism takes its toll of us full measure.

Coming up from the South in the springtime we run into all sorts of rough, raw weather; and, violent exertion opening our pores, we are made very susceptible to colds. I got cold in the "crazy-bone," as it is called, and treated it by soaking the elbow in hot water. Then without putting the arm in cold water to close the pores, I went out and sat on the player's bench, and the result was a beautiful case of rheumatism that lasted ten weeks.

But so far as the players' salaries go these injuries are not misfortunes. The salaries run on while the man is laid up so long as his injury or his illness are the result of his service.

Some men like Pop Anson, of the Chicago, can stay at the top in baseball for twenty years. I've been a professional ball player for fifteen years, tho I'm a doctor of dentistry. Daly has been a long time in the big leagues; Pat Donovan has been at the top for fifteen years; Clark Griffith, the pitcher, twelve or fourteen years, and many others from ten to twenty years.

But when the old ball player has done with the game that does not mean that he has done with the world. When I have fielded my last ball I will practice dentistry.

The old players who have long retired are in all sorts of business. Some are lawyers, like Johnny Ward and Dave Fultz; some physicians, like Dr. Gunning; Amos Rusie is working in a lumber yard in Vincennes, Indiana; Mike Sullivan was on the Governor's staff in Boston till he died; Charley Ganzell, the Boston's old catcher, is a traveling salesman; Jim O'Rourke, formerly of the New Yorks, is playing ball today. He owns his own club and grounds, and has a son playing on the same team with him—Connecticut State League. Roger O'Conner, the New York's old catcher, is a large property owner in Cincinnati; "Buck" Ewing is in business in Cincinnati. People who remember Arlie Latham will be glad to learn his fate. Arlie was one of the greatest kickers ever seen, the leader of riots and plague of umpires. So they've made him an umpire, and crowds now daily heap contumely upon him.

I think interest in baseball is going up. We get crowds of 25,000 on great occasions, tho the crowds are limited by the fact that all the seats must be back of the foul lines, while the Romans circled them all the way round the Hippodrome.

And it is a good thing for the country that baseball has such a grip. Its influence is all for good. A ball player must be an athlete and an athlete must be temperate.

The Conservative Bryan

BY ALBERT WATKINS

[Mr. Watkins, living in Lincoln, Neb., was one of the Democrats who refused to follow Mr. Bryan in 1896, and he took a prominent part in the Democratic revolt which supported Palmer and Buckner. He is editor of the Lincoln *Democrat*, and wrote for THE INDEPENDENT a study of Bryan during the campaign of 1900. He is one of the conservative Democrats who are now returning to Mr. Bryan.—EDITOR.]

WHY are so many conservative Democrats—some of them reactionists—who violently opposed Mr. Bryan's candidacy for President in 1896, and mildly, at least, in 1900, now putting him forward for 1908? Is it because he is relatively more conservative than some probable or possible alternative Democratic candidate, Mr. Hearst, for example, or some probable or possible Republican candidate, Mr. Roosevelt, for example? Or is it because these whilom opponents, now proponents, have discovered in Mr. Bryan a conservative vein hitherto unsuspected?

Both of these suggestions go toward accounting for the change in question, but they have the co-operative stimulus and motive of the excitant, natural hope of again winning victory under the old party flag, thru Bryan's apparent availability and of furthering the fortunes of some still surviving old Democratic issues, such as tariff reform.

The proposition that the radical of yesterday is the conservative of today is not only a truism, but a very trite one. It is merely a statement of the eternal rule of social progress. To recognize the principle or fact of constantly accelerated progress, due to facilitating intelligence and popular self-confidence, we should rather say that whereas the radicalism of the last century is conservatism in this, radicalism of the last decade is conservatism in this.

But I have to do with the vein of conservatism, heretofore neglected by conservative, but suspected and feared by radical estimates of Mr. Bryan.

If I am at all apt at discernment, few are as well fitted as I to answer my question. I witnessed Mr. Bryan's political unfolding at close range; at first in cordial co-operation and then, after he forced the silver issue upon the Democrats of Nebraska, in 1891, in no less cordial hostility, until its ghost was laid by the logic of economic events. In those elder days—but very youthful as touching Mr. Bryan—Nebraska Democracy was simon-pure. Perennially destitute of perquisite it perforce subsisted solely on principle. No hope of local success tempted it to temporize with tenets, and its platforms were diamond-cut. It did not stand for inarticulate and uncertain "tariff reform," but for unmistakable free trade or clean-cut tariff for revenue only. (My own Nebraska hand inserted that drastic dogma in the Indianapolis platform of 1896.) One of its factions was the first to declare for a single gold standard, and the other first *and* last and unremittingly demanded 16 to 1 free silver. It was of no earthly consequence in the eyes of the outside Democratic world except over in each Olympiad, when its votes would count for 16 in national conventions. Its most materialistic regimen was hope, long deferred, for the honors and emoluments of national success. In Nebraska, therefore:

An important method of interpreting the meaning of laws is to ascertain the circumstances in which they were made and particularly the intent of their makers. Mr. Bryan was cradled in democratic environment, when Jeffersonian democracy, originally the radical party—the party of the day—had become the conservative party—the party of yesterday. Politically, Mr. Bryan was raised on yesterday's milk. As he is thoroly human, subject to social laws, notwithstanding the contrary belief of his many devotees, the virtue of this pabulum is part of his political tissue. This basic democratic sentiment or instinct abides in him because he has reverent regard for precedent and the past. He holds

fast to this regard for democratic tradition thru the same promptings which, spite of the "seven devils of secularity," the wreck of rituals and the crush of creeds, bind him with measurable orthodoxy to the Presbyterian Church, in which his early religious bias was shaped.

Naturally and emphatically democratic in spirit, Mr. Bryan has always been sensitive to social inequality, inequity and injustice; and so, thru the force of his oratorical temperament, he has become the prophet and mouthpiece of reform. But perceiving that in present complex social conditions Jeffersonian ends, which at the outset he made his own, cannot be reached by the Jeffersonian means of hands off, or under the Jefferson theory that the government is best which governs least, but only by the opposite method of hands on, of complex interference and control, he anticipated Mr. Roosevelt in espousing the anti-Jeffersonian method or reform. In Jefferson's day, when there was ample room for everybody to move on and away from the attempted tyranny of capitalism, Jefferson's system was ideal. Under the crowded, congested system of today it would create an ideal paradise for capitalism. With characteristic boldness Mr. Bryan appealed to anti-Jeffersonian complex machinery to restore and protect Jeffersonian equity.

There was a good deal of prescience behind Jefferson's desire that agriculture should be the all-important industry in this country, because he feared the tyranny and immorality of "business." The radicalism of Bryan and Roosevelt and their greatly preponderant following consists of the principle of governmental control of monopolistic industries which Jefferson dreaded. But since radicalism is a relative term, a principle which all leading governments are forwarding should scarcely be called radical. From the beginning of his new departure, Mr. Bryan has insisted that his primary motive in advocating governmental control of monopolistic industries has been to secure the freest play practicable for competition and individual acquisition of property. He is essentially and instinctively an individualist. He stands rigidly for all the individualism that it is practicable to conserve. He is one of the leaders of the world movement toward that measure or degree of socialism which is necessary to defend and preserve in an increasingly complex society, the largest practical degree of individualism. This is not a change of principle, but of procedure. Socialism is a proper and convenient name for the progressive control of monopolistic institutions, and the prejudice against it might be advantageously dropped. Socialism in its present manifestation does not generally include communistic control of property and production, and in that sense it is neither an issue nor a menace. One of the professed aims of the socialistic movement—led by Roosevelt and Bryan—is to avoid general communistic socialism.

The continuity of this radical or socialistic movement seems certain, and the practical question involved is one of degree and not of kind—How rapidly and how far? This leads to the suggestion that those Democrats who think that they are more conservative than Mr. Bryan are supporting him by virtue of an unexpressed feeling that the inevitable advance into the field of socialism would be more safely led by an instinctively individualistic, Jeffersonian Democrat than by a Republican unrestrained by such traditions and principles and more apt to be pushed to much greater lengths by the excitant opportunism which characterizes his party.

In brief, Mr. Bryan takes his radicalism too seriously. He is not as radical as he himself has been led to think he is, or as the public has come to think he is, under the excitation of the present electrical progressiveness.

It is insisted that Mr. Bryan's radical championship of free silver stamped him as an absolute, all-round radical. But that incident was an episode of the most impressionable period of his life. Moreover, not only was the man crass, but the time was crass; and the man and the hour met. I doubt that the man would take a like course under like temptation in his present ripe stage or state.

LINCOLN, NEB.

One Team and a Cow

BY INEZ A. GODMAN

[This article may well be included among our Life Stories of Undistinguished Americans. It shows how a woman can break out a new path for herself.—EDITOR.]

WE were returning to our summer home after an absence of three years. As the train drew into the station I sighed within myself to think of our dependence upon the only livery stable of the little village. We lived more than a mile from the post office and stores and kept no horse. This meant much hiring of teams, and liverymen are so prone to vulgarity and profanity. I wonder why it is that the company of horses seems to degrade mankind; surely it ought not so to be.

As I stepped from the train a tidy little woman accosted me with a bright smile.

"Shall I drive you down?"

I looked at her amazed. She flushed and stepped back. "I have a team and thought perhaps——"

"Of course," I hastened to reply, while the liveryman scowled. "Will you take the checks also?"

She assented gladly, and a moment later I was scanning her trim profile as we sped along behind her big sleek horse.

"Please," I said, "have you really opened a livery?"

"I have."

"Well, well, how good that is! Do you like it? How did you begin? Is it profitable? Please tell me all about it."

"Well, at first I just accommodated my neighbors by bringing them to the depot. I had a team, and it was not easy to get word to the livery from our part of town. Of course, my lord of the livery did not like it, and he was not slow in showing his displeasure; but his opposition only aroused my determination, and I became more obliging to my neighbors than before. They offered then to pay me and I accepted, thereby getting a little spending money and seeing a bit of light on my problem."

"What problem?" I demanded.

"Oh, I beg your pardon. It is with me so constantly that I think every one must see it. Simply this: How to increase my income in this little country village. You see, my father and mother live with us, and my husband's business does not pay well enough to support us comfortably, and our son wants to go to college. Even if my husband's business had increased and brought in an adequate income, I doubt if I would have been satisfied. I wanted to bring in some money myself; it is *my* father and mother; not *his*.

"As things are now, my mother looks after the housekeeping, my father makes us a good garden, and I bring in money enough to run the household; and this fall our son is going to college. Yes, it has been a success, but I am sure I never would have found courage to really open a livery except for a little incident that roused my ire and urged me on.

"Once upon a time, when I went to the depot for a friend, one of the livery teams drove into my buggy and smashed a wheel. The driver might have been sober and he might not; one cannot always tell as to a liveryman. However, I did not wait to ascertain, but loosened my horse from the shattered buggy, trotted him to the livery stable, hitched him to the first carriage I found, and returned to the depot just in time for the train."

"That was plucky!" I said.

She laughed.

"So my friends say, but neither my lord of the livery nor his men offered any apology for wrecking my buggy, did not even come to my assistance, tho witnessing the catastrophe. Neither made he any remark at my appropriating his carriage without leave or license. The chief result of this little incident was such an amazing increase of my courage that I sold a cow, bought another carriage, and

opened a livery. There are many summer cottages near me, and I soon absorbed their business and some also from other parts of the town."

"That must have been a serious matter to the regular livery."

"It would have been, but you know we have blossomed forth into a summer resort lately, so that there is business enough for both of us."

"Don't your friends object?"

"Yes, somewhat. One good friend of mine frowned at me over his glasses: 'My dear Mrs. Francis, how can a *woman* run a livery? It is a—well—rough, low business; and the men are so profane.'

"But that is just the beauty of my livery. My dear old horses are never sworn at, and the boys who serve in my stable do not drink liquor. My own son, who is my right hand in the business, does not smoke at all, and neither he nor I understand why the companionship of good horses should lead men to profanity and vulgarity.

"I feel proud of the atmosphere about my stable, and proud that mothers who are careful of their sons seem anxious to entrust them to me when they would not dream of allowing them in an ordinary livery. Boys are generally fond of horses, the out-of-door life is healthful, and I see no reason why the livery business should be considered a degrading occupation.

"Of course, there are unpleasantnesses. I am sometimes discouraged and disgusted and threaten to quit, but I need the money and know no other way in which I could make it more easily. Despite all the trials the business is a good one. I am out of doors twelve hours a day in summer and at least four in winter. As a result of this I have not been sick since I began, and I never feel shut in as I used to during the long winter. I am always meeting new people.

"As to the profits I cannot give you a detailed statement of expenditures and savings, but I can tell you what I have done these five years: I have with my earnings paid all of the household expenses, including the board of five boys during the summer season."

"Your mother does the housekeeping?"

"Yes, and this year I have hired a maid to help her."

"Well, to pay all one's daily living expenses is considered a success in this world."

"But I have done more than that. I had no capital to begin with but one team and a cow, and I have now eight horses and carriages beside an omnibus."

"All bought from your profits?"

"All bought from my profits, and I have saved a tidy sum every year besides. Last year I had enough to enlarge our house so as to make room for the boys in summer, but it was absorbed by a lawsuit.

"Of course, a lawsuit is an expensive luxury, and I have endeavored to keep free from such entanglements, but this one burst right out of a clear sky upon my head.

"A woman who had hired one of my outfits drove into another team, overturned it, and got herself badly bruised. Instead of offering to pay damages for my wrcked carriage she repudiated her whole summer's bill and sued me for damages, alleging that I had given her an unsafe horse. The horse was not unsafe and did not run away, but it cost me some dollars to prove it, and we must endure being squeezed for another summer. However, the lawsuit did me good in a way; it brought my business before the public, and I have bought four new horses and carriages this season."

"Do you lose much on horses and vehicles?"

"I have as yet lost nothing on horses. I buy young, sound animals and take good care of them. They are never fed when heated or allowed to stand uncovered on a cool day. I watch every day for symptoms of trouble and hire the best veterinary when they are sick. I never go to bed until every horse is in for the night and I have looked him over.

"With teams it is different. I am always paying something out for repairs. The boys drive roughly, and hardly a week passes during the busy season without broken shafts or wrenched wheels. Last summer I had a surrey smashed by a train at a crossing on a dark night and my son's arm was broken at the same time. I was so thankful for his life that I did not grieve over the surrey, but I am often vexed at my repair bills."

"There are other expenses?"

"Oh, yes. The hire of the boys, feed-

ing and shoeing the horses, and other supplies such as blankets, robes and harnesses—I have bought six new harnesses this season."

"Can you tell me just how much it costs to keep a horse?"

"No, I cannot. We have eight acres of hay land, beside two meadows—one salt and one fresh. I have so far had to buy very little hay or bedding. We raise some corn, and in winter I feed both the ear and stalks. I buy oats at wholesale at about one dollar a sack (two and one-half bushels) and feed twelve quarts a day to each horse during the summer. In winter, when the horses are idle, I feed very little oats. I have been fortunate in finding good homes for several of my horses in winter where their services pay for their keep. This is a great help, as feeding so many idle horses during the long winter keeps down my profits."

"Are your horses entirely idle in winter?"

"Well, there is really nothing to do, but I meet every train, because it is a part of the business and the exercise is good for the horses."

"Would you advise other women to try the livery business?"

"Certainly, if opportunity offered and they loved horses. Every one of my big, sleek horses is a delight to me, and to hold the lines over their backs is always a pleasure. To be sure it hurts me to let every Tom, Dick and Harry drive them, but I will say, to the credit of my fellow beings, that I seldom find unkind people among my patrons. I have sometimes to give my horses into the hands of those who know less than the horses themselves, but I try to be patient.

"At first I grew nervous over the business and slept with my watch in my hand for fear that I should miss the early train. Now I take things more calmly. Only twice in these five years has any one missed the train thru failure in my service, and then it was the fault of green, careless boys whom I had pressed into service in an emergency."

"I Have Eight Teams Now and an Omnibus."

"But, Mrs. Francis, what about your husband?"

"Oh, my husband! Why, he don't like my venture very well. He wants me to take boarders. However, I prefer doing this, there is more money in it, I think, and he does not object very strenuously."

"Does he help you any?"

"Sometimes, but he is a house painter, not a liveryman, and he don't like horses."

I did not wonder at her preferring the driving along the surf-bordered road to the stuffy heat of a boarding house kitchen, and as we drew up to our own steps I commended her choice.

"And may I have your trade?" she asked.

"You certainly may. I shall be delighted to be rid of tipsy drivers and lame horses."

Her face sobered. "It does not seem necessary to me," she said, "that a livery should be vulgar. I think that if women took up the business it would soon become as respectable and wholesome as a candy shop, and it certainly is more healthful."

I have watched our little livery woman all summer. She is as busy as a whole hive full of bees, and her face is as cheery as the sunlight. I have to catch her at the depot and corner her to get my questions answered.

"Are you having a good season?" was the last one.

"Fine. I have bought four new horses and carriages and they are going all the time. If nothing happens the boy shall enter college this fall, and perhaps I'll get my house enlarged, too."

The train whistled and she sped down the platform.

I entered one of her carriages, and gazing at the long line of her teams thought, "All this from one team and a cow."

Tunk: a Lecture on Education

BY JAMES W. JOHNSON

Look heah, Tunk!—Now, ain't dis awful! T'ought I sont you off to school.
Don't you know dat you is growin' up to be a reg'lah fool?

Whah's dem books dat I's done bought you? Look heah, boy, you tell me quick,
Whah's dat Webster blue-back spellah an' dat bran new 'rifmatic?

W'ile I'm t'inkin' you is lahnin' in de school, why bless ma soul!
You off in de woods a-playin. 'Can't you do like you is tole?

Boy, I tell you, it's jes scan'lous d'way dat you is goin' on.
An' you sholy go'n be sorry, jes as true as you is bo'n.

Heah I'm tryin' hard to raise you as a credit to dis race,
An' you tryin' heap much harder fo' to grow up in disgrace.

Dese de days w'en men don't git up to de top by hooks an' crooks;
Tell you now, dey's got to git der standin' on a pile o' books.

W'en you sees a dahky goin' to de fiel' as soon as light,
Followin' a mule across it f'om de mawnin' tel de night,

Woikin all his life fo' vittles, hoein' 'tween de cott'n rows,
W'en he knocks off ole an' tiah'd, ownin' nut'n but his clo'es,

You kin put it down to ignunce, aftah all what's done an' said;
You kin bet dat dat same dahky ain't got nut'n in his head.

Ain't you seed dem w'ite men set'n in der awfice? Don't you know
Dey goes der 'bout nine each mawnin? Bless yo' soul, dey's out by fo'.

Dey jes does a little writin'; does dat by some easy means;
Gals jes set an' play pianah on dem printin'-press muchines.

Chile, dem men knows how to figgah, how to use dat little pen,
An' dey knows dat blue-back spellah f'om beginnin' to de en'.

Dat's de 'fect of education; dat's de t'ing what's gwine to rule;
Git dem books, you lazy rascal! Git back to yo' place in school!

New York City.

The Last Days of the Duma

BY OUR REPRESENTATIVE IN RUSSIA

JULY 22d, the day on which the Emperor Nicholas II closed the Duma, is a date that Russia will long have cause to remember. "The closing of the Duma," says the *Ryech,* the organ of the Kadets, "is a stupendous fact whose importance it would be difficult to overestimate, whose consequences it would be difficult to foresee." This paper, always so cautious, almost conservative, despairs of the salvation of the country by constitutional means. "The Duma," it says in conclusion, "was always able to restrain the people. Who will restrain the people now?"

The *Twentieth Century* says that the Government has, by its action, suddenly and enormously accelerated the march of events. All the papers in the capital are pessimistic, all save the bureaucratic *Novoe Vremya.*

No wonder the most far-sighted observers fail to see a ray of hope. Some foreigners may see hope in the Tsar himself, but nobody in Russia does, and the wonder is that this weak and vacillating young man, who sheds tears for his people today and shoots them down tomorrow, whose advisers are alternately ecclesiastical anachronisms, like Pobiedonostsef and quack spiritualists like Philippe, should ever have inspired anybody with confidence. As a matter of fact, he deserves as little credit for the manifesto of October 17th as King John of England deserves for Magna Charta. That manifesto was wrung from him by the discontent of his people and by his failure in the war with Japan. Then he summoned a Parliament. His bureaucrats did all they could to have only "safe" persons elected to that Parliament, which the Tsar himself formally opened and addressed as "Russia's best." When, however, these representatives of the nation respectfully advised their sovereign to do things which were personally distasteful to him, but which were necessary to save the people from ruin, that obstinate young man got peevish and manifested his peevishness in a way that one might expect of a spoilt child, but could hardly expect of an Emperor. He summoned the President of the Duma to his birthday celebrations in order to elaborately insult him by ordering his carriage long before that of any other guest. He tried to make the Duma send its communications to him thru some flunkey or other by the tradesman's entrance, and when the Duma insisted on doing solid work for the peasants, instead of confining itself to drawing its salary, the Tsar dissolved it.

The Emperor of Russia and the Tchinovniks of which he is the chief have therefore put themselves in deliberate opposition to the almost unanimous voice of the people. With a famine coming on in nine governments, with the troops discontented, with the peasants in open revolt, with towns and manor houses blazing from the Volga to the Vistula, it is a bold step to take—no, the world "bold" is out of place here, for it is the act of a maniac.

That act has stripped from the Tsar his last rag of prestige. "Little Father!" "God's anointed!" The very *muzhiks* spit with contempt when they use these words. "But he'll give you another Duma in February next. He has promised to do so," said I to one old farmer, who interrupted me with a rather impolite expression of incredulity, adding: "Oh, Colly will change his mind about that, too." ("Colly" is a familiar contraction for Nicholas.)

The dissolution might not have come so soon had it not been for an appeal to the people on the agrarian question which the Duma passed on Thursday, July 19th. Strange to say, this appeal was suggested, not by some revolutionary Deputy, but by Mr. Kuzmin-Karavaeff, an officer and a Conservative, for he belongs to "the Party of Democratic Reform," a party which is less liberal than the Kadets. It was on the 9th of July that Mr. Kuzmin-Karavaeff proposed this appeal. He did so because the Government had first appealed directly

to the people over the heads of the people's representatives. In other words, the Government was not observing the laws which it had itself drawn up and which it had made as little favorable to the Duma as possible. It was playing a game of "heads I win, tails you lose" with the representatives of the nation.

Mr. Kuzmin-Karavaeff's suggestion was referred to a commission, but then the Labor party introduced an appeal of their own which was a trifle stronger than the Kadets' appeal. In fact, about the only difference between the two at the outset was that the Kadets advised the peasantry to refrain from violence and wait patiently, while the Labor group abstained from giving any such advice.

All day on the 19th and till 10 past 2 on the morning of the 20th the Kadets and Laborists discussed this question, the latter making their appeal stronger as they went along; the former making theirs milder until it was very mild indeed. Thilkin, the Labor leader, said he wanted to tell the people frankly that all was vain. The Duma was a sham, for the Government would not heed any of its suggestions, would not pay the slightest attention to it. It is treacherous of us, said he, to leave our constituents under the impression that we are working for them, when, as a matter of fact, we are only making ropes out of sea-sand. To this Mr. Petrunkevitch replied in an optimistic and eloquent speech, in which he insisted on the vitally important position which the Duma occupied. To issue your manifesto, said he, to the Labor men, would be a cowardly step, for it is equivalent to sending the nation against the bayonets and machine guns of the soldiers while we are sitting here in safety. Finally, the Kadets' version was passed by 124 votes to 53, 101 members refraining from voting. Oddly enough, however, the Duma did not decide on how they would publish their appeal. It was suggested that it be sent to the *Official Messenger,* altho everybody must have known that the *Official Messenger* would never print it. On Saturday the Kadets were bitterly blamed for having given way so much under the threats of the Government. For, on Thursday and Friday, troops were being hurried into St. Petersburg. From the camps in the neighborhood of the capital and from all the garrison towns within fifty miles of it, regiments were hastily dispatched until 22,000 men were concentrated. The Czar was, meanwhile, presiding at Peterhof over a council which was principally composed of police and army leaders, and in which the notorious Pobiedonostsef, late Procurator of the Holy Synod, and General Trepoff, the Military Governor of the capital, occupied prominent positions. Goremykin, the Prime Minister, was in constant telephonic communication with the Duma, and if that assembly had sent its "appeal" to the newspapers on Thursday night he would have surrounded every newspaper office in St. Petersburg with troops, and prevented any paper from appearing.

Altho, on Friday last, the Duma turned its attention to other things, the proceedings of the day before are the sole subject of discussion in the lobbies. Owing to the heavy rain clouds which covered the sky the electric lights had to be turned on at an early hour, and this extraordinary measure—I say "extraordinary," as this time of the year there is practically no night in Russia—combined with the excitement of the deputies to fill one with a feeling of vague apprehension. But none of us felt that it was the Duma's last day, and the last words uttered from the tribune, at half-past seven in the afternoon, were a brief reminder from Mr. Vinaver that the Bielostok massacres would have come up for discussion on Monday. But on Sunday, the presence of the Tsarskoe-Selo hussars and dragoons on the Nevsky and the strong guards on the streets and at the railway stations showed us that something extraordinary had happened. The blow had fallen.

ST. PETERSBURG.

The Fourteenth Interparliamentary Conference

BY HAYNE DAVIS

Secretary to the American Delegation.

THE Fourteenth Conference of the Interparliamentary Union, just closed, was the most important in the history of this unique organization. It was the largest in the number of Parliaments represented, in the number of persons present, in their weight of political influence at home, and it was the most progressive, both in the propositions put forward and the resolutions which were adopted.

The Union now contains over 2,000 members, all of whom have seats in some national Parliament. Ordinarily speaking, only about ten per cent. of these members attend the Conferences; as there were considerably more than 500 present at this session, the attendance was very unusual, and these parliamentarians came from twenty-three different nations. At the session held in the United States during the year 1904, only fifteen countries were represented, and the number of delegates did not exceed 200, or 250 at most. The large attendance at the present Conference was due in a great measure to the importance of the propositions which were to come up for consideration. Those who have followed carefully the events of the past two years in international politics will not need to be reminded that the Second Hague Conference was called as a result of the resolution adopted by this Union at its session at St. Louis in September, 1904, and that Mr. Bartholdt, as president of the American delegation, at the Brussels Conference proposed the founding of a permanent international deliberative body, having the right to assemble periodically and automatically, and the granting of jurisdiction to the Hague Court over such questions as the different nations can obtain their own consent to arbitrate, instead of resorting to trial by armed forces. The reports of the two Commissions in favor of these propositions excited great interest in this London session, among all the members of the Union in all the countries of Europe.

Not only does the membership of the Conference which has just closed here far exceed that of any former session, but the influence of the leading members in their own countries is greater than ever before. The French group was headed by Baron d'Estournelles de Constant, the eminent French Senator, who is now a member of the Hague Court for France, and who was a member for France at the first Hague Conference. Baron d'Estournelles is recognized all over Europe and America as one of the foremost statesmen of our times. He was a member of the Commission on the International Congress. Count Albert Apponyi, of Hungary, is also a member of the Hague Court, and is Minister of Education in the new Hungarian Cabinet, which is now engaged in the most difficult piece of constructive political work which is being done in Europe. The Commission on Arbitration Treaty was headed by His Excellency Ernst von Plener, ex-Minister of Finance in the Cabinet of Austria, and for many years the leader of the German—which is the predominant—party in the Austrian Imperial Parliament. At the head of the Belgian delegation was the ex-Prime Minister, Burnaert.

Turning from Europe to America, the personnel of the delegation is found to be relatively even more influential than at former Conferences. The United States Congress has been represented at only seven of the fourteen Conferences of the Interparliamentary Union, and at several others by only a single member.

American Congressmen became acquainted with the Interparliamentary Union thru its action in visiting America and in causing the second Hague Conference to be convened. The result

was seventeen members of the United States Congress appeared at its 1905 session held at Brussels. The importance of the propositions put forward at that time has resulted in bringing to this Conference at London as large and a considerably more influential delegation than that which represented the United States Congress at the St. Louis session. Heretofore the Democratic side of the delegation has been small and relatively less influential than the Republican. At this Conference the Democratic membership of the delegation is as large as the Republican, and comes nearer representing the head of the Democratic party than the Republican side does. For John S. Williams, the Democratic leader of the House, is a member of the delegation, and so is W. J. Bryan, who has twice been Democratic candidate for the Presidency. Mr. Williams being the leader of the Democratic party in the House of Representatives, and Mr. Bryan being the leader of the Democratic party in the country, the only thing needed to make the Democratic side of the delegation as strong and as representative as would be possible, was the presence of Joseph W. Bailey, of Texas, Democratic leader of the Senate. On the other hand, the leading Republicans at this Conference are Richard Bartholdt, of St. Louis, and Theodore E. Burton, of Ohio. But as both of them are very strong men, and as there was absolute unity between them and the Democratic leaders who were present at this great Conference, it is plain that the United States was never before so strongly represented at a session of the Interparliamentary Union.

The main points of the program at the opening session of this Conference were the report of the Commission in favor of converting the Second Hague Conference into a permanent body to convene periodically and upon its own motion; second, in favor of the codification of the law of nations, and, third, for the granting of jurisdiction to international courts of arbitration, for such classes of controversies as are included in treaties of arbitration. But immediately upon the opening of the Conference a large number of resolutions of considerable importance were introduced.

At the meeting of the American delegation, which was held the day before the conference was opened, it was unanimously decided, upon motion of Mr. Burton, that the American delegation should vote solidly in favor of both the reports advocating the adoption, with slight modifications, of the original proposition put forward by Mr. Bartholdt at the Brussels Conference. But Mr. John S. Williams proposed that one of these reports should be amended so as to include in the questions to be arbitrated "all questions of debt." Mr. Bartholdt's original proposition had included "pecuniary claims," which, of course, would cover questions of debt, and might possibly be even more comprehensive than the wording of Mr. Williams's resolution. The Commission had eliminated this clause in drawing up what they considered the best possible treaty, having good hope of general acceptance at this time. The American delegation voted unanimously in favor of sustaining Mr. Williams in standing for the insertion of questions of debt into the proposed Treaty of Arbitration, and this motion was carried in the Conference without opposition. Mr. Williams moved also that the Interparliamentary Conference should declare in favor of the payment of a salary to all the members of the Hague Court, and in favor of a graduated appropriation, proportionate to the population of each country, for enabling the Hague Court to codify the law of nations and to keep properly open and operative a clerical force at the Hague, for the transaction of such business as might come before the Hague Tribunal.

Satisfied that the reports of the Commission on his resolution introduced at Brussels would be adopted, Mr. Bartholdt presented a resolution in favor of a declaration by the Conference, that the several nations whose parliaments are represented in the Interparliamentary Union should make appropriations in aid of the work now being prosecuted by the Interparliamentary Union.

Mr. Burton proposed to introduce a resolution in favor of suggesting that the Second Hague Conference should consider, and, if possible, devise a means of effecting an arrest and then a decrease of armaments. All of these propositions

were unanimously approved by the American delegates, and the members of the delegation were instructed to vote as a unit for all of them.

It was found impossible, in the pressure of business during the three short sessions, to get all the matters brought up for consideration. Mr. Bartholdt's motion in favor of national appropriations in aid of international arbitration met with some opposition in the Executive Council, but was passed enthusiastically when it came before the Conference in full session. Mr. Williams's motion in favor of the payment of fixed salaries to the members of the Hague Court, coupled with a prohibition against their appearing as counsel in any case before this court, could not come up for consideration, but the fact that it was presented by a parliamentarian of such ability and of such a commanding position in the Congress of the United States was itself a fact of considerable importance. This resolution will doubtless be pressed by Mr. Williams at the next session of the Union, and it commends itself so forcibly to the intelligence of the leading members at this Conference that its adoption at an early session is practically assured.

For a couple of years Mr. Bryan has been giving consideration to the question of an international agreement binding the signatory powers to arbitrate all questions of fact, even tho the right is reserved by the arbitral agreement to appeal from the decision of the court to the battlefield in those questions which are considered as affecting the vital interest or the honor of the parties to the dispute. Upon several occasions Mr. Bryan had already expressed himself as favoring such an agreement. And when he received an invitation from the president and secretary of the British group to attend the present session of the Interparliamentary Conference, he decided to make a motion in favor of the endorsement of this idea by the Union. He was not aware of the fact that Mr. Bartholdt had proposed this idea as one clause of the treaty of arbitration which he submitted at the Brussels session. When Mr. Bryan was shown a copy of the report of the committee on arbitration treaty, he decided that he would introduce this idea in the form of a motion to amend the treaty proposed by the commission. During the discussion of Mr. Bryan's amendment, the fact was brought out that his motion was practically to reinsert into the proposed treaty of arbitration one clause which had been eliminated by the commission. In a very simple but powerful address Mr. Bryan crystallized the thought of the Conference in favor of the treaty of arbitration proposed by the commission with this idea reinstated. When he finished his speech the whole Conference was a unit on the question of converting the Second Hague Conference into a permanent body, and in favor of a treaty of arbitration granting the Hague Court the right to try and finally to determine all such questions as are specified in the treaty of arbitration, and the right to try in the first instance all questions of fact, the parties being at liberty to appeal from the decision of the court in the questions not specified as arbitrable to the ancient method of trial by a force of arms.

Any one of these things would have made this Conference not only worth while, but an important factor in the progress of the world. But, in addition to these important acts of the Conference, another resolution, which is considered by some as being of equal importance, was adopted upon the motion of Baron d'Estournelles, which is as follows:

"The Interparliamentary Conference believes that the increase of naval and military expenses which already weighs heavily upon the world is universally recognized as intolerable, and therefore expresses the wish that the question of limitation of armaments be placed on the program of the forthcoming Conference at The Hague.

"The Conference decides, further, that each country taking part in the Interparliamentary Union will seize the earliest possible opportunity to bring this resolution to the attention of its Government, and to press upon the Parliament to which it belongs the idea of instituting immediately the national investigation of this question, which seems necessary to the success of an international discussion of it."

Personally, I have very much greater confidence in the success and in the value of the plan for constructing an international deliberative body, and perfecting the power and authority of the international judicial body which already exists

than I have in the results of either national or international consideration of the question of limiting or decreasing naval and military expenditures. I agree with Mr. Bartholdt that these expenses are a symptom, and that when we remove the cause the symptom will disappear, and that the cause of these armaments will be removed by the organization and proper development of an international deliberative body, supplemental to the international judiciary which we already have.

But whether the advocates of immediately proceeding to a discussion of limitation of war appropriations will be disappointed at the result obtained or not, the very passage of the resolution with such unanimity proves that the parliamentarians of the world are fully aware of the fact that the size of the world's military establishments constitutes a grave malady, and that some remedy must be found without delay. If it be found, upon examination, that the nations will refuse to limit their naval and military expenditures without some guarantees that their rights will be respected, it is very likely that this very fact will lead to an early agreement between all the nations of Europe that they will hereafter respect all those rights which it would be right to defend by force. When this is done, certainly the people of the various nations will decline to spend vast sums of money unnecessarily to preserve rights which are already safeguarded against loss by the attack of powerfully armed neighbors.

I have thus far spoken only of the acts of the Conference itself, but it would be a serious omission not to lay great emphasis upon the remarkable address of Sir Henry Campbell-Bannerman, the British Premier, in welcoming the delegates to this Conference. No Prime Minister of any country has ever gone further in advocating international arbitration than was done by Sir Henry Campbell-Bannerman in this historic address. When it is recalled that he is the Premier of not only the greatest, but of the most powerfully armed, nation in the world, it is easy to see that his declaration in favor of arbitration without restriction, and in favor of an arrest of armaments, is itself a fact of the greatest importance. In his address Mr. Bryan stated that there were a number of statements in this memorable address by the British Premier, any one of which would have made this assembly not only worth while, but very important to the progress of the world.

Count Albert Apponyi was appointed by the council to reply to the address of the British Premier, and in doing so he pointed out that this address was historic and important, not only in the sentiment which it expressed, but in the fact that it brought from the King of the country in which the Interparliamentary Union was holding this session, a message of sympathy for its aims, prior to any request by the Conference that he would take note of and give effect to these aims. Said Count Apponyi:

"Heretofore the Rulers of those countries in which our Conference has held sessions have taken no notice of our assembly until we advised them of our presence and our purposes. Now, for the first time, the Ruler of the greatest country in the world has not permitted us to have time to advise him of our presence; he has immediately assured us of his active and profound sympathy with the object which has called us together."

London, England.

Sex Morality and the Taboo of Direct Reference

BY ELSIE CLEWS PARSONS

[Mrs. Parsons, as our readers will remember, has been recently a lecturer at Barnard College in Sociology, and has always taken a deep interest in theoretical and practical social questions.—EDITOR.]

IN the onward rush of modern life we find innumerable back-eddies and whirlpools, contradictions and dubieties of thought and conduct. Contemporary morals, particularly sex morals, are especially marked with these characters of rapid transition. These more or less inevitable characters are furthermore intensified by widespread taboos of discussion, taboos precluding any popular instruction about the origin and growth of our sex morality and any intelligent consideration of the probable or desirable goals of contemporary tendencies. Not that discussion of the subject does not abound. Perhaps there is too much of it in fact; but it is so superficial, so circumvented by traditional silences, that it is inevitably fallacious or unenlightening.

As a result of these circumstances our sex morality looks and is, in many cases, insincere. Having passed out of ancestral stages of woman purchase and polygamy, for example, we condemn prostitution, and yet we refer to it, when we refer to it at all, as a "necessary evil." Why condemn it if it is necessary, or, if it is an evil, why is it necessary? If prostitution is necessary, is it not because in a very large number of individuals the monogamous instinct is undeveloped? This being the case three lines of conduct seem to be in order: (1) Systematic effort to develop the monogamous instinct in all young people, involving direct instruction about sex. (2) Provision that the monogamously inclined shall never by force of economic or other circumstance join the anti-monogamous. (3) Such supervision of the anti-monogamous, male and female, especially in the matter of infectious disease, that their ability to harm the monogamous is reduced to a minimum. If, on the other hand, prostitution is not merely to be viewed as the outcome of a lack of development on the part of a large number, but as characterizing a small number of vicious persons, then should not attempts be made to suppress it as in the case of murder or assault or pocketpicking? At least the offenders, *male* and female, should be easily recognized by the public by some special sign as were the female prostitutes of the Middle Ages. Now are any of these points ever frankly discussed? A few years ago municipal inspection of the health of female prostitutes was discussed in an organization of some of the philanthropic people of New York. The Continental system was, however, rejected on the ground that it sanctioned vice; and yet nothing further was done about the suppression of the vice in question. Recently we had a chance to consider a serious and decent dramatic presentation of the question of a resort to prostitution from starvation wages. The play was suppressed. The comment of its author on its suppression contained biting irony on the action of the New York police, police known world over for their blackmailing proclivities toward disorderly houses. An-

other form of our hypocrisy and one which is even more demoralizing perhaps, for it affects a larger number, was referred to. "Prostitution is a permissible subject on the stage only when it is made agreeable." Endless instances of the truth of this assertion will occur to any playgoer in New York. To mention a recent and particularly flagrant case, what was the whole theme of "The Girl from Kay's" but the buying of women? And yet this coarse and even vicious farce had a long, uninterrupted run.

In our rampant discussions of divorce insincerity again crops out. We arraign the symptom without considering the disease. Our sex relations in marriage are also in transition. Failure to recognize this fact, failure to realize that adjustments of marriage to modern industrial and democratic ideas are inevitable, is more than anything the source of divorce. Does not the incompatibility between the over-cultivated, leisure-class wife, self-cultivated because she has nothing else to do, and the under-cultivated and overworked husband, unresponsive to anything but "business," largely because of the elaborate scale of expenditure set by the non-productive wife, does not this incompatibility express itself in the varied forms of friction that lead to divorce?

In our no less rampant discussions of race-suicide, our failure really to get at the facts of the case has been again almost ludicrously demonstrated. The ignorance of girls about sex and maternity, the relation of race-suicide to prostitution, or to the unproductive activities of women, are rarely even referred to.

There are many other points of conduct whose popular treatment is open to the imputation of either blind morality or moral blindness. He, for example, who will some day write the history of prohibition, particularly Sunday closing and anti-canteen law and practice, with the view of distinguishing between the elements of idealism and hypocrisy, will have a hugely entertaining and enlightening task. In no other class of subjects, however, is taboo on clear and direct thinking so onerous, and perhaps in none of our moralities is failure to "think thru" so practically disastrous, as in our sex morality. There is an ethical, as well as an intellectual, obligation in seeing things as they were and are before concluding what they ought to be. The history of sex relations ought to enter in some way into the curriculum of every high school. A simple form of the study ought also to form part of the program for the compulsory "continuation classes" in physical development and home-making for grammar school graduates which were recently recommended by the English Interparliamentary Committee on Physical Deterioration, and which I hope may some day be incorporated into our own public school system.

In primitive communities taboo is a far-reaching and most effectual instrument of government and preservative of group tradition. The property of a chief, the priest-chief or divine king himself, the name of a god, the kinsman or kinswoman with whom marriage is forbidden, may not without serious consequences be approached or referred to directly. In modern civilization there are not a few survivals of taboo in out of the way mental corners, but the taboo of direct reference is perhaps the sturdiest. Interesting as it is in the history of thought we might not care to disturb it in its historical position were it not for the fact that having outgrown its usefulness it has taken on an immoral nature. Does it not foster hypocrisy? Is it not antagonistic to true idealism? We are not slow to take this point of view in almost all matters except sex morality; but here we deliberately turn our back on it. As a rule our justification takes the form of the argument that open discussion of sex morals would promote morbid—*i. e.*, disproportionate or salacious — habits of thought. Is not the reiteration of this argument somewhat brazen in the face of the commonly acknowledged facts that the forbidden is more seductive and attention-commanding than the unforbidden, and that the innuendo, the misconstruction, the *double entendre,* are far oftener in the mouths of the corrupted than of the uncorrupted?

Lenox, Mass.

Literature

An Important American Geology

In the second and third volumes of Chamberlin and Salisbury's *Geology** the expectations of teachers and students have not been disappointed. One is safe in predicting that the work as a whole will, without displacing other leading texts, be generally accepted as authoritative for years to come. It will doubtless serve, too, as a mine of information for the compilation of elementary textbooks. As a class-room text its size will forbid its extensive use, since there are but few institutions which have a place in their curricula for so full and detailed a course in geology as this work will demand. For the graduate student and as a reference work for the teacher and general reader the work is, however, indispensable.

A Group of Concretions Weathered Out from the Dakota Sandstone in Kansas.
From Chamberlain's Geology. Henry Holt & Co.

The second and third volumes, of bulky size and richly illustrated, treat exhaustively of the earth's history, its origin, development, stratigraphy and life history. Not a few theories and unsettled problems are given due space, and very properly. Of chief interest in these two volumes, perhaps, is the senior author's Planetesimal Hypothesis, here almost for the first time clearly treated and made accessible to the general reader. In a few words this hypothesis assumes that the solar system was derived from a spiral nebula of the common type; that this nebula was not, as the generally accepted Laplacian hypothesis postulates, composed of gaseous matter, but of matter in a finely divided liquid or gaseous state; that the knots seen in such nebulæ are the nuclei of future planets, the nebulous haze is composed of particles of material to be gathered in and added to the knots in the growth of the planets; and that these knots and surrounding hazy material move about the central mass in regular elliptical orbits. As a probable origin of the nebulæ—tho not affecting the general hypothesis—an early close approach of the ancestral sun to some other large body is assumed, thru the attraction of which the nebula material was thrown off from the sun.

The Laplacian hypothesis assumes that the concentration of the gaseous nebulæ first into a liquid and then into a solid state produced the earth practically com-

* Geology. *By Thomas C. Chamberlin* and *Rollie D. Salisbury*. Vols. II, III. New York: Henry Holt & Co.

plete, so far as its mass is concerned; and that it began as an intensely heated body which has ever since been cooling off. On the other hand, the planetesimal hypothesis postulates that the earth began as a nebular knot, acting as a nucleus, which has since grown to its present size by the accession of finely divided solid particles—that is, planetesimals, with a continued increase in temperature developed in the internal parts and creeping outward.

Such an hypothesis, if it receive the approbation of geologists and physicists, as seems likely, must have a profound influence on all theories of the development of the earth and its history. Under the Laplacian hypothesis life began on the earth when it was cooled sufficiently; under the alternate hypothesis life did not begin until it had grown warm. Beginning as an atmosphereless body of relatively small size the earth gradually acquired an atmosphere and a hydrosphere, with constant increase in temperature. Life under this hypothesis may have been in existence for a vastly longer time than the older and more generally adopted views would permit, answering all the demands of the geologist and evolutionist — demands that have been very grudgingly admitted by geophysicists.

Without exception the most unsatisfactory and uninteresting parts of the texts of geology at present used in our schools and colleges are those treating of the past history of life upon the globe. The teacher finds them the most difficult to present adequately and interestingly to his pupils, and the pupil, the most difficult of comprehension. Perhaps the prevalent methods of teaching biology in our high schools and colleges are really at fault for the lack of interest or appreciation of the life development of the earth on the part of the average student; certain it is that complaints have been urgent for years from teachers of geology of the inadequate preparation in biology of those students attempting the study of geology. With teachers of geology, who themselves know but little of biology, and this is the rule rather than the exception, instruction in the life development of the earth is usually uninteresting, if not actually depressing.

The authors of these volumes are in no sense biologists, and it is perhaps for this reason largely that they have, in the opinion of the reviewer, made a decided improvement in the treatment of the earth's life history. The "familiar biological roll-calling" for each period has been abandoned, and from the great mass of biological and paleontological details they have culled out the more essential principles and parts of general interest. They have dwelt especially upon the evolution of life in its broader sense: the relations of organisms to their physiographic and climatic environments, their dispersion, phylogenic lines of descent, geographic distribution, etc. A good presentation of the development of life upon the earth, from the standpoint of the biologist, remains yet to be written, and there is need for such a work; but the authors have done well not to attempt such a task here. Many fresh illustrations have made more intelligible the chief types of extinct life, obviating the necessity of recourse to obscure details. The general accuracy of the biological side is assured by the criticisms of experts in the different branches of paleontology.

Stratigraphy, the distribution of sedimental rocks, earth movements and paleogeography are treated fully, often more fully than would be desired by the general reader; as is also glaciology, which one might expect from an acquaintance with the authors' work in the past. And especially welcome are the many and excellent illustrations.

Saintsbury's English Prosody*

A DOZEN pages of review would not suffice for a thoro study of this first volume of a most careful if not monumental work. The author is Professor of English Literature at Edinburgh University, and no man is more completely familiar with early English and contemporary poetry. The great collection of critical material thus far available has been Dr. Guest's "History of English Rhythms," admirable for the digestion of material, but, Professor

*A HISTORY OF ENGLISH PROSODY. From the Twelfth Century to the Present Day. *By George Saintsbury.* Vol. I. From Origins to Spencer. 8vo, pp. xvii, 428. Macmillan & Co. London. $2.50.

Saintsbury declares, almost worthless as to the conclusions drawn on every page. There is an abundance of special studies, as of Shakespeare's metrical art, and not a few books and theses which propound and elaborate theories of verse, but a really valuable and sane discussion of the mechanics of poetry, with full knowledge of its history, has awaited the work of which we have the first volume.

The method of the study is, as it has so seldom been, inductive and not deductive. Professor Saintsbury begins with the earliest dawn of English verse in its unrhymed alliterative form, and shows how it passed into the more regular measure and added the grace of rhyme. But it is meter that he is chiefly concerned with as he analyzes the type of each successive writer, giving especial attention to Chaucer, and learning much from the early balladists, who so much influenced English verse.

It is curious how much of the conclusions to be reached are gathered in a series of short excursuses at the end of this first volume. The author takes little interest in the quarrel between those who talk of quantity and those who will have only accent in verse. Indeed, while he says that every line of English poetry proves quantity, yet it is "the very simple truth that accent is one of the causes (and perhaps the main cause) that *make* quantity in English." With that admitted there is little left to fight about. Quantity becomes scarcely temporal when mainly accentual. It is a great pleasure to see that he will have no bewildering variety of feet in English poetry. There are two main feet to which almost everything else will yield, the iambus and the anapest. A line begins apparently trochaic, but really ends iambic with a final accented syllable, so that one has his choice which to call it, except that the feeling is usually iambic; and so the lines that begin dactylic prove only to have an extra accented first syllable and to be really anapestic. The irregularities of meter, which troubled Dr. Guest, do not offend Professor Saintsbury. He shows that from the earliest times an extra short syllable could be added to iambic measure, much to its ease and beauty, it being considered that the first lines should give the norm, and that the last feet are properly fixt. Thus in the lines:

"Bare is my basnet-top, my love,
Of rose or rose-marye—
Nor bough nor flower at any hour
On my crest might men see.

"But it's O on the day when I saw you first,
For a branch of the rowan-tree!
To have kept me safe from you, my love,
For a black witch as ye be!"

the feet in the first verse are regular iambic, while the second verse dances off into anapests; but still the measure is not anapestic, but iambic, under the principle of substitution. In this, as in other points, we observe that sound judicial spirit which is not led astray by pedantry. But what saves him from pedantry is his fund of humor, of a peculiarly literary quality, which is so closely allied, as all humor is, with common sense.

Picturesque Greece

The seventy-five paintings of John Fulleylove, and the description by the Rev. J. A. McClymont, make one of the finest of the many fine books written about Greece.* Woodsworth's old wood engravings, tho they furnished delight to several generations, showed great liberty in altitudes and spacings. But in recent years painters have come to Greece and found inspiration in the beauty of its landscapes and of its ruins. Mr. Fulleylove has here reproduced this beauty with discriminating judgment and exquisite taste. It is true that still more beautiful views might have been chosen in some instances. Akaruania and Ætolia are the most picturesque part of Greece. Thessaly, Bœotia and Eubœa come close after. There is nothing grander than Thermopylæ. Pylos (Navarino) is superbly picturesque; and yet all this is left out. So also is the wild part of Arcadia north of Mantineia and around the River Styx. Attica is favored. Of the seventy-five views thirty-four are of Athens and forty-two of all Attica. This is natural, considering the importance of Athens in the world's history. But Bœotia, with Thebes, Platæa, Leuktra, Chæroneia,

* GREECE. Painted by *John Fulleylove, R. I.*; described by *Rev. J. A. McClymont, M.A., D.D.* New York: The Macmillan Co. $6.00.

Orchomenos, should not be entirely left out. It seems as if the explanation is in part that the artist has to pay some regard to his own comfort. He is not only likely to go where his public goes, but he may also be forgiven the trials of a Bœotian visit. Among so many choice pictures, the best, perhaps, are pages 20, 74, 86, 92, 96, 114, 124, 128, 132, 140, 174, 178, 198. No. 174 may seem exaggerated, but it is not very much so. The golden glow on the buildings of the Akropolis is no exaggeration whatever. The colors on No. 178, the view on the road from Athens to Eleusis, tho wonderful, cannot be challenged.

The descriptive text is admirably written and follows the principle *μηδὲν ἀγ᾽αν* The writer has traveled with his eyes open, and has read the latest books. He knows Dörpfeld's views as to Leukas being the real Ithaka, and as to the absence of a stage in the Greek theater. He quotes Victor Berard on the location of Pheræ as farther to the north than Kalamata. But he does not follow the latest speaker without deliberation. He has also given very correct descriptions of late excavations, as in the case of Corinth. He describes well the Gospel riots in Athens in 1901, a great event in the capital, but not in the country. His comparison of the lately assassinated Prime Minister, Delyannis, to Aristides and Epaminondas, is premature. Once in a while his Greek fails him or his proof reader is careless. He gives Eurysthenus for Eurystheus, Scopas for Scopos, the knoll on which Epaminondas died; and obscures Meligala, "milk and honey," a good name for a town, with "Meligula." He mistakes the soft rock thru which the Corinth Canal is cut for "sandy or alluvial soil," and puts the older Heraion of Argos on a lower level than the new one, while it is really on the higher plateau. His brief description of the ruins of Tegea can hardly have been written with the completed excavation before his eyes. He is strangely ready to concede the origin of Mycenæan civilization to the Phœnicians. Of Nauplia he says, "Napoli de Romania (Naples of Greece) betokens the beauty of its situation," as if a comparison with Naples were implied. In placing the Homeric Sparta at Therapne, on the east bank of the Eurotas, he may be correct, but that prehistoric Ephyra, the precursor of Corinth, has left any remains we may doubt. There is something like chaos in the spelling of proper names, especially in the use of *c* and *k*. The captions to the illustrations incline to the endings in *os*, but *us* is still used. Jupiter is used for Zeus. Brass and brazen stand for bronze.

La Rebelle. Par Marcelle Tinayre. Paris: Calmann-Lévy. 3 fr. 50 cents.

The woman's movement takes very different forms in different countries. In America it is literary culture and a struggle for the suffrage. In Germany it is now in the dress reform and *Mutterschutz* stage. In Russia it runs to revolution and medical science. In France—well, to understand *la question féministe* one can do no better than to read this romance. It presents all phases of the rebellion of woman against the tyranny of man, not in an abstract and didactic way, but acted out by living characters. Madame Tinayre draws with deftness the varied types of more or less emancipated women that gather in the editorial office of *Le Monde Féminin*. She then introduces to us an author of the opposite sex, an enthusiastic advocate in his books of the fullest liberty for women in all respects, but when he is confronted with a condition and not a theory, he finds difficulty in living up to his principles. When it concerns the woman he loves, he shows the old Adam in him is not dead yet, and he behaves much like an ordinary Frenchman. Madame Tinayre, in spite of her originality, does not succeed in getting away from the conventional French motive for a novel.

Plays: Pleasant and Unpleasant. Volume I. Containing the Three Unpleasant Plays. "The Philanderer," "Widowers' Houses" and "Mrs. Warren's Profession." Volume II. Containing the Four Pleasant Plays, "Arms and the Man," "Candida," "The Man of Destiny" and "You Never Can Tell." By George Bernhard Shaw. New York: Brentano's. $2.50.

Of all plays published Shaw's read the best, for he has made the bare stage directions into witty little descriptive passages, and prefaced them with paradoxical prefaces explaining in the most amus-

ing manner what he does not mean by them. He shows in his title that he understands the public taste which he refuses to cater to. All four of the "pleasant plays" were immensely popular last winter in New York, while the only one of his "unpleasant plays" that was put on the stage was taken off the next night—by orders of the police. But as it has since been decided by the court that "Mrs. Warren's Profession" is not an immoral play the public is at liberty to read it at least — if anybody wants to. But we do not agree with Shaw's inference that the three plays are deemed unpleasant and tabooed because they attack the evils and follies of our social order. The comedies of the second volume are as sharp in the thrusts at conventional shams and wrongs, but they are accompanied with a laugh that alleviates the sting without destroying the effect. At any rate, we hope Brentano will sell the volumes separately. What the plays are our readers know from our theatrical criticism during the past two seasons.

Eve's Diary. By Mark Twain. New York: Harper & Brothers. $1.00.

Mark Twain was apparently the first to recognize the humorous possibilities in our first parents. It was many years ago when he called attention to the fact that with all our statues of great men no one had raised a monument to Adam, altho, as Mark Twain said, the human race owes much to him. He is now endeavoring to remedy this remissness by his translations of the diaries of Adam and Eve "from the original manuscripts." The only fault to find with these books is that there is so little of them. Eve's early scientific reasoning is crude, but not unlike that of many of her descendants:

> "I have learned a number of things, and am educated now, but I wasn't at first. At first it used to vex me because, with all my watching I was never smart enough to be around when the water was running up-hill; but now I do not mind it. I have experimented and experimented until now I know that it never does run up-hill, except in the dark. I know it does in the dark, because the pool never goes dry, which it would, of course, if the water did not go back in the night . . . By experiment I know that wood swims, and dry leaves, and feathers, and plenty of other things; therefore by all that cumulative evidence you know that a rock will swim; but you have to put up with simply knowing it, for there isn't any way to prove it—up to now."

How Ferns Grow. By Margaret Slosson. With 46 plates by the Author. 8vo, pp. 156. New York: Henry Holt & Co. $4.00.

The author of this work is a competent botanist, and one fern variety bears her name as its discoverer. This is not a handbook for the use of the summer visitor to the mountains or seashore, as the title might seem to indicate, but a careful study of the venation and growth of nineteen mostly common ferns, showing the successive stages of their growth from the first little leaf that comes from a spore to the full-grown fruited frond. The plates—sometimes half a dozen stages on one plate—show how much the young ferns of various species sometimes resemble each other, and how the midveins control the development of the lobes in ferns as in other plants. The author suggests that the successive developments in form represent the stages thru which the fern has past in its evolution. These plates, which give the forms and venation in the earlier stages of growth, are of much value, but we are not quite convinced as to her doctrine of the dependence of the laminæ on the venation. We observe the influence of the New York School of Botany in the names, particularly of *Belvisia* for *Asplenium ruta-muraria*. While valuable particularly to technical botanists, the work will be helpful to others; and this the author must have had in mind when she put the English names on the plates, which are remarkable for the exact reproduction of the veinage. We are especially glad to see full figures of the so-called Massachusetts fern, *Dryopteris simulata*, a species lately separated from *D. Thelypteris*, and not easy to distinguish from it. We notice on page 114 two misprints, one in the synonomy, and the reference in the note, which should be to page 110 instead of 94.

The Crime of Sylvestre Bonnard. By Anatole France. New York: Harper & Brothers. $1.25.

The French at their best are so charming that we resent all the more what they are at their worst. In *The Crime of Sylvestre Bonnard* we have the French

at their best. The dear old man who is his own biographer is charming — as a good child is, and the sweet childlikeness of his nature is its most lovable trait, not hidden from the reader, and patent to several detestable persons in the book who trade upon the gentle ignorance of the Wise Man. The story has had many translators, but of them all the translator of the present edition, Lafcadio Hearn, has been most happy in preserving the elusive fragrance of sentiment in this beautiful old rose-jar of a book. M. Bonnard commits a technical crime, in a just cause, and in aid of the helpless and innocent; the story is interesting as a story; but that is not the reason it will live; its appeal is to the nobler side of human nature; we read with delight and sympathy the author who has the skill to make goodness engaging, unselfishness attractive and gentle self-sacrifice lovable and to be desired. Such men deserve and win our gratitude.

Creatures That Once Were Men. By Maxim Gorky. Translated by J. K. M. Shiragi, with introductory by G. K. Chesterton. New York: Funk & Wagnalls Co. 75 cents.

This is a characteristic story of this prophet of the slums. Its very title has a bitterness of which no other author is capable, "the Ex-Man," to give a still more succinct translation. It is a description of a doss-house into which have drifted the refuse of humanity, the failures in the struggle for life, either thru fault of their own or fault of circumstance. Here are found the teacher, the priest, the journalist, the merchant and the officer, now rejected by these professions, but bearing the stamp of their training, boasting, drinking and fighting for companionship and seeing the world of the prosperous topsyturvy, for they look at it from beneath. The author's purpose is really to belie his title, for he shows that each of these degraded beings has traits and impulses like our own, and so he compels us to admit our relationship of a common humanity. A witty and paradoxical essay by Chesterton adds to the value of the little volume, and from it we must quote one paragraph:

"Gorky is pre-eminently Russian, in that he is a revolutionist; not because most Russians are revolutionists (for I imagine that they are not), but because most Russians—indeed, nearly all Russians—are in that attitude of mind which makes revolution possible and which makes religion possible, an attitude of primary and dogmatic assertion. To be a revolutionist it is first necessary to be a revelationist. It is necessary to believe in the sufficiency of some theory of the universe or the State. But in countries that have come under the influence of what is called the evolutionary idea, there has been no dramatic righting of wrongs, and (unless the evolutionary idea loses its hold) there never will be. These countries have no revolution, they have to put up with an inferior and largely fictitious thing which they call progress."

The Mystery of the Lost Dauphin. By Emilia Pardo Bazán. Translated by Annabel Hard Seeger. New York: Funk & Wagnalls Co. $1.50.

Here is another story of the Lost Dauphin. The novelists are the only people who have ever found him. And they find him too variously. In this particular book something is added to the general confusion by the author's assurance that the Empress Josephine twice rescued him from prison, with a view to hanging him like a sword over Napoleon's head in case he carried out his threat of getting a divorce. The story is interestingly told, and is based upon the lives and claims of the various impostors who teased Louis XVIII with pretensions to his throne, but in spite of the author's melodramatic manner, it falls far short in real dignity and tragic power of Charles Marriot's novel, "The Last Hope." But that which arrests attention is this curious fact, that while the incidents of these numerous stories differ so widely, there is a pathetic psychological likeness between all the lost Dauphins portrayed. He is always a poor creature with more heart than head, and showing a sort of inexpedient nobility of nature which made him the victim of his enemies. Señora Emilia Pardo Bazán is called the "creator and protagonist of Spanish Realism," but if she is, Spanish Realism is more incredible than Romanticism is anywhere else. Her literary style is remarkable for clarity and simplicity, but there is not enough horror-producing power in it, even when she writes of horrors to warrant her being classed with Turgénieff and Zola, where some of her admirers insist upon placing her.

The Bird Watcher in the Shetlands; with Some Notes on Seals, and Digressions. By Edmund Selous. New York: E. P. Dutton & Co. $3.50.

This is a Gilbert White sort of book, and fascinating from beginning to end. It is divided, about half and half, between the birds and the seals, and we like best the seals. We are not sure that the observations are always correct, but the romance and the poetry of the fish and bird life is perfect. The author hates gunpowder, and "deplores it above all the other inventions the world has ever made"—not because it kills men, but because it kills beasts; and there is something in a gun and its cartridges "that dries up all the poetry in a man's heart." He deplores railways, also, which take away all charm from the country, and kill the ballads and songs of the people. He thinks it is the absence of all reference to railways that makes the writings of our grandfathers and grandmothers such pleasant reading. The novels of Miss Austen are delightful because they belong to quaint little circles; and how could Sterne ever have made his Sentimental Journeys by rail? He gets out of all patience with these modern aristocrats whose only notion of the country is a place that they can fence in with barbed wire and keep for a game preserve. If these men had anything in them that responded to the real and only charms of the woods, and the lakes, and wild bird life and animal life, they would rejoice more at the flight of a single raven than in bagging a thousand brace of grouse. Thev turn the living wilderness into a dead one, and chase every smile away from the face of nature. They cry "kill, kill, kill, kill," and let the sole of the gamekeeper dominate the world. In all this we thoroly sympathize with the author. The whole book runs after this sort, and you will hardly skip a page to find some expression of tenderness for animal life or sympathy with simplicity. What may be thought of an occasional questionable conclusion, it is certain that the book will afford immense pleasure to the scientist as well as the less carefully trained reader. He thinks that the real naturalist should be a sort of Boswell, and every thing and every creature should be a sort of Dr. Johnson, to be studied with a passionate admiration. He would rather be the founder of "a school of naturalists of this sort" than to establish a triumphant religion or earn an epitaph in Westminster Abbey.

"Some men have strange ambitions. I have one;
To make a naturalist without a gun."

What we want is to find out the inner life of animals—not a few bald facts about their habits. The zoologist should go out with glasses and notebook. He should stalk the gorilla, follow the elephant, get to windward of the antelope; to biographise these animals, and not to shoot them. Well, we have a pretty strong faith that something of this kind is sure to come about. We are particularly interested in his discussion of the playfulness of the seal; but we are confident that his observations are incomplete. We are satisfied that play is a universal first step of animal life, toward reason. Puppies play before they reason, and reason they certainly do. However, it will never do in a book review to come into collision with our friend Burroughs. We need hardly add that this volume of Mr. Selous comes very close to our heart, and will be treasured for reading over again and again as we swing in our hammock under the big spruce trees. It deserves its place alongside with the investigations and vaticinations of Thoreau. In fact, it is one of the best books of its class that we have happened upon these many months.

Captain John Smith. By A. G. Bradley. New York: Macmillan & Co. 75 cents.

If it is a virtue to write an interesting book Mr. Bradley deserves the praise of all lovers of virtue. A subject of far less human interest would be given an adventitious charm by the grace and smoothness of the author's style. But such a master of the art of writing would hardly need to be so uncritical and credulous as Mr. Bradley has been in order to include certain episodes of great human interest but more than doubtful truth. Because John Fiske has accepted Smith's lady love, the charming Charatza Tragabigzanda, is no reason why an author who has had the benefit of more critical research should have accepted the story without a query. The heads of

the three Turks cut off in a single combat just to "please the ladies" might also have been relegated to the limbo of the absurd and unlikely, but when at last Mr. Bradley sneers at the criticism which throws a doubt upon the Pocahontas adventure we begin to doubt his scholarship, if not his honest desire, to state the truth. Aside from all the other facts pointing to the falsity of Smith's story, the author must admit it is peculiar that Smith forgot to tell the Pocahontas episode in the original account of his captivity, but waited until sixteen years later, when the Indian princess was a favorite in the court of King James, and then thrust the story into a revised edition, because apparently it would throw a new luster upon the fame of the redoubtable Captain John Smith. It may be that some of the best critical work of American students destructive of this Pocahontas yarn has never come before the eye of our English author, but the writer of "Sketches from Old Virginia," "The Fight with France for North America," and an admirable life of Wolfe, ought to be familiar with such critical literature in American history. With all the author's credulity, however, we have in this work one of the best accounts of Smith's life that has been written.

Brahms. By J. Lawrence Erb (The Master Musician Series). London: J. M. Dent & Co.; New York: E. P. Dutton & Co. $1.25.

Mr. Erb divides his little book on Brahms into three parts, called respectively "Biographical—1833-1854" (why the latter date none may know, for this section of the book covers the composer's career to its end with his death in 1897), "Brahms: The Man" and "Brahms: The Musician." He says the work was conceived and carried out as a labor of love, and there can be no doubt of his worshipful attitude toward his hero, all of whose thoughts, words and deeds were altogether right in his eyes. Yet the little biography reads like a perfunctory recital of the incidents of an uneventful life, is almost as dull as the dullest of Brahms's music—and that master, despite his towering greatness at times, at other times could write music more deadly dull than any of his contemporaries. There is room for a good, complete biography of Johannes Brahms in English, for none exists. And, notwithstanding the composer's uneventful career, so far as outward conditions could indicate, such a work in competent hands might become the depiction of the growth of a noble soul. But Mr. Erb has not attempted that difficult task. He likens Brahms to Browning, yet it does not occur to him to complete the comparison and carry it to the point of applying to the musician what some one has aptly said of the poet, that tho "the subtlest of writers he was the simplest of men, and he learned in serenity what he taught in song." The author's style is commonplace, and we must again express regret that the editor of this series of most attractively made books on the master musicians cannot find contributors who are better qualified. Mr. Erb's book is not a bad book; he has gathered his materials conscientiously and he has not tortured truth in their presentation—only he has missed the opportunity to create a fine piece of work. However, until a better is produced his book will prove serviceable. The second section is the most interesting, for it contains some good anecdotes of the composer, loosely strung together, one of the best of which illustrates both his "thorny impenetrability" to strangers and his fondness for joking:

> It is related that at Baden-Baden he was approached by a "lion-hunter" as he lay under a tree in a garden. A little speech, evidently prepared beforehand and overloaded with flattery, was interrupted by Brahms, who said, "Stop, my dear sir. There must be some mistake here. I have no doubt you are looking for my brother, the composer. I'm sorry to say he has just gone out for a walk, but if you make haste and run along that path through the wood and up yonder hill, you may probably still catch him."

The Universal Kinship. By J. Howard Moore. Chicago: Chas. H. Kerr & Co.

This book by the Instructor in Zoology in the Crane Manual Training High School of Chicago is an interesting attempt to prove that man is not the "Lord of Creation" that he likes to imagine himself. The first three-quarters of the volume is devoted to showing, from the theory of evolution, man's physical and in-

tellectual kinship to all other living things, and the last part is an argument for vegetarianism and kindness to animals, and human humility. Much of what the author says is true, but in the attempt to prove his thesis he is inclined to ignore the evil side of the brute's nature and the noble side of human nature.

Literary Notes

....*The Financial and Economic Annual of Japan* for 1906, published by the Japanese Government, Tokyo, is far superior to anything of the kind issued by our Government in giving a clear and concise exposition of all the sources of revenue and items of expenditure. There is a large map and many colored diagrams showing at a glance just how the national income is raised, the earnings of railroads and electric lines, savings bank deposits, wages, interest, etc.

....*The Problems of Babyhood*, by Rachel Kent Fitz and George Wells Fitz (Holt, $1.25), is a good book to give to a young mother. It is prettily printed and illustrated and full of sensible advice on building the constitution and training the character of a baby, and differs from most of the books of the class in being free both from scientific terminology and from sentimental mysticism. Some of the measures advocated, such as the baby window-box, are novel, but quite in line with modern ideas of hygiene.

....It is very appropriate to issue a new edition of *Elizabeth and Her German Garden* with illustrations in colors, as has been done by Macmillans, but Elizabeth uses so many color-words that one hardly needs it unless he is afflicted with mental Daltonism. Besides some of the pictures do not look as we had imagined the scenes and persons and that introduces a foreign element into the familiar book, and we cannot appreciate them on that account. But those who are not troubled by such preconceived notions may like them, so this is a good chance to get acquainted with one of the most delightful of outdoor summer books.

....The separation between the American and the English branches of the Society for Psychical Research may perhaps be a matter for regret to some in this country whose sympathies are with the more cautious and non-committal attitude of the parent society, rather than with the votaries of Mrs. Piper. To such *The Occult Review*, which this month begins its fourth volume, and which is now published at 669 Sedgwick street, Chicago, may supply a need. It is not burdened with the technical nomenclature which makes "hard reading" of the *Proceedings S. P. R.* Its editor, Ralph Shirley, is well known in England as an accomplished scholar, and its contributors include many whose names are familiar in literature and science.

Pebbles

THAT new universal language, Esperanto, is getting a firm grip on humanity in all parts of the world. Some readers may not know what it looks like and sounds like. The following translation of the chorus of "Everybody Works But Father" may enlighten them:

"Cui labores sed patro
Li sidas cirkau vio tago
Kun lia piedoj sur des fijaro-loco.
Fumiant lia argila pipo,
Patrimo emprenas des lavo,
Tiel faras filino Anne.
Cio laboras en mia domo
Sed mia maljuma viro."

—*Chicago News.*

ANSWER TO A WEDDING INVITATION.

MR. BLACK regrets that he
Must impart the information
That he can't accept with glee
Mrs. White's kind invitation.
Candidly he must avow,
Risking being thought unpleasant,
That his means do not allow
Of the purchase of a present.

Mr. Black, too, would remind
Mrs. White, without evasion,
That they've met, through Fate unkind,
Only upon one occasion.
As for the prospective bride,
Her no doubt delightful daughter,
If her form he'd ever eyed
Something he perhaps had bought her.

Mr. Black must, therefore, state,
Taking all things in conjunction,
That he can't participate
In this fashionable function.
He is neither millionaire
Nor a dog inclined to mangers;
He's just one who cannot spare
Charities for perfect strangers.

—*London Tribune.*

CORRECTING THE STATEMENT.

A LOCAL paper received information that a certain doctor was engaged to be married to the bank manager's daughter, an elderly maiden who had long been vainly striving, by all the spells an artful woman can weave, to ensnare his heart.

Without troubling to verify the news, the editor published it, and the polite doctor, after giving his anger a little time to cool, wrote to contradict it.

"Gentlemen," he wrote, "I regret to say that you have blundered sadly with regard to me and Miss Fortie Fore. We are not engaged to be married, nor are we ever likely to be."

Yet this good-tempered reproof, which ought surely to have called forth an unqualified apology, was turned against the unfortunate doctor in a shameless manner in the next issue of the paper.

"We have received a courteous letter from our worthy townsman, Dr. Brown," it announced, "in which he states that the item of news we printed last week is untrue. He is not, he regrets to say, engaged to be married to the bank manager's daughter."—Sydney *Mail.*

Editorials

Great Beneficences

We have asked a number of wise men and women to answer the question how they would wish Mr. Sage's millions to be expended in philanthropy, not with any idea that Mrs. Sage would find in the answers what would help her decision, but because it is not a bad plan to consider once in a while what are the costly things that need to be done for the benefit of man. In these days, when certain men cannot well help becoming very rich, and when a certain number of them really want to do good with their money, and yet are too busy or too unskilled to know how best to distribute their beneficence, it is well to have the matter considered, so that the more important and useful objects may be in the public mind. It is, then, with no meddlesome impertinence that we have made Mrs. Sage's task and privilege the occasion for this discussion.

The large givers have usually made their gifts wisely. The last of them, Mr. Beit, has given a million dollars to each of two universities in South Africa, and five millions to extend the African railways. Mr. Carnegie's gifts in his lifetime, as also Mr. Rockefeller's, have been very large and very wise. Those of Cecil Rhodes had a wide outlook, and serve to bring the English-speaking world closer together. Indeed, the wants are so great and are so close at hand, and the common needs of education and hospitals and libraries are so obvious that one can hardly go astray.

Of those who have written in this number of The Independent, President Jordan only has attempted to lay down a principle philosophically. He says that gifts to be spent on individuals are of much less value than gifts whose use in training or developing character will make them felt long after the immediate recipients have passed away. For that reason several of the writers, who are teachers, advise gifts for research. Indeed, that seems now to be the most popular suggestion. We doubt if there are not other causes that are suffering quite as much for lack of funds. Money can thus be spent most profitably, but a multitude of men are now eager in that pursuit, and it will not be neglected. At present there is no such crying need for support to students of research as there is for the extension of the lower education in portions of our country and in other countries; for we would not have the money given only for this country.

Following the line of President Stanford's suggestion it occurred to us that we would draw up an analytical scheme of the objects for which gifts or bequests have been or profitably may be given. It is as follows:

Philanthropic Expenditure.

A.—Objects—

1. Educational—Schools, all grades and subjects; Libraries, Museums, Lecture Courses, Newspapers, Books, etc.
2. Research, Discovery of New Truths—Science, Medical, History, Invention, etc.
3. Religious—Churches, and their various departments; Missions, Evangelists, Bibles, Tracts, Periodicals and other literature; Masses, Monastic Institutions, etc.
4. Moral—Prizes for Heroism and Virtue, Anti-Vice Crusades, etc.
5. Esthetic—Art Galleries and Exhibitions, Concerts, Endowed Theater, Statuary in Public Places, Fountains, Parks, Purchase of Art Works, Prizes for Art Works, Flower Mission, etc.
6. Promotion of Industry—Good Roads, Railroads, Trade Schools and Technological Exhibitions, etc.
7. Relief—Hospitals and Dispensaries, Houses of Refuge, Homes and Asylums, Labor Colonies, Free Lodgings, Model Tenements, Dowries, Food, Clothing, Rent, Fuel, Ice, Pensions, Fresh Air Funds, Free Legal Services, Protection of Women and Children, etc.
8. Influencing Public Opinion, Endowment of Causes—Peace, Temperance, Spelling Reform, Vegetarianism, Zoophily, Zionism, Various Isms.
9. Eugenics, the Improvement of the Human Race.

B. Methods—Common to almost all the objects:

1. Buildings for societies, libraries, galleries, museums, offices, etc.
2. Salaries of secretaries and organizers.
3. Publication of papers, periodicals and books.
4. Training of the young.
5. Endowment of gifted individuals.
6. Expenses of conventions.
7. Expenses of achievement, personal support, apparatus, material, assistance.
8. Purchase of product, pictures, statuary.
9. Prizes for achievement, essays, works of art, discoveries.
10. Lectureships.

From such a scheme as this one can select for himself a multitude of direc-

tions in which the largest or the smallest benefactions can be properly bestowed, for we have no patience with the assertion that all gifts are worse than useless except to overthrow the present system of personal ownership of wealth as advocated by Mr. Ghent. We would have the reader study this analysis and consider in what way his fraction of benefaction can be best employed; that fraction, we mean, that looks beyond household and family to the wider reach of humanity.

For while one is worse than an infidel who does not care first for his own, larger wealth makes the obligations for a larger outlook, and that same large outlook is the privilege of even small possession. And it is this large outlook that is most likely to be forgotten. We have been struck by the fact that of those who have written these articles most seem to have thought simply of their own country. Humanity overflows our boundaries, and it is the praise of both Christianity and Socialism that they deal with humanity as well as patriotism. It is the danger of the political doctrine of protection that it is protection against others as well as for ourselves. Dr. Cooper's suggestion takes this larger view, but that was to be expected of one who occupies his position of service.

One recalls the times when for the lack of money great opportunities have been lost. Some thirty years ago the most interesting experiment in modern times of a nation rising out of utter barbarism into civilization and freedom perished for the lack of a few million dollars. While the world was looking on to see the people of the immense island of Madagascar coming rapidly into the family of enlightened nations, on a pretense which money would meet France seized the island and quenched one of the great hopes of the world. It looks as if money were now making a similar experiment in transferring the possession of Palestine to the descendants of those who once were its inhabitants. Mr. Carnegie's proposal several years ago to purchase the independence of the Philippines was of similar intent. We wonder what wealth like that left by Mr. Sage might do to secure the independence and union of Macedonia and the Balkan States, or even to cure the Turkish sore. Or why should not some man of wealth adopt the Philippines, and give them the roads, railways and schools that they need? No broader plan, tho on a small scale, has been conceived than that which gave unfortunate occasion to the discussion of tainted money, for it gave support to colleges where far more needed than here, in China, Ceylon and elsewhere. And this reminds us that the two present great world problems are concerned with the future of China and Russia. Not now, perhaps, but very soon, the hopes of Russia may be greatly encouraged by very large gifts of money. But now, in the awakening of China, there is the chance for many millions being most profitably expended for schools of modern learning in every province.

And that brings us nearer home. There are sections of this country whose school system is sadly inadequate. The lack covers towns, counties and whole States. What man or woman of wealth will adopt such a State, and see to it that, for a while, it is supplied with public schools after the best model, with high schools in the towns, and with colleges or universities, which taxation at present cannot supply? It is worth thinking of.

These are illustrations of the wider outlook. We have not spoken of the work of Christian missions, for that is in every eye, and represents the broadest altruism. We have thought rather of those objects which are usually the concern of States, depending on public funds, but which long delay such objects as popular liberty, public education, or the building of an Isthmian canal. The time is even now here when individuals have the wealth of a whole nation, and can assume national obligations. What might they not do in our cities to make the tenement districts decently habitable? That thought occurred to Mr. Peabody.

Mr. Bryan's Hoodoo.

THE most important factor in Mr. Bryan's Presidential candidature has not been much discussed. It is conceivable, tho not probable, that the capitalistic influence in its antagonism to Mr. Roose-

velt may paradoxically turn to Mr. Bryan as a savior of society. It is possible, tho most improbable, that one of those sub-conscious ground-swells of the political mind, which now and then reverse political majorities, may carry the Democrats into power in 1908, whether the capitalists vote that way or not. But even if all the objective factors should be favorable, it is hardly possible that Mr. Bryan himself will now, or ever, escape from the baleful fatalism of his own individual hoodoo. He is one of those men who can almost infallibly be counted on to pick up the wrong issue at a critical moment.

It was just when men of clearer vision saw that bimetalism was as "lost" a cause as slavery had been, and that it would overwhelm the Democracy in fresh defeat, that Mr. Bryan insisted on fighting out the question of 16 to 1. Today he is quite willing to drop his free-silver program, but his conversion has come too late. That does not prevent him, however, from following his hoodoo on a new track. The railroad problem now occupies his mind, and he has decided, if the newspapers know anything about it, that Mr. Roosevelt's rate regulation and the more radical proposition to turn the railroads over to the Federal Government are equally unsatisfactory. He has devised a scheme of his own which he proposes to offer as the novel plank of his platform.

In a crude way he offered it some months ago, for public consideration, describing it then as a plan for State ownership, in distinction from national ownership. Travel on the continent of Europe has convinced him that there is nothing impracticable in the plan. A continuous railroad service is maintained in every direction thruout Europe, altho the lines cross national boundaries. The passenger who takes his compartment at Berlin is not worried at all by the fact that before he gets to Rome his train will have been under the jurisdiction and management of the Prussian, the Swiss and the Italian Governments. All that is necessary, therefore, as Mr. Bryan sees it, is that continuity of trunk line travel shall be secured, and he therefore proposes that the Federal Government shall own a few important trunk lines, leaving all local railroad business to the several States.

This plan is so peculiar that, we may be very sure, Mr. Bryan has not proposed it just for the novelty of it; and we should like to believe that the ostensible reason which he advances is the real one. The creed of political decentralization is all very well, and now that the supremacy of the Federal Constitution is assured, it is quite proper that States should jealously guard their local authority. But there is, unhappily, more than a suspicion abroad that Mr. Bryan's desire for State-controlled railways reveals his interest in an aspect of State authority which can hardly be described as a constitutional issue.

The public may as well force Mr. Bryan to declare himself on this point immediately. No future time will be any more favorable, and the sooner all doubt is removed the better. The facts are bound to come out, and if they are what the politicians suspect and hint at they will finish Mr. Bryan as a Presidential candidate quite as remorselessly as 16 to 1 finished him in his previous campaigns.

Does Mr. Bryan advocate this queer plan of a State railroad system because a Federal railroad system would not provide a Jim Crow car service south of Mason and Dixon's line, and does Mr. Bryan imagine that by making this concession to Southern sentiment he can hold together the solid South while fighting along advanced radical lines for political success in the North? We do not raise this question for the sake of exploiting our own individual guess. It has been raised in other quarters, and we merely repeat it. We venture to say that Mr. Bryan cannot ignore it, and we venture to say further that unless he can answer it with the skill of an Oriental calif in dodging logical contradictories, one or the other of which must to the ordinary intelligence be true, he will wish that he had let the railroad problem alone. Whether the American people will presently turn their railroads over to national management we are not wise enough to predict, but even an American weather forecaster, with all his bad habits to guide him wrong, could confidently predict that we shall never turn our

great railroad systems over to forty-eight or nine State governments. And even if there were the possibility of dividing control between Federal and State governments, as Mr. Bryan now proposes, the mere suspicion that the Jim Crow car interest was to be conciliated would make the solid South as lonesome on the morning after election as it has been on various noteworthy occasions heretofore.

If Mr. Bryan really would like to be President of the United States, his best chance is to follow a bit of advice for which we shall present no bill. Let him drop all Southern questions, all Pacific Island questions, all railroad questions and all money questions, and ask the people of the United States what they propose to do about their beautiful and sacred tariff. We don't believe that he would be elected even then. But he might make an enviable reputation for himself as an "educator."

Three-Cent Fares

THE East has hardly waked up to the idea of three-cent street railroad fares; but it is a live question all thru the Middle West. And it is not merely a demand for cheaper fares, but a part of the movement to bring the street railroads into the possession of the municipalities. These cities have grasped the idea that it is better to make bargains in advance for extensions and renewals of franchises than to wait till the last franchise has expired.

The attempt to realize this idea has called into existence in each city new street railroad companies, which are in a more or less complete state of organization and all of which have two characteristics in common: They all propose to carry people for three-cent fares or under, giving transfers; and all propose to sell out to the municipality at times and upon terms and prices arranged for in their charters, the price to be on a basis of the actual cost of their plants.

In Detroit the old street railroad company has now offered to sell ten tickets for a quarter during the three busy hours of the morning and the two of the evening, and six for a quarter during the other hours of the day, a single fare to be five cents. At present the old company sells eight tickets for a quarter. The new proposition also includes an offer to sell out to the municipality on prearranged terms. Ten tickets for a quarter (workingmen's tickets, they are styled) looks good to the Mayor, and he is enthusiastically supporting acceptance of the proposition. Some of the City Council and a number of citizens are in favor of immediate municipal ownership and operation, or at least of acquiring the railroad eventually on more favorable terms than the old company at present offers. There are other citizens again who demand lower fares than the rate offered of six for a quarter during the nineteen hours of the day and the five-cent single fare. The joint opposition of these two classes of people has delayed acceptance of the proposition of the old company until now a new company, the People's Railway Company, composed of local and foreign capitalists, has appeared upon the scene. It proposes to sell ten tickets for a quarter during the five busy hours of the day, morning and evening, and eight for a quarter during the other nineteen hours of the day, and to sell the railroad itself to the municipality on more favorable terms than the old company has yet offered to take for its plant.

Columbus had its fight several years ago, but the contest was of about the same character as in other places, and the city is soon to reap the full benefit of its bargain. The old company in Columbus made propositions in advance for extensions and renewals of franchises, whereupon a new company made its appearance and submitted very much more favorable terms as to fares and eventual municipal purchase. The contest was ended by the city accepting the proposition of the old company, which was to sell seven tickets for a quarter until such time as the gross receipts of the road amounted to $1,750,000 per year. Thereafter the company was to sell eight tickets for a quarter. The gross receipts of the company have about reached the mark set.

Bloomington has its war. The old company is confronting an offer made by a new company, offering three-cent fares and to give the city seven per cent. of the

gross earnings, besides favorable provisions as to eventual municipal ownership.

Cleveland seems to be the storm center of the low-fare war. It certainly is the spot on which the street railroad magnates of other cities have their eyes. The attempt to reduce fares from five to three cents is led by the Mayor, Tom L. Johnson, whose vigor and ability, backed by his experience as a successful street railroad owner and operator in Brooklyn, St. Louis, Detroit, Indianapolis and other cities, as well as formerly in Cleveland, strengthens the three-cent fare people. The opposition on the part of the old company is made formidable from the character and personnel of its owners, who are Cleveland's leading citizens and are persons of the largest financial and political as well as social influence.

The old company, for some several years, has been attempting to get its franchises renewed and extended in advance of their expiration, and has been making propositions to the city from time to time looking to that end. Several new companies have meantime entered their appearance and submitted propositions. Some of the new companies have acquired rights in the streets, but in very limited sections—enough, however, to get the camel's nose in, so the old company evidently thinks, judging from the litigation and fusilade of injunctions in all the courts, State and Federal, on any and all occasions, with which the old company has greeted any move on the part of the new companies. No such litigation, in persistence and volume, has been attempted on the part of an old company in any other city. The old company now offers to sell seven tickets for a quarter and give transfers, and to give the municipality the right to purchase on prearranged terms. The old company points to the many long hauls which it makes for a single fare — one haul being nineteen miles — and to the numerous transfers which it gives, and lays great store by the complete facilities which it furnishes citizens to go to all parts of the city from any one point. The new company has succeeded in laying some few miles of track on several streets. It offers a single fare for three cents and to sell out to the city at any time on the basis of actual cost, claiming that while the capitalization of the old company is $150,000 per mile, two-thirds of which is water, the capitalization of the new company will be $50,000 per mile, which amount will fully duplicate everything that the old company has. The new company also offers to give the city all profits above six per cent. on its capitalization which it may make, its books to be open to the public at all times. This is almost municipal ownership, without municipal management.

The old company has retained the services of an expert editorial writer, lately writer for the railroads during the rate legislation agitation before Congress at Washington. He daily publishes in all but one of the newspapers editorials, set in large type, putting forth the old company's side of the story and the advantages offered by it and belittling what the new company can do, even if granted the franchises which it asks. The old company calls its newspaper advertisements "a campaign of publicity." Mayor Johnson publicly styles them as "a campaign of duplicity." The new company has lately put $750,000 par value of its stock upon the market at 90. This has been largely oversubscribed, in small amounts, by Cleveland people.

Meanwhile the cities of the East are quiet, perhaps asleep.

Morning in August.

Did you ever notice how the world wakes up in August? It had been a sweet calm night—almost drunk with sweet odors. It was one of those nights when wakefulness is restful. The full moon made a mild daylight, and it was not necessary to go to sleep in order to dream. The dew held a thousand perfumes, that it had caught from mints and geraniums and wild blackberries and ripening beech-leaves. By day these are localized, but at night they blend and flow all over the land, and even sink into the earth. Night has this democracy of Nature, and a fraternity of trees and plants. The sharp outlines of the oaks are softened into those of the ash, while in the orchard the great red apples, half hid in the leaves, swing low to your

cheek. Peaches and plums lose their scarlet and purple by moonlight, but their roundness is not quite confused in the foliage. An August night is the most perfect that the year can produce.

It is not until late in July that the hurry and bustle of growth exhausts itself. In May and June it flows over into the night, from the day, and one is conscious, if abroad, that every limb is lengthening, every leaf is broadening and all the fruits are coloring for the harvest. But in August there is a smell that comes from ripening grain, and from mellow pears, while there is a perceptible let-down of the activities of Nature. The sun does not rise so early by half an hour, and the temptation is strong to follow his example. The robins sing only half an hour at daybreak, while the catbird satisfies himself with a quiet monotone under your window, and the song sparrow tosses off only an occasional trill. Most of the song-birds have finished home-keeping for the season, and are perceptibly less musical and less excitable. The drone of the cicada is curiously lulling by day, as that of the cricket is by night.

It should not be later than five, if you would get the cream of an August morning. It must certainly be a half hour before the sun. Do not wake the other sleepers, but go out alone—bare-headed, and as full of individual freedom as Adam himself. The country editor has no fancy for barefootedness, however, because one is then all the time thinking of his feet, and looking out for all sorts of stubs and thorns. But go out, carefully shod, and with alert senses, into the garden, now, before the appetite is waked up, and while the ears and the eyes can wait on the soul. What fine ways the garden has! You look on your melons and your green corn, not as stuff to be eaten, but as an expression of the esthetic in Nature. The breeze belongs —that is, this kind of breeze—only to a morning in August—half awake, half asleep—stumbling against the leaves, and wandering around without a definite aim. It picks up odors from the scarlet tomatoes, and from the ripening melons, and the nasturtiums and lilies, and grows the more drowsy as it bears them about. Overhead a very small cloud, that has broken its leash somewhere, just touched with the first rays of the sun, laughingly sprinkles us and the garden, and then dissolves into thin mist, as it goes on over the valley. It has only doubled the dew on the grass and swung twice as many diamond drops on the leaves.

In vestal hollyhock still drowsy drones the bee;
And fades into the sky the morning star and moon.
At last from village belfry clangs the iron tongue
That cries, 'tis five. Golden waves roll thru the mist,
And 'round the vale; and sandal all the gladdened hills.

There is a poem in every old Saxon word, and one of these is daybreak. The day is breaking wide open. The sun is well up, and beginning to take control of affairs. We are always glad to see the sun come back in the morning. What would we do with a day ten times as long? We are sun-lovers. It is our natural lord. The dawn is not pale, as the poets are fond of calling it; its colors in August are intense and individualized. Each tree asserts itself. The apples are distinct on the trees; each rose is a special rose. All about the great valley the yellow harvest fields define their outlines, and the green knolls stand up with pride, with orchards nestling between.

The cows beside the creek rise up and stretch themselves,
And look thru twisted rails, at meadows fair and sweet;
Then homeward turn with soft remembrance of the pails.

The sun lays a broadside of light all over the wild grapevines and over the trumpet-creepers that hang down the rows of elm, and the butternuts show great harvests of nuts that they are ripening for the children. The ash trees have already got just a touch of autumn purple, and in the distance you see goldenrod bounding the creek before it reaches the mill. The farmer at his door looks weather-wise and shrewd as he counts up the signs and prophesies no coming storm. But it is still the presence of the trees that you most feel. It is with them that Nature is busying herself these August morns.

Who does not love a tree—a single, perfect tree? A beech, broad-bottomed, sweet-leaved and black-shadowed; or a

great Norway spruce sitting on the lawn, forever speechless, or, like the Buddha, in all seasons and at all hours muttering "Om!" These we love. Evergreens are the monks of the lawn; one should never clip their drapery. You cannot make them over into workaday trees, that stand up and swing their arms, and sigh at night or laugh in the morning. It is only when you have recognized the individuality of trees that you will know what to with them, and will stop misplacing them. Lifting themselves slowly aloft and working out each one his own desire, you find at last that the catalpa and the magnolia, the coffee tree and the maple, have touched hands and made for you a vast bower. Your visitors tell you that you have let your trees shut off the outlook. Coming but seldom, they would see the valley and the distant hills at every turn. They cannot know your friendships with your trees. They cannot feel how your life-thought has gone into their growth, nor do they know that you are largely made up of their shade and life-history. But you, with gladness, walk around these veils of the valley, to find your distant outlooks from other points. Growing with us, and we with them, the trees become our friends and brothers. They sing songs to us; they whisper good will; the birds nest in them; we are all one.

Yet on these dreamy August days there is much to be said in favor of a distant landscape. What ever can so spellbind us as one of these soft mornings, when the valley is full of a soft haze, not dense but dreamy, where the orchards and the yellow harvest stubble, and the corn-fields still green, with meadowed knolls, appear; and down at the foot of all there is the Oriskany, winding everywhere among the groves and gardens, but ever feeling its way millward—and all asleep, or but half awake. Along the high horizon, Crow Hill and Paris Hill and Beacon Hill lift high their curves, and, cosiest of all, are the red farmhouses, and the pastures where the cattle clip the crimson clover. But already we are sliding well down into the work-hours. The editor leaves his garden, now rapidly growing fervid, and loves his veranda, with his hammock and his books. Noon has no compensation for a lost morning. Nature paints no such pictures at any other hour. He who knows not the morning intimately does not know the country as home. He might as well abide in the city!

Those Patent Office Models.

THE appropriations of the last session of Congress amounted to nearly nine hundred millions; considerably more than the whole value of our corn crop. This is certainly very liberal on the part of our legislators. It would seem that such liberality might have found some way to have prevented the scattering of the models in our Patent Office. Here is the visible history of the American people. Yes, it is more than that; it illustrates the making of the people—evolution from a feeble colonial condition into and up to the strength and vigor of the world's greatest industrial nation. Jefferson held the Patent Office to be the most sacred trust held at the capital. For over a century the life of a people has been expressing itself in labor-saving machinery. Here in these models we see how the Yankee conquered a continent; and how he did it by the co-operation of brains and hands. These models show the cause of our present industrial age; our industrial schools, even our industrial creeds—for nowadays the Puritan is one who believes in salvation by doing. One hundred and fifty-seven thousand models fill two hundred and ninety-one exhibition cases, and cover three floors of the great building. Here is the first steam engine that ran the first cotton-gin. Here is worked out, in successive models, all the history of the cotton industry. Here also we have the visible history of the application of steam, both on river and land. The loom also and the sewing-machine are permitted to tell their story from beginning to end. The world holds nothing like it. To dismember this collection —growth, rather—would be like burning every published record in the national library.

Yet this is just what is proposed; just what is ordered. At the last session of Congress it was agreed that only a small part of this sacred trust should remain

intact; and a committee was appointed to determine the fate of the separate articles. No committee could possibly be constituted wise enough to comprehend the values here associated. Edison alone has seven hundred and eighty-four patents; and Silas Farmer, whose models include the first magnetic engine that ever drew a train, has a long list of patents covering half a century. These are the men future history will concern itself with. Nor can agriculture afford to lose a single link of the story that led to its depression from 1830 to 1890 and its expansion since that day. The united voice of the people should call a halt. Congress should be required to reverse the order that has gone forth. The nation will more gladly house this collection than it will pay for any other single enterprise for which its money is freely voted.

The Russian and the French Revolution.

"History repeats itself." Like all the good old maxims, this is reversible, and we can say with equal truth and falsity, "History never repeats itself." Neither statement has any value except as a rhetorical phrase to call attention to some marked similarity or dissimilarity in events. Ever since Plutarch showed us how easy and interesting it is, we have been using the fallacious method of historic parallels. It is very convenient to the student of history, but altogether misleading to the men who are actively engaged in making history. Like causes do not produce like effects in practical politics, because what we call "like causes" are generally casual resemblances between certain conspicuous but often insignificant factors.

None of us can altogether escape the temptation to use historic parallelism as a substitute for hard thinking and real investigation in the case of the revolution—or what we hope will prove to be the revolution—in Russia. But it is already clear that the analogy with the French revolution has been confusing rather than enlightening to us spectators, as apparently it has been also to the Russian actors in the drama. There was the Duma; was it not just like the States-General? And did it not meet in May, too (startling coincidence)? There were the Constitutional Democrats for the Girondists and the Group of Toil for the Mountain. When they found the doors closed against them by orders of the sovereign, they knew exactly what to do. As tho it were a play that they had rehearsed they made a tennis court out of the dining-room in the hotel at Viborg, and reassembling there, took the oath to stand by each other and the people, just as the Third Estate did 117 years before. And what next? A glance at the prompt-book showed them that the taking of the Bastille was next in order. On to Kronstadt, then!

But just here something went wrong. The Government had apparently turned over too many leaves and got the wrong cue. They had skipped six years; it was the 13th of Vendemaire instead of the 14th of July, and they dispersed the mob with Napoleon's whiff of grapeshot. The difficulty was that Nicholas II. had also read history and had a manifest unwillingness to play the *rôle* of Louis XVI. Here, then, our analogy breaks down, just when we need it most.

But before we take leave of it, there is one lesson which we may legitimately draw from it; that is, the lesson of patience. In spite of all our memorizing of dates, we really have the impression that the French Revolution was over in about six weeks, and that it moved smoothly, like some majestic river, to its "inevitable" end. How haphazard, baffling and uncertain it really appeared to those who were in it we can realize only by much reading of memoirs and letters. Our philosophical historians mislead us in this. It was four years before the French got rid of their king and fifty-nine years before a genuine republic was established. If, then, the Russians have done away with the Czar by 1910, and have a good popular government by 1965, we may congratulate them on doing as well as did their prototypes and allies, the French.

If we drop such superficial comparisons and take a broader view of history, we can derive encouragement in this crisis from the observation that a French Revolution is not the only or the best way to attain liberty. All other European

peoples, except the Turks and the Russians, have now substantially the same political rights as the French, and none of them has passed thru a crisis resembling the Reign of Terror and Napoleon's Epoch.

We can palliate these periods of blood and tyranny because we can see the good that resulted from them. The depressing thing about the present Russian situation is the apparent fruitlessness of the period of blood and tyranny thru which they have passed. For all their self-sacrifice and heroism the Russian people now seem further from liberty than they were six months ago. We are promised agrarian riots in the fall, but will these not be as fruitless as the French jacqueries of the fourteenth century? The revolutionists have proved that they can burn down haystacks and manors, seize battleships and fortresses, assassinate officials, print and distribute prohibited literature, paralyze industry, commerce and communication by strikes, barricade the streets and make and throw bombs, but to what good? And suppose they do all these things again in a few months, what reason is there for thinking that they will be any more successful? We used to hear that Russia was one vast powder magazine, and only wanted a spark to set it off. Well, there have been sparks enough of late.

Apparently, the bureaucracy has, from its short-sighted point of view, managed things very skillfully and obtained a tactical advantage. The Duma was allowed to meet and talk long enough to show the futility of meeting and talking, and then quietly dismissed, according to the forms of law. The radical members alienated the more conservative reformers in the Duma by their extreme measures and violent language, and now they have gone home they are being horsewhipped by their peasant constituents for not getting them land. The call for a general strike was not obeyed, and the revolutionary leaders are discredited. The mutinous sailors and soldiers were fired upon by their comrades. The bureaucracy has adopted the tactics of the enemy and is fighting fire with fire. The "Black Hundreds" meet the "Red Guards" in the streets, and assassination is followed by counter-assassination. We do not despair of Russia, but the path to an overthrow of the Government by a revolution of force seems blocked for the present. The political progress of such a race as the Russian cannot be long prevented by an anachronistic autocracy, but it is not safe to prophesy what direction its evolution will take.

Judge Olmsted's Decision.

It is to the credit of the Commissioner of Labor of the State of New York that his energetic enforcement of the law restricting the working hours of women in factories has led to a case before the courts for the purpose of testing its constitutionality. No predecessor of Mr. Sherman has ever exacted obedience to the law with vigor enough to make it worth while for an employer to raise this question.

For twenty years, since 1886, the law has prohibited employers from requiring women to work in factories after 9 p. m. or longer than ten hours in one day thruout the State of New York. If Judge Olmsted's decision is correct all those employers who have obeyed the law as it stood have been put to needless inconvenience, and the women prevented from working in their factories have been deprived of their rights. Such is the result of twenty years of faithlessness on the part of officials entrusted with duties of grave importance to the industries of the leading manufacturing State in the Union. If, on the other hand, the Court of Appeals or the Supreme Court at Washington shall, in due course, reverse this decision, it will follow that, for twenty years, all those women who have been required, on pain of dismissal, to work in violation of the statute more than ten hours, or after 9 p. m., have been illegally deprived (by the failure of the factory inspectors to enforce the law) of that leisure which the statute was intended to confer upon them.

Attorney-General Julius Mayer's announcement that he will carry the case, if necessary, to the Supreme Court at Washington, is as admirable as Mr. Sherman's action, and is in the same line. It is of the highest importance for all the interests concerned that the Supreme Court of the United States should be given the earliest possible opportunity to

resolve the existing disastrous conflict of decisions of State Supreme Courts. In Massachusetts, Nebraska, Oregon and Washington the Supreme Court of the State has held that the hours of labor of women may be restricted by act of the Legislature. In Illinois, on the contrary, the Supreme Court holds that such legislation is in conflict with the Fourteenth Amendment to the Constitution of the United States and therefore void. Judge Olmsted's decision follows the Illinois precedent, and until it is reversed women employed in factories in New York may, like their equally unfortunate sisters in Illinois, be required, on pain of losing their means of livelihood, to work all night, or an unlimited number of hours in the twenty-four.

England, France, Germany, Switzerland and the Australian colonies find it possible to regulate the working hours of women and to prohibit their working at night. The law which Judge Olmsted (Judge Deuel concurring) pronounces unconstitutional in New York has been in force for sixty-four years, since 1842, in England.

In the long run no civilization can survive which fails to protect the health and morals of its working class. If it is true that the Fourteenth Amendment to the Constitution, or any other part of the Constitution, deprives the States of the power to restrict the working hours of women, such provision will have to be changed. In reality, it is not merely this employer, or this statute, that is on trial, but the judges and the Constitution.

The whole nation will owe a debt of gratitude to Commissioner Sherman and Attorney-General Mayer whenever by their determined action they obtain a final settlement of the question whether or not the United States already stands among the enlightened nations or whether it is again necessary, as it was for the establishment of the civil rights of the negroes to change the Constitution.

Influence of the New Sanitary Laws

The beneficial effect of the enactment of such measures as the Meat Inspection and Pure Food laws is by no means confined to a direct application or enforcement of the statutes themselves. Owing to the Neill-Reynolds investigation and the legislation that followed it, official inquiry as to the cleanliness and honesty of slaughter-houses and packing-houses has been stimulated all over the world. It is admitted, for example, that a great many such places in England were in sore need of sanitary improvement. In other countries, also, the attention of public officers has been forcibly directed to unwholesome and unlawful practices that had been overlooked, and in all of them changes for the better are now taking place. In many of our own cities there are slaughter-houses that have been disgracefully unclean and a menace to the public health. Under the stimulating influence of the national inquiry and the national legislation, local sanitary authorities have been inspecting these places and compelling reform. In Philadelphia scores of such foul slaughter-houses have been found and either closed or made clean. In the same city (and elsewhere) there is new activity in detecting the use of harmful material in food and confectionery. Several prominent manufacturers of candy and more than thirty retail dealers in Philadelphia have been arrested and are to be prosecuted for selling candy containing glucose which carries sulphites in dangerous quantities. This is the work of the State's Dairy and Food Commission. While our new national laws are of great practical value, many consumers can be defended against unwholesome meats and the harmful adulteration of food only by local legislation and the action of local sanitary officers. This is realized in many places, and the perception of it is due to the general awakening caused by what has been said and done at Washington.

A City Purified

Kansas City, Kansas, with a population of ninety thousand, claims to be the fifth manufacturing city in the United States. Its meat-packing business is the largest in the world, and next to Minneapolis it is the largest flour-milling city; and it expects to have 200,000 inhabitants in ten years. But the most remarkable distinction which it claims is that it has not a saloon, nor a gambling den, nor a brothel within its limits. It

had them a year ago, all forbidden by law, but allowed by the police, if they would consent periodically to pay definite fines. But the people got tired of lawlessness, and determined to have the laws executed and risk the loss of the revenues from the joints, which were $48,198 last year. So Prosecuting Attorney C. W. Trickett and Judge J. G. Holt took the matter in hand of executing the laws honestly and energetically, and they found it no impossible task. The saloon men declared that it would be the ruin of the city, that it would become bankrupt, that prosperity and business would go, but their forecasts are not justified. Instead of that the city is putting up more buildings than ever; new people are coming in, and the moderate bonded debt of the city will be reduced this year, while the prices of property in the residence districts have advanced since the closing of the joints. The *Star,* the leading Kansas City daily, declares that the city "is awaking to an era of unusual prosperity and development." That is what we might expect. Drinking saloons, gambling dens and brothels carry prosperity nowhere and never. Here is an example to other cities which make bargains with vice.

The Growth of the Ethical Sense

Perhaps the Philippine Commission were too hasty in proposing instantly to suppress racetrack betting, something that has not been achieved in this country. We are not surprised to be told that five thousand Filipinos, with ten bands of music, and three hundred racehorses, paraded the streets of Manila and gathered at the Governor's palace to protest against the threatened enactment. Certain ethical improvements cannot well be embodied in law until the people are educated to them. Our Lord tells us that God himself winks at times of ignorance, and we have to do as much. There is no excuse for race-gambling in this country, for the needed moral education has been given; and commonly recognized evils, such as gambling dens and betting at horse-races, ought to be sternly suppressed. But it is a serious question for the Commission to consider whether, as public sentiment exists in the Philippines, it would be wise or right quite yet to suppress gambling and cock-fighting or polygamy in those islands. If we mistake not, the earliest address of a Pope of Rome, since Peter, that has come down to us, was a pronouncement against gambling, "De Aleatoribus," and the Jewish Mishnah disqualified a gambler from testifying before a court of law. But in this matter even we have not reached that standard, and most of our older colleges were founded with the help of lotteries. In the Philippines we will have to go a bit slower in legal reforms than we can here.

Secretary Hitchcock's rules for the leasing of the rich oil lands of the tribes in Indian Territory are reasonable ones. They will not be revoked at the demand or suggestion of ex-Senator James K. Jones or any speculator in oil leases who has violated them. This ought to be understood by Governor Higgins, who must see that the Secretary's policy is in accord with the views commonly reported to be held by the President concerning the withdrawal from public entry of all the unsold mineral lands in the public domain.

Mr. Shonts, who has the task of digging the canal, tells the President that conditions on the Isthmus have much improved. Certainly, for they needed it sadly, and the task was vigorously entered on after our correspondent told a fragrant story with pictures. The President will find Panama in very fair sanitary condition when he comes there; and we hope he will see the dust fly.

By an unfortunate mistake the names of Dr. P. H. Eykman and Paul Horrix were transposed under their portraits in connection with the article by the former on "Internationalism and the World's Capitol" in our issue of July 26th.

Both political parties in Arizona are opposing joint Statehood with Oklahoma. That was what we all knew they would do, and it was unnecessary to hold elections to find out. Let Oklahoma come in and let Arizona wait.

Insurance

Decision for the Mutual

A DECISION was handed down on Saturday last by Justice Howard, sitting in Troy, N. Y., that is favorable to the administration ticket of the Mutual Life Insurance Company and the State Superintendent of Insurance in the action brought by policy-holders to compel the State Superintendent to strike names from the administration ticket. As previously set forth in this department, the Mutual Life directors nominated an administration ticket and placed upon it names that included the following members of the International Policy-Holders' Committee, viz., Col. Alfred M. Shook, Judge George Gray, of Delaware; Gen. Benjamin F. Tracy and Harlow N. Higinbotham, all of whom, it is alleged, were well known to be opposed to the policy of the board of directors.

It will be recalled that Colonel Shook and the others named protested against the use of their names on the administration ticket, claiming that they were placed thereon without their knowledge or consent, and for the purpose of deceiving those inclined to be supporters of the policy-holders' ticket. The administration supporters, according to Colonel Shook and his associate plaintiffs, seek to impose upon the policy-holders in general by leading them to believe that the entire ticket made up by them is of the high character of the four gentlemen named, and that these gentlemen approved the policy and methods of the administration, which, in point of fact, was not the case.

Because of the alleged deception and of the protest of Colonel Shook and his associates, the court was asked for an order directing the State Superintendent of Insurance to strike from the administration ticket the names of Messrs. Shook, Judge Gray, General Tracy and Higinbotham. The application for a writ of mandamus was denied by Justice Howard on legal grounds, the Justice taking the position that the State Superintendent of Insurance is not required by law to do what the petitioners ask, and cannot be directed by a court to do a thing the law does not require him to do.

Justice Howard's decision, unless it is reversed, means that these four men will have to stand for election on the Mutual's administration ticket, altho they all refused to accept the nomination thru their counsel, Samuel Untermyer. In the event of the administration ticket being successful and Colonel Shook and his associates refusing to serve, their successors will, of course, be chosen by the board of trustees. Colonel Shook will take an appeal from the Howard decision at once, and it is expected that a decision will be had from the higher court by September 1. Incidentally the Howard decision discloses a serious flaw in the Armstrong committee laws, as members of the committee say that it was never intended that a man's name could be forced upon a ticket against his wish. The Howard decision is a victory for the Mutual lawyers.

The executive committee of the international committee met on Friday last and made quick work of the resignation of Seymour Eaton as secretary, which was offered on August 9th. Six of the committeemen were in attendance, as follows: Judge Alton B. Parker, Governor Henry Roberts, of Connecticut; Harlow N. Higinbotham, Governor Pennypacker, of Pennsylvania; J. C. Hemphill, and Edward E. Clark, of Ohio. This letter, signed by Judge Parker as chairman of the executive committee, was sent to Eaton, who is supposed to have gone to his home in Philadelphia:

> DEAR SIR—I am directed by the Executive Committee of the International Committee to say that, while surprised that you should make known your intended resignation to the public at midnight before sending to the committee a resignation which does not attempt even to give any reason for your action, and at your neglect to come before the committee today as requested—we are satisfied that your resignation, which we accept, comes none too soon.
>
> As to your clerk, Liebfried, he is not treasurer of the committee, and no one knows it better than you, who unsuccessfully urged upon the members of the committee his selection for that position.

THE Pawtucket Mutual Fire Insurance Company, of which Dr. A. A. Mann is president, and whose net surplus is $254,277 and the assets $452,151, has moved into their new building at Pawtucket, R. I. The Pawtucket Mutual was incorporated in 1848.

Financial

Great Crops of Grain.

In the Government's latest crop report the first official (preliminary) estimate of the yield of winter wheat is made. The quantity, 493,434,000 bushels, caused some surprise, because the trade estimate (based upon the condition percentages previously reported) had been only 429,534,000. It appears that the Government's figures are based upon reports of estimated average yield per acre in each of the eleven principal winter wheat States, the average for all of them being 16.7 bushels, against only 14.3 last year. So it comes about that we have 65,000,000 bushels more this year than were harvested last year on a larger area. This official estimate indicates the greatest wheat crop (772,264,000 bushels) ever known in the United States, exceeding the great crop of 1901 by 23,800,000 bushels, and last year's by 79,000,000. The same report points to an increase of last month's estimate of the corn crop, which will probably surpass last year's and break the record. Canada's wheat harvest is now at its hight. Last year's yield was 83,000,000 bushels; this year's will be about 100,000,000.

Chicago's Broken Bank.

An important purpose for which State Banking Departments are maintained and bank examiners employed is to prevent such robbery of depositors as has been disclosed by the collapse of the Milwaukee Avenue State Bank in Chicago. Here was a bank holding deposits of more than $4,000,000, of which $2,000,000 was in the savings department and was due to 22,000 persons, nearly all of them poor. The president—who, with his family, controlled the institution—was notoriously engaged in many speculative ventures and was a plunger at horse races. Since 1901 he had been robbing the bank by a series of bold forgeries, using fictitious names and also those of real depositors upon notes and other papers, a great mass of which he left in his strong box when he ran away. Thus he had stolen between $1,000,000 and $2,000,000. One ruined depositor fell dead; another committed suicide; the paying teller, who appears to have been innocent, killed himself because the reproaches of depositors became intolerable.

Bank examiners are sometimes blamed unjustly. It is impossible for the best of them to detect certain kinds of fraud that have been skillfully covered up. There seems to have been no sufficient excuse in this instance, however, for the failure of the Illinois examiners. Stensland's speculations and manner of living should have suggested careful inspection. The methods by which he stole the money were clumsy, but he used them successfully for five years. The fact that nearly all the depositors were poor persons who had placed their little savings in the bank should have caused the State to exercise much care for the protection of their interests. The Banking Department must have failed to do its duty. What is the use in having a State Banking Department if it cannot prevent such plundering of the poor continuously for five years by a speculator, gambler and race-track plunger?

Pittsburg is to have a day and night bank.

....July's output of pig iron was 2,013,402 tons, against 1,976,733 in June, and 1,741,935 in July of last year.

....At an early date the Lackawanna Railroad will dispense with the services of telegraphers on its lines and will control the movement of trains by an automatic block signal system and additional telephone facilities.

....A fourteen-foot vein of Lykens red ash coal was uncovered a few days ago at Taylorsville, Pa., by prospectors of the Reading Company. It contains millions of tons of anthracite of the highest quality and may be worth $20,000,000.

....For the site of the coming city of Gary, Ind., the United States Steel Corporation paid $1,926,065. This tract of 2,793 acres was assessed four years ago at $243,950. Within the next eight years the corporation will probably spend $75,000,000 on it.

The Independent

VOL. LXI NEW YORK, THURSDAY, AUGUST 23, 1906 No. 3012

Survey of the World

Political Topics

There has been published a long letter addressed by President Roosevelt to Representative Watson, of Indiana, concerning the work of Congress at its recent session, and the issues of the Congressional campaign. The House, Mr. Roosevelt says, "has accomplished a literally phenomenal amount of good work," and has shown such courage, good sense and patriotism that a failure of the country to recognize these qualities would be a real and serious misfortune. To change the leadership and organization of the House at this time would "bring confusion upon those who have been successfully engaged in working out a great and comprehensive scheme for the betterment of our social, industrial and civic conditions." He hopes and believes that at the coming short session the bills prohibiting political contributions from corporations, reducing the duties on imports from the Philippines, and limiting the number of hours of labor for railway employees, will be enacted into laws. Pointing to the Railroad Rate, Pure Food and Meat Inspection acts, he says that Congress in this legislation "acted in the exact spirit of Abraham Lincoln." These laws, while arousing "the deepest anger of the reactionaries who make a fetich of wealth, have not satisfied the unwise extremists." Concerning the tariff, he says:

"We stand unequivocally for a protective tariff, and we feel that the phenomenal industrial prosperity which we are now enjoying is not lightly to be jeopardized; for it would be to the last degree foolish to secure here and there a small benefit at the cost of general business depression. But whenever a given rate or schedule becomes evidently disadvantageous to the nation, because of the changes which go on from year to year in our conditions, and where it is feasible to change this rate or schedule without too much dislocation of the system, it will be done. The question of revising the tariff stands wholly apart from the question of dealing with the so-called Trusts—that is, with the control of monopolies and with the supervision of great wealth in business, especially in corporate form. The only way in which it is possible to deal with those Trusts and monopolies, and this great corporate wealth, is by action along the line of the laws enacted by the present Congress and its predecessors."

——Speaker Cannon was nominated for the eighteenth time at Danville, on the 16th, and his Republican constituents also named him for the Presidency. In his address to the convention he argued at length in support of protection and of the present tariff law, which, he said, was the most perfect and just customs revenue statute ever enacted. Speaking of the anti-injunction legislation demanded by Mr. Gompers and the Federation of Labor, he said that he should oppose it at all times. As for the members of the labor unions, he was ready to take his chances with them in politics.——Senator Cullom, of Illinois, says that Mr. Cannon made an excellent speech, but was "a little too stiff" in support of the present tariff. A few of the schedules, the Senator thinks, could be reduced with benefit to our business interests.——In Massachusetts, the Democratic leaders have agreed to promote the nomination of Henry M. Whitney for Governor and of Congressman John A. Sullivan for Lieutenant-Governor. Mr. Whitney is a prominent advocate of tariff revision and of reciprocity with Canada. This agreement will prevent the nomination of Mr. Moran, Boston's active District Attorney,

who has the nomination of the Prohibitionists, and who has proposed (in vain) to Mr. Whitney that their respective claims to the Democratic nomination be referred to Mr. Bryan for a decision. On the Republican side it is expected that Governor Guild will be renominated. In a letter to President Roosevelt, last year, he said that a great majority of the people of Massachusetts wanted an immediate revision of the tariff, and that he himself would have been defeated if the Republican State platform had not called for such revision. The Home Market Club, a protectionist organization, is now circulating a petition which says that "immediate revision is inadvisable." This petition, with its signatures, is to be laid before the platform committee at the coming convention, and the club hopes that it will prevent a repetition of the tariff utterance, which was in accord with Governor Guild's views.

Railroad Rate Questions

By the appointment of James S. Harlan, of Chicago, the last vacancy in the Interstate Commerce Commission has been filled. The other new members are Franklin K. Lane and E. E. Clark. Mr. Harlan is a son of Justice Harlan, of the Supreme Court. He is a lawyer, and for a time was Attorney-General of Porto Rico.——The Lake Shore road gives notice in a circular recently issued that independent oil companies will hereafter be required to pay such freight charges as the Standard Oil Company has paid in the past. This concession to the independents is regarded by the Government as an admission of the correctness of the accusation made in the Garfield report.——The Pennsylvania road's reduction of passenger rates to 2½ cents a mile has not checked the movement in Pennsylvania for a reduction to 2 cents by legislation. We recently pointed out that all the political parties in the State were committed by their platforms to the support of such legislation. A demand for it has since been made in many county conventions, and all but three of the men nominated for the Legislature are pledged to vote for a 2-cent bill. The passage of such a bill appears to be assured. Virginia's 2-cent law was recently held to be unconstitutional, because it was not of general application, but related only to ticket books for 1,000 miles of transportation. ——At a meeting of the Ohio Bankers' Association, last week, Melville E. Ingalls, president of a national bank in Cincinnati and chairman of the board of the Cleveland, Cincinnati, Chicago & St. Louis Railroad Company (of which he was formerly president), declared that the greatest menace to American business were the national trade laws, especially the Sherman Anti-Trust law and the new Railroad Rate law. In his opinion, they restrained the development of the United States. If they should be enforced the result would be financial disaster, and shippers and merchants would demand that they be changed. Moreover, the profitable management of railroads would be made so difficult by this legislation that eventually Government ownership would be forced upon the country.

Movements Against Trust Combinations

In Boston, six ice companies and seventeen persons (officers and members of the Massachusetts Ice Dealers' Association) have been indicted for conspiracy to fix and exact high prices. An official report of the Rhode Island Bureau of Industrial Statistics asserts, that for the last four years the output of ice in Maine has been systematically restricted and reduced by the American Ice Company, which controls the greater part of the facilities and privileges where ice is cut there. The output formerly was about 1,500,000 tons; in recent years it has been less than 500,000. It is asserted that the restriction has taken place since the formation of the combination or Trust. Colonel Webb, who wrote the report after making an investigation in Maine, has been asked to testify before the Grand Jury in New York, which is still pursuing its inquiries, apparently somewhat at variance with District Attorney Jerome, altho he admits that there has been in New York a technical violation of the law against conspiracy and combination. In Toledo, where several ice dealers were sent to jail, the Interstate Commerce Commission is now taking testimony as to freight rate discrimination in favor of

one of the ice companies by the Ann Arbor Railroad, the officers of which owned most of the ice company's stock.——Ex-Judge Gordon, as counsel for Oil Inspector Edwards, of Philadelphia, has complained to the Attorney General of Pennsylvania that the local branch of the Standard Oil Company obstructs Edwards in the performance of his duties. Asking that the Attorney General proceed against the company, he and the inspector assert that the company sells oil that is falsely branded, as to quality, that it refuses to pay the lawful inspection fees, and that inspection in the past has been a farce, Edwards's predecessor having accepted (it is alleged) $4,000 a year in lieu of fees, and having failed to attend to the duties of his office.——Prosecutions designed to prevent the use of adulterated glucose in candy sold in Philadelphia are regarded there as hostile to the Standard Oil Company, because it is said there that this company controls the manufacture of glucose. More than thirty persons, manufacturers of candy and sellers of it at retail, together with certain sellers of glucose, have been arrested upon the complaints of Dr. Warren, head of the State Dairy and Food Commission, for selling adulterated glucose or adulterated candy. The Commission's chemist asserts that excessive and probably harmful quantities of sulphites are found in both. It has since been announced by the Corn Products Refining Company (manufacturers of glucose) that because of these legal proceedings in Philadelphia, the use of sulfur dioxide in the process of manufacture will be discontinued. The company had been assured by chemists that the quantity contained in the product was harmless.

Recent Lynchings in the South

Robert Davis, a negro, was lynched in Greenwood, S. C., on the 16th, four days after the conviction at Salisbury, N. C., of George B. Hall, who was sent to prison for fifteen years for leading a mob that lynched three negroes at that place. Davis had committed an assault upon Miss Jennie Brooks, a young white woman, the daughter of a Greenwood merchant, and afterward had attacked a young negro girl. Those who captured him were preparing to burn him at the stake when Governor Heyward, who had come hurriedly from the capital, addressed them from an improvised platform, urging that the law be permitted to take its course and promising that the man should be tried within two weeks before a Greenwood jury. He was cheered by the lynchers, but at the same time they expressed their determination to kill Davis. Their only concession was the substitution of shooting for burning. In answer to her own request, the mother of the injured negro girl was permitted to fire the first shot. The negroes of Greenwood County have published an address denouncing Davis and expressing approval of the lynchers' action.——It appears that the Salisbury militia had ball cartridges when on guard at the jail from which the three negoes were taken, on the 6th, and that the sheriff gave orders that they should not be used. It is reported that Governor Glenn will issue an order instructing military officers to act upon their own responsibility in such cases, when a sheriff refuses to direct that force be used for the protection of prisoners. Hundreds of souvenir postal cards, bearing photographs of the lynched negroes as they were hanging from the trees, were held at the Salisbury post office until the Department at Washington should decide whether they could be forwarded in the mails. The decision was that they were not mailable. By the North Carolina press generally the lynching of the negroes at Salisbury is denounced and the prosecution and punishment of Hall are approved. On the other hand, the Atlanta *News,* owned by Governor Terrell's chief of staff, says that "nothing short of the stake would have meted proper punishment to" the negroes lynched at Salisbury, commends the Greenwood lynchers, and offers $1,000 reward for the lynching of any negro who assaults a white woman in Atlanta. On the 20th, three days after this offer was made, a mob, intent upon earning the reward, was hunting in Atlanta for a negro accused of assaulting two young white girls, Ethel and Mabel Lawrence, daughters of a well known citizen.

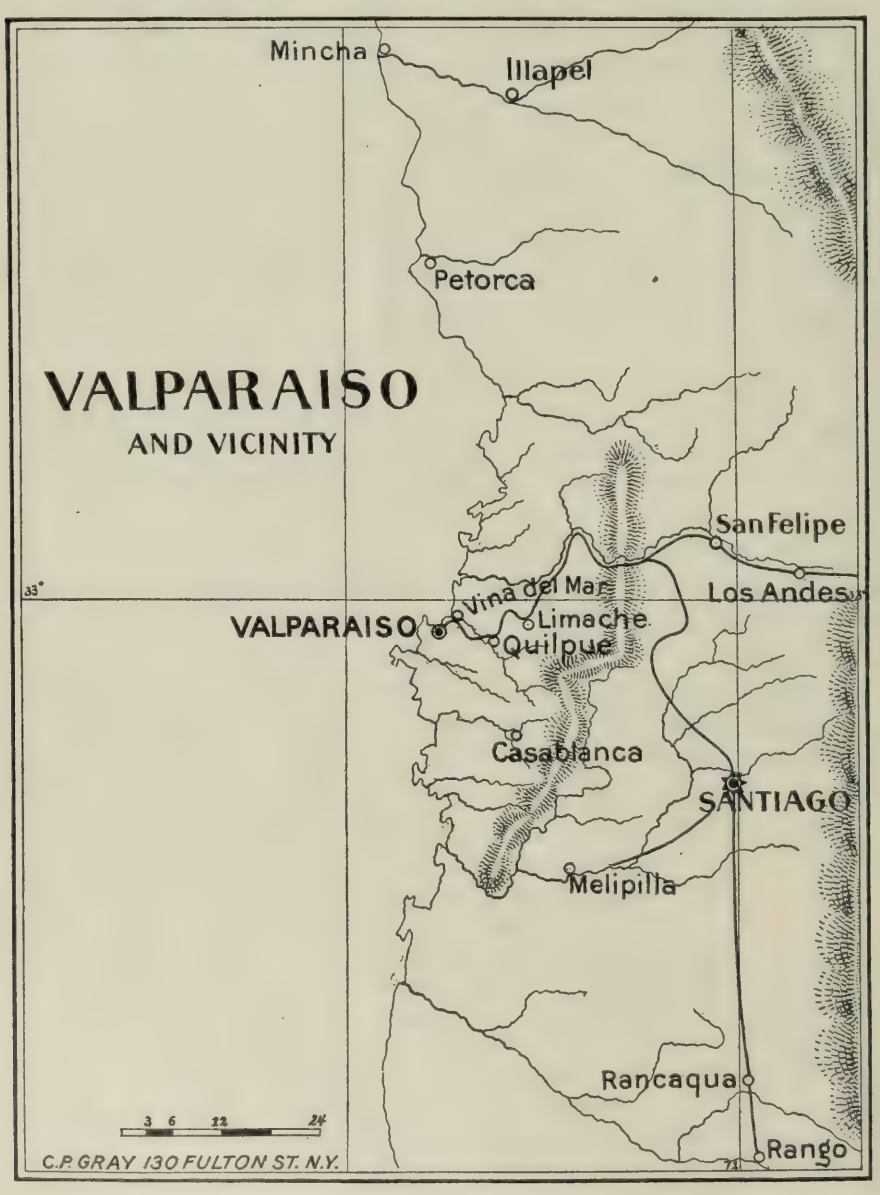
The Negro Soldiers at Brownsville

In response to the repeated requests of Senators Culberson and Bailey and the leading residents of Brownsville, Tex., the President, after making an investigation, has ordered the immediate removal of several companies of the Twenty-fifth Infantry, a negro regiment, from Fort Brown (which is near Brownsville) to Fort Ringgold. It was asserted by the Brownsville authorities that one of the negro soldiers assaulted the wife of a white citizen, and that several of them, a few days later, attacked the people of the place, killing a man named Frank Natus and wounding a policeman. The report made by Major Penrose, the commander of the post, says that negro soldiers were insulted in Brownsville a few weeks ago, soon after their arrival from Nebraska; that a respectable citizen did present evidence of an attack upon his wife by one of them; and that about ten of the negroes participated in the disturbance or race riot which resulted in the killing of Natus. About 100 shells of such cartridges as are used in the army rifles were picked up in the streets after this controversy. Major Penrose has been unable to discover who the offending soldiers were. It is indicated by the report that the race riot took place because the negro soldiers had been publicly insulted and abused in Brownsville by residents of the place.

An Alarming Revolt in Cuba

Several prominent Liberals were arrested and imprisoned on the 19th, the charge being that they were conspiring against the Government and plotting to assassinate President Palma. Those arrested at Havana were General Carlos Garcia, Velez Garcia and General Justo Garcia (sons of the late General Calixto Garcia); General Monteagudo, General Loynaz del Castillo, formerly a member of the House; Colonel Alberti and Colonel Pedro, chief of police in the House. Loynaz del Castillo escaped from the custody of the police as they were taking him to jail. Those arrested at Santiago were Demetrio Castillo, formerly Governor of the province, and Juan Gualberto Gomez, the well-known negro orator, who is one of the editors of *La Lucha*, in Havana. They are charged with inciting the people to revolution. Warrants are out for many others. Within the last few days the rural guards have encountered in the interior three or four small bands of outlaws or revolutionists. On the night of the 19th, General Quintin Bandera, formerly a noted insurgent leader, took command of a band of twenty insurrectionists at a point twelve miles west of Havana, and it is said that these were joined by a considerable number from the city. Carlos, one of the three Garcia brothers, was Minister to Mexico until eight months ago. Because he criticised the Government in letters to the press he was forced to resign. His brothers followed him into private life. One had been Consul at Hamburg and the other had been attached to the Legation at Rome. The three, with Gomez, are said to have been the leaders of the revolutionary movement, which has grown out of the disaffection of the Liberals during the campaign preceding last year's Presidential election. On the 20th the situation became more serious. President Palma ordered that the number of rural guards be doubled, making the entire force 4,000 men. In the afternoon twenty rural guards were attacked by Bandera's followers, twenty miles from Havana, and Lieutenant Roque, the commander of the guards, was killed. Governor Nunez happened to be present. At last reports (on the 20th) the center of the uprising appeared to be in Pinar del Rio, where, it was said, Pino Guerra was in command of 800 insurgents. A rumor that José Miguel Gomez, recently the Liberal candidate for the Presidency, had taken the field with 600 men was denied. The discovery of a conspiracy at Matanzas had been followed by several arrests there.——The claim of the Hormiguero Company for $769,000 has been rejected by the Spanish Treaty Claims Commission at Washington, which allows only $10,000. In December, 1895, the company's sugar plantations were destroyed by the Cuban insurgents. It was claimed by the company that this raid could have been prevented by the Spanish forces.——Five thousand Porto Rican workmen, members of the Federa-

tion of Labor, have sent to President Roosevelt a signed statement, asserting that the insular Government is unjust in its treatment of organized labor. The police, they say, are in league with capitalists and used their power in behalf of non-unionists during the recent strikes. The Federation asks both political parties in the island to permit it to name seven candidates for the House at the coming election.——Louisiana planters continue to import laborers from Porto Rico; one hundred sailed last week from Arecibo.



The Philippine Islands

During his recent visit to the island of Leyte, Governor Ide held a conference with the mayors of fifteen towns. They promised to assist the military authorities in exterminating the Pulajanes. It appears that there are not many of these fanatical outlaws, but they have compelled a considerable number of farmers to take part in their raids, threatening to kill them if they should refuse to do so. Governor Ide has appointed a commission—consisting of Governor De Veyra, Brigadier-General Lee, Colonel Tyler (of the constabulary) and three mayors—to visit certain districts, hold public meetings, and urge the people to co-operate with the authorities in their movement against the outlaws.——Two years ago the Lukban brothers, Vincente and Cayetano, were tried for conspiring against the Government and sentenced to be imprisoned for five years. They were associated with Ricarte. Vincente had been an insurgent leader in Samar some years earlier, and his brother was at one time secretary of the Filipino revolutionary Junta at Hong Kong. Upon appeal, both have now been acquitted by the Supreme Court of the islands, no judge dissenting.

Valparaiso Ruined by an Earthquake

On Thursday evening, August 15th, the Chilean coast was visited by an earthquake which nearly destroyed the city of Valparaiso and other cities in the vicinity. In extent and character the earthquake was similar to those of Alaska and San Francisco, and was perhaps due to the same general cause, as all three are on the same seismic zone, the western slope of the Pacific coast range. Judging by the seismograph records made in all parts of the world the last must have been the most deep-seated and severe of the three. Its center seems to have been at or near Valparaiso, for the towns most injured are within 100 miles of that city; but the damage extended as far south as Concepcion, as far east as Los Andes and Tucuman, on the other slope of the Andes in Argentina, and as far north as Arica, near the Peruvian boundary. The first shock occurred at 7.15 in the evening and was followed a few minutes later by a second still more severe and then by tremblings lasting for five hours. The gas and water mains were broken and the city plunged into complete darkness, as the night was cloudy and rainy, but the scene was soon illumined by the fires that broke out in many places and swept the city, as there were no means to quench them. As in San Francisco the business quarter of the city was built on made ground around the harbor and this suffered most, but many of the residences, which occupied terraces on the sides of the amphitheater of hills 1,700 feet high enclosing the bay, were destroyed by landslides. The older quarter, in which are the municipal buildings and custom house, was least injured, but it is reported that scarcely a block in the city escaped damage. The loss of life is not yet known, but the earlier reports, which estimated it at many thousand, are questioned. A more probable estimate is less than 200. The Government will be asked for $100,000,000 to rebuild the city. Valparaiso had a population of 142,000. The inhabitants, fleeing from the city, took refuge in the hills, where they suffered much from cold and hunger, for it is the dead of winter and the hills are covered with snow. Meat and bread could hardly be obtained at any price, and there was not even drinking water. The sailors from the Chilean fleet, which had assembled at Valparaiso to do honor to Secretary Root, were landed the next day, and took charge of the city, to guard the wrecked banks and warehouses. Many looters were caught and shot. Railway communication with Santiago and the south was broken, so

relief was slow in coming. Santiago, the capital of Chile, seventy-five miles southeast of Valparaiso, was also badly shaken. Many building were demolished and some thirty persons killed. The loss there is estimated at $1,500,000. Other towns reported destroyed or very much injured are: Casablanca, 15,000 inhabitants; Quillota, 50,000; San Felipe, 35,000; Quirihue, 45,000; Petorca, 30,000; and Limache, 25,000. Arica, a town of 3,000, which was wiped out, had a singular earthquake history. In 1868 a tidal wave forty feet high carried the United States warship "Watres" a half-mile on shore, and in 1877 the ship was borne by another wave two miles inland and left in the sand dunes. It was this earthquake that interested Professor Milne in the subject and led him to establish a recording station in Japan, where he then was, and later in the Isle of Wight. Hawaii was visited by a tidal wave five feet high, caused by the Valparaiso earthquake, which carried away a wharf and broke the mooring chain of a steamer.

The scene of the great Chilean earthquake of the night of August 16th. All of the towns named upon the map were injured by the shock and some of them were destroyed.

A Political Crisis in France

The conflict between Church and State in France has reached a critical point and the Pope's refusal to accept the legal regulations of the French Government for the organization of the Church after its separation from the State, has brought the opposing parties into a deadlock, which must have serious consequences for the country. M. Briand, Minister of Public Worship, declares that he will never go to Canossa, apparently forgetting that Prince Bismarck made the same boast at the beginning of a *Kulturkampf*, in which he was finally forced to compromise with the Church he challenged. If the present French Government should show any such disposition to compromise, it would undoubtedly be dismissed from office by the Chamber of Deputies, which is emphatically anti-clerical. On the other hand, the Pope declares that he cannot accept the provisions of the Separation Law without betraying his sacred charge and causing the ruin of the Church in France. The law providing for the separation of Church and State, which passed December 9th, 1905, provides that the churches and other buildings for religious worship shall be turned over to the local Cultural Associations, composed of laymen of the place, who will be responsible for

the property and required to see that it is used solely for religious worship and not for political or other purposes. A meeting of the Bishops and Archbishops of the French Church was held to consider the situation, and altho the proceedings were secret, it is believed that the majority of them favored the acceptance in general of the conditions imposed upon them, altho protesting against the law. The Pope in the encyclical just issued to the French hierarchy, declares that it is absolutely inconsistent with the constitution of the Church in that it deprives the bishops of the control of the church buildings.

"We deferred our decision owing to the importance of this grave question, and particularly thru a charitable feeling for the great services your nation has rendered to the Church. Having heretofore condemned this iniquitous law, we examined with the greatest care its articles to see of they permitted of the organization of religious life in France without jeopardizing the sacred principles of the Church."

The Pope decides that the Cultural Associations "cannot be formed without a violation of the sacred rights which are the very life of the Church." The Pope then considers at length other possible forms of association and declares:

"It is not permissible to try these other kinds of association so long as they do not establish in the most legal and most positive way that the divine constitution of the Church, the immutable rights of the Roman Pontiff and the Bishops, and their authority over the temporal affairs of the Church, particularly the sacred edifices, will be irrevocably protected by such associations. We cannot wish otherwise without betraying our sacred charge and producing the ruin of the Church in France."

"The makers of this law have not sought separation, but oppression. While affirming their desire for peace they have made atrocious war against religion. They hurl a brand of the most violent discord, thus arraying one citizen against another, to the great detriment of public welfare. We have supported patiently injustice after injustice thru love of the French nation, and are finally asked to overstep the last limits of our apostolic duty, and we declare our inability to overstep them. Let the responsibility rest with those whose hatred has gone to such extremes.

"In the hour of hard trial for France if all unite in defending the supreme interests of the country the salvation of the Church is far from desperate. On the contrary it is to be hoped that her dignity will be raised to its former prosperous hight."

The encyclical puts the French hierarchy in a very difficult position, as it makes it impossible for them to comply with the law as it stands. Their loyal acceptance of the decision, however, is expressed in the following words of the Archbishop of Paris: "The Pope has spoken and we bow with submission and joy to his instructions." The Pope's words suggest that some modifications might be made in it which could be accepted by the Church, but there is no evidence that the Government will consent to any compromise. The law goes into force on December 11th, and unless Cultural Associations are formed which take possession of the ecclesiastical property by that time it will revert automatically to the State.

Anti-Greek Riots in Rumelia

As reprisals for the depredations of the Greek bands on the Bulgarian cities in Macedonia, the anti-Greek movements in Bulgaria are acquiring great force. A mass meeting of 10,000 people was held in Sofia on August 5th at which the Government was asked to suspend diplomatic relations with Greece, to expel the Greek clergy from Bulgaria and to boycott Greek trade. In several cities of Eastern Rumelia, which since the revolution of 1885 belongs to Bulgaria, anti-Greek riots have broken out. At Philippopolis the Bulgarians seized three of the Greek churches and plundered the Greek shops. Several persons were killed in the street riots. The Greek appealed to General Ivanoff, commandant of the place, to protect their property, but the troops did not succeed in dispersing the mob, altho they fired some volleys of blank cartridges at them. The Bulgarian officials gave sanction to the action of the mob by attending mass in the churches which had been forcibly appropriated. At Ahiolu, a town on the Black Sea in Eastern Rumelia, forty-eight miles from Varna, the fighting between the races was prolonged and furious. It began by an anti-Greek procession by the Bulgarians which was fired upon by the Greeks. The Bulgarians then set fire to the town, which was in several places, and it was largely destroyed. The Bulgarian Minister of the Interior, who investigated the affair, reported that the Greek Metropolitan was chiefly responsibile for the outbreak. The Metropolitan

and forty other Greeks and Bulgarians were arrested for participating in the riots. The Bulgarian Government will rebuild the houses burned at Ahiolu. The Porte has sent a circular letter to the Powers stating that the Grand Vizier had remonstrated with the Bulgarian agent at Constantinople on account of the mistreatment of the Greek Christians whom Turkey is empowered to protect. In response the Bulgarian agent reproached the Porte for its failure to protect the Bulgarians in Macedonia.

Terrorism and Oppression in Russia

The closing of all avenues for legitimate political progress in Russia has given occasion for a reign of crime in which political and personal motives are indistinguishable. Robbery, murder and arson are rife in all parts of the empire. According to the last weekly official report fifty-eight officials were assassinated and forty-three were wounded in Russia proper. The police are resigning in large numbers because of the constant attacks of the revolutionists. According to the St. Petersburg *Gazette* 2,300 persons were banished from the capital last Saturday. Fifty bomb depots were discovered in the week. The authorities claim to have broken up the revolutionary organization in Moscow by the capture of its headquarters, in which eighty pounds of dynamite and 3,000 rifle cartridges were found, as well as plans for a national uprising. Warsaw is the center of the worst disorder, for there the revolutionists and the police hunt each other thru the streets and almost all business and traffic has ceased. On August 15th twenty-eight police officers and soldiers were killed in Warsaw and as many more wounded. In retaliation the soldiers fired upon the crowd, killing thirteen men and two women and wounding 165. It is reported that over 300 Jews in Warsaw have been massacred. Except in Poland, however, the general attitude of the people is apathetic. They manifestly want to be let alone, as they feel that they have suffered enough from political causes in the past year, and now they want to enjoy themselves. Social life in the great cities is gayer than ever and a general loosening of the bonds of moral restraint is noticeable. The Court festivities have been revived on a grander scale and the Imperial family attend the races and theaters. The Czar spent four days with the troops at the maneuvers at Krasnoye-Selo, and owing to the stringent precautions of the police there was no manifestation of revolutionary feeling.

Two Saharan Oases

The Porte, checkmated by Great Britain in its recent attempt to enforce its claim to the disputed territory of the peninsula of Sinai by the occupation of Taba, is now trying the same kind of a game on the southern frontier of the French possessions in Tripoli. The French Consul at Tripoli reported to his Government that an expedition of forty men under Adjutant-Major Abdul Kader Jami was to be dispatched to the oases of Janet and Bilma in the Sahara, and the French Ambassador at Constantinople filed a protest against such action. The Porte professed ignorance of the matter, but after three such notes of remonstrance had been presented it admitted that such an expedition was to be sent and justified the action on the ground that the inhabitants paid tribute to Turkey as part of the vilayet of Tripoli and that a holy flag was preserved at Janet. The Turkish Government has never agreed to the Anglo-French convention of 1898, by which two-thirds of the desert is recognized as being within the French "sphere of influence." France holds that Turkey has never had troops in that region, never collected taxes or exercised any authority there, and will defend the Tripolitan *Hinterland* against any aggressions. The oases are not important in themselves, as they lie aside from the caravan routes, but are regarded as of strategic value like islands in the ocean. Janet has only once been visited by a European, Captain Touchard, who passed thirty-six hours there in January, 1905. It comprises six villages of 1,200 inhabitants altogether, divided into two clans and possessing 20,000 palm trees. Bilma is better known. It is the most important of six little oases known as Kasuar, containing about 2,000 inhabitants.

"The Impending Conflict"

BY GOLDWIN SMITH, D. C. L. (OXON.)

"THE Impending Conflict" is the ominous title of an alarmist article, not the only one of its kind, in a leading periodical. In the industrial sphere a conflict may unhappily be said already to exist. It would become general if the appeals of certain speakers and writers to class-hatred and revolutionary sentiment could take effect. Extravagant misrepresentations of the attitude of the wealthier class toward the less wealthy, and of the condition of the less wealthy, are circulated in language which, by its splenetic violence almost reminds us of the declamations of Marat. The wage-earning artisan, living in a comfortable home of his own, with bread enough, and domestic happiness, master of his labor, and in the full enjoyment of his political franchise, is depicted as a slave robbed and trampled on by a tyrannical master, and is urged to rise and put a torch to the edifice of social injustice.

There is thunder, no doubt, in the social air, enough to make us wary, tho not to make us hysterical. There is a general ferment of opinion, with a strong element of discontent, thruout the civilized world, arising from the advance of democracy, the liberation of opinion and of the press, the extension of popular education, and the increase of international communication, which gives electrical circulation to all novel and revolutionary ideas. All institutions and beliefs are being emulously called in question. Plans for the reconstruction of the social edifice abound. The last offspring of revolutionary speculation is Anarchism, with its bomb, frankly embracing the work of universal destruction and leaving the work of reconstruction to the chances of the future. In the composition of anarchism, however, it is probable that the passion for conspiracy and the excitement of wielding a terrible and mysterious power bear as large a part as revolutionary speculation.

The inequalities of the human lot are shocking to our abstract sense of justice, and could not fail, when social speculation became very active, to provoke theoretic revolt. But the inequalities of wealth are not the only inequalities; they have themselves sprung in large measure from other inequalities with which no social revolution could do away; inequalities of bodily and mental powers, of character, of opportunity. In no sphere does equality seem to be the law of nature. Inequality, on the contrary, seems to be the universal law, and on it progress appears to be dependent.

This is no excuse for resting in social usurpation or injustice. But it seems to be a reason for limiting our expectations of universal bliss to be attained by leveling revolution.

Is not a main cause of the social disturbance to be found in the decay of religious faith, notably among the quick-witted artisans? Hitherto the belief has generally prevailed that the social system, with its classes and grades, was a dispensation of Providence, and that those who patiently accepted their parts and did their duty under it, if they were poor here, would be rich hereafter. This belief, if it has not departed, is apparently departing from active minds. The terrible inequalities of the human lot now glare upon the heart of the toiler without countervailing hopes. He thinks, not unnaturally, that if this world is all, he will try to get his full share of it, and resolves to use his political power, in some countries newly acquired, for the purpose of social rectification. There are some who deny the existence of this in-

fluence or hold that it has been greatly over-rated; that the belief in a Providential dispensation, with future rewards and punishments, has had little practical effect; and that we need not be alarmed by its departure. It may not have been distinct and vivid. It may not have been habitually present to common minds. But impregnated as all language has been with it, constantly as it has been presented to the mind and eye by religious institutions, it must surely have had great influence. Social science may hereafter take its place. But the social science which should convince manual labor that patient acquiescence in its lot is true wisdom has probably yet to be constructed; and it will be some time before anything scientific can take firm hold of the proletariat mind. As to the high ethical motives which, we are told, have enabled and will continue to enable choice spirits to soar above the self-interest to which the doctrine of future reward and punishment appeals they are native to choice spirits alone.

In the sphere in which the conflict may be said to have already begun—that of manual labor—there was a real and crying grievance; at least in countries where combination laws or anything equivalent to them prevailed. The employers were naturally combined, and to secure fair wages, and fair treatment in other respects, combination was necessary on the side of the employed. A workingman at the mercy of the employer, as he was under the British Combination Laws, might without flagrant exaggeration be called a slave. There can be no doubt as to the general effect of the trade unions in securing justice for the workingmen or as to their title to recognition and reasonable protection by the law. But the great power thus called into existence, righteous as its origin might be, was not likely to keep within the strict bounds of right, especially when the unions were combined into great leagues and fell under the sway of ambitious leaders whose field was industrial war. Suppression of the freedom of labor in the interest of self-instituted associations is plainly what the community cannot endure; and if it is to be sought by violent means, a conflict does really impend and will unquestionably come. But the unions may become in time sensible of the fact that their members are consumers as well as producers, and that in forcing up the rate of wages in all trades beyond a reasonable point they would be either ruining the trade or raising the price of all the articles against themselves. Meantime by the industrial conflict much class-bitterness is excited, and any revolutionary tendencies which may exist are apt to be drawn to a head. If there is immediate danger of a social conflict it is probably in the industrial quarter.

A feature of the age which helps to inflame class-discontent and jealousy is the growth of the millionaire. It seems that every great economical change, however beneficial in its ultimate results, must have its drawbacks at the time. The elision of the middle-man cheapens goods but kills retail stores. Machinery has vastly increased the wealth of the world, but brought with it the evils of factory life. The peculiar drawback of an age of great works and commercial enterprises, highly beneficial in themselves to every nation and to the world at large, has been the creation of the millionaire. Beyond question the growth of millionairism is an evil, inordinate wealth carrying with it, as it does, sinister influence, besides the gambling of the Stock Exchange and the frauds of the financial buccaneer. Some of the great fortunes have no doubt been made by means more or less immoral. These President Roosevelt would forfeit to the State. But he would find discrimination difficult, tho confiscation would be easy and in some quarters highly popular. Not a few of the millionaires have made a liberal and beneficent use of their wealth. One has avowed that it is shameful to die rich, and is largely backing his doctrine by example. The makers of the fortunes, at all events, are workers, and seldom expend in scandalous luxury what they have made by toil and thrift. Worse than the makers are the heirs, who are drones and whose social example and influence too often are scandalously bad. On this continent the millionaire has not even the slight amount of duty attached to land-ownership in England. He has nothing to do but to give himself up to selfish luxury, and in so

doing he is no small source of social danger. That men of independent means and leisure should be made to feel that they must justify their existence by doing something for the state is a necessity, and for the men themselves a most happy necessity, of the social situation.

It can hardly be denied that the feeling and bearing of the rich toward the poor have been growing better of late years; that philanthropic effort of all kinds has been increasing; or that the condition of the laboring class in highly civilized countries has been sensibly improved. But, after all, it must be borne in mind that society is not divided into two classes, one the ward and pensioner of the other. Responsibility for the general state of things is not limited to those who are vaguely called "the rich." The class which lives by manual labor must contribute by prudence and thrift to its own advancement; and this it has not everywhere or always done.

Does socialism threaten a conflict? It presents itself in different forms and aspects, some more and some less likely to breed violence, while the degree of its prevalence and progress in different countries, especially in the United States, is also very uncertain. The name is given to plans of change involving no new principle whatever, such as the ownership of what are called "public utilities" by governments, national or municipal, in which there is nothing new, tho there would be something new in seizing for the State works constructed with the funds of private companies. In Italy the socialism seems to be practically rebellion against the land system, and in Germany rebellion against compulsory service in the army. Nor, again, is there any novelty of principle in co-operation, either distributive or productive. There is something more of novelty, if not of socialism, in the use of the taxing power for the purpose of confiscation to which a certain class of reformers appears prone.

It is, in truth, hard, at least so the writer has found it, to get a perfectly clear notion either of the Socialist's ideal or of his plan for its realization. Is his ideal perfect equality? How does he propose to get rid of the inequalities which diversity of natural endowment has produced, or to prevent them from asserting their power anew and producing the inequalities once more? Without diversity of endowments and free choice of vocations, how is progress to continue? What is the form of government to be? Under a government controlling all the instruments of production and directly or indirectly dictating all vocations, how could liberty exist? What security could there be for the trustworthiness of a government entrusted with such powers? Again, in what way is the change from the present constitution of society to the Socialist's ideal to be effected? Can voluntary surrender on the part of the holders of property and what are now the upper classes be expected? Or is the revolution to be brought about by force? In the latter case, if socialism ever grows strong enough to make the attempt, a conflict unquestionably will impend.

Socialism, in any version of it, must apparently be the death of individual independence. To what extent heterogeneous immigration may have changed American character it might be difficult to say; but great the change must be if the love of independence has lost its power.

TORONTO, CANADA.

The French Woman.

BY ALVAN F. SANBORN.

[Mr. Sanborn has lived so long in Paris that he has become one of the American authorities on French affairs. Our readers will recollect many articles from his pen in our columns.—EDITOR.]

MARCEL PREVOST begins the second book of his novel, "Frédérique," as follows:

"But she [Frédérique] experienced the greatest difficulty in conquering the prejudices of her pupils against the 'French levity'—received as a dogma in England. Her 'French Junior Latinists' thought they were paying her the finest possible compliment when they said: 'Oh, you, Mademoiselle, you are exactly like an English woman. The other French women are not like you! They are not—they don't!—' And, in uttering these words which wounded cruelly a secret corner of the heart of Frédérique, who had grown exceedingly sensitive since she crossed the channel, the young girls of the blonde hair, the pale eyes, the slender, boyish forms, lavished attentions and caresses upon her."

The charm of the French woman has been proverbial for many centuries. It has been celebrated by the travelers of all nations as well as by her compatriots. But it has rarely been recognized by a foreigner without being coupled with an ungallant insinuation (corresponding to the naive reflections of the young English girls above) that she is as frivolous as she is charming; when, as a matter of fact, she is as capable as she is charming, charming because she is capable and, all things considered, the most practical woman in the world.

She was a business woman ages before it became the fashion to talk about the enlargement of woman's sphere. For generations she has engaged in trading of every sort, either in real partnership with her husband or independently—not to test a principle or vindicate a theory, but because this sort of activity comes naturally to her. The widow who used to seem so extraordinary to the English and American members of the artist colony at Barbizon because she ran successfully both a hotel and a blacksmith shop was in no sense an exception, but only a fair sample of the hundreds of thousands of business women in France.

The capacity of the woman cultivators and dairywomen also, from one end of France to the other, is the best possible illustration of the difference between true intelligence and the smattering of book knowledge that nowadays is too often made to pass for it. Thousands upon thousands of the mothers and grandmothers who grew up before the present *régime* of popular education became a vital fact are illiterate in the strict sense of the term, and yet they are as efficient and sagacious a body of women as the world has ever seen. They possess the special knowledge and skill essential to doing well the work they have to do in life. They are buxom, frugal, hard-working and successful in raising and marketing produce, and they have a wholesome, cheerful philosophy withal that speaks wonders for their intellectual and moral poise. The mother of President Loubet, who managed the home farm at Marsanne up to the time of her death at ninety or thereabouts, may have been able to read and write; but if she was able she was an exception to the run of French women farmers, of which she was in most other respects the perfect type.

The French woman almost invariably brings something (in household goods, if not in money) to the common stock at marriage, and she can be counted on doing her share toward adding to this common stock after marriage. She "marries the interests, the hatreds, the friendships" of her husband; "she acquires in a day the experienced subtleties of the man of affairs; she studies the code; she masters the mechanism of credit." In all the classes — peasant, laboring, trading and patrician—she is pretty sure to insist on running the family finances, and she justifies her insistence by her ability to run them as they should be run.

The peasant dares not return home from market with much less than the price of his produce in his pigskin pouch. The workingman does well if he can hold on to a two-franc piece for tobacco

and other personal luxuries when he turns in his pay to his wife on Saturday night. The middle-class husband is allowed by his wife for his private expenses whatever sum she considers proper for a man in his station. Among the noble and the wealthy, likewise, Monsieur is very apt to be put upon an allowance by Madame. Even if the Frenchman would consent to such a thing (which for reasons that may not be gone into here he certainly would not) the French woman would not think of leaving him to his own devices for six months or a year, while she went gadding up and down the earth — for fear she would never be able to restore the family exchequer to its normal state. It is not surprising that under these conditions the Frenchman's card-playing rarely strays beyond anything more desperate than a sober *manille* for petty stakes and that his playing of the races is not highly dangerous as a rule. Even his stock-gambling operations are likely to be relatively innocuous, because he devotes to them only so much of the family surplus as Madame permits.

As compared with the American woman the French woman has no rights to speak of under the law. In money matters, as in most other matters, she owes implicit obedience to her spouse, and yet by her sheer woman's wit and tact she rises superior to statute and contrives to make him obedient in money matters and in most other matters to her.

For preparing a delectable and palatable meal quickly, at small expense, the French woman has no peer on the planet —except the Frenchman who makes cooking his profession. Mistress or servant, she buys in the market with all the shrewdness of an expert. In the kitchen she juggles with herbs and conjures with condiments, and by lightning methods, which seem to be purely instinctive, but which are partly traditional, she builds you dishes such as are to be had in other countries only in millionaire's mansions and the most expensive hotels, if they are to be had at all. "They can dress you out five different dishes from a nettle top, seven from a dock-leaf and twice as many from a frog's haunches," said Oliver Goldsmith of the French in his "Citizen of the World," and this fantastic affirmation, tho obviously intended as raillery, is little if any more marvelous than the literal truth.

Altho the prices of nearly all foodstuffs are as high or higher in France than they are in the United States, the French working-people, thanks to the gastronomic sorcery of their wives, live on an average about twice as well (judged by purely epicurean standards) as our working-people, who earn twice as much.

In furnishing and caring for her house the French woman shows an analogous faculty for producing attractive results with a very little waste of time and at a minimum of cost.

This does not mean that the French woman is in any grade of life a household drudge, with no aspirations beyond her pots, pans, kettles and feather-dusters. It must not be supposed that because she interests herself in housekeeping she interests herself in nothing else. On the contrary, it is by reason of this very expertness in housekeeping that she has the time and energy for other things which the mere household drudge never finds.

She lays quite as much stress on looking well as she does on eating well. Much as she likes a good dinner, she likes even better, if that is possible, good clothes. Her talent for designing and making tasteful clothes is recognized the world over, and for a long time now the French woman's clothes have been accorded that sincerest of all forms of admiration—imitation. What the rest of the world have not been able to imitate, however, is her manner of wearing them. To the latter even so gruff a Francophobe as Bismarck has borne eloquent testimony. "The Parisiennes are not beautiful," he said in 1867, "in the classical sense of the term; but what charm, what grace, they display in the least of their gestures. Of a thing ugly in itself they know how to make something very attractive; so that even in the crinoline, in which you other women have the air of being in a cage, they appear like so many queens engaged in reviewing a whole naval squadron. Where our little bourgeoises and our municipal councillors' wives are perfectly ridiculous they flit about as if they had been born encased in this carapace."

The French woman has performed the miracle of persuading the Frenchman to regard dressmaking seriously and to accord it an honorable place among the plastic arts.

"Our dressmakers," says Paul Adam, "are superior to our portraitists in their plastic sense. . . . A beautiful woman tastefully dressed elevates the popular taste by the imitations she provokes. She accomplishes the social function which devolves commonly on painters, sculptors and architects. A living model, she teaches by her carriage how harmony should be conceived."

The American observers who see in the devotion of the French woman to dress only another proof of her frivolity would be amazed if they knew how much less she spends on clothes, class for class, than the American woman spends. Her marvelous practical intelligence enables her to reconcile elegance with frugality. Indeed, without foreign custom, particularly American custom, most of the high-priced milliners and dressmakers of the Rue de la Paix would be forced to shut up shop. The majority of even the wealthy French women have their dresses made up in their homes, under their own direction, by seamstresses whom they pay a franc an hour, perhaps, besides their meals (in the country, from one to five francs a day), and they have them made over and over to suit the changing modes by these same seamstresses and darned and freshened by their maids when they begin to show signs of soil and wear.

The French woman is saved from many financial follies by the fact that she is not a social climber. Altho socially ambitious—she would not be a woman if she were not — she limits her social ambition to an effort to shine in the circle to which she belongs and thus runs relatively little risk of having her outlay exceed her means. As a matter of fact, extravagance, while held to be venial in a Frenchman, if his wife is weak enough to permit it, is held to be shockingly bad form in the French woman of any class except the demi-mondaine, with whom lavishness is a part of her stock in trade; and even in the case of the demi-mondaine it is atoned for by frugality, more often than not, when she is out of the limelight.

This disposition on the part of the French woman to be content with shining where destiny has placed her is one reason why the women belonging to the different classes are exceedingly civil to each other. For, when you come to think of it, what possible occasion for mutual grumpiness can there be where there is no danger that the workingman's wife will try to impose herself upon the wife of the tradesman or that the wife of the tradesman will try to force herself into the charmed circle of the *noblesse?*

When one speaks in a general way of the French woman, one always means the married woman, since she is the only woman who counts. The *vielle fille* is esteemed a sorry freak of nature—to be pitied if her singleness is due to her plainness or the lack of a wedding portion, to be disparaged if it is her deliberate choice—while the young girl who dominates our society to such an extent as to render it sadly insipid is kept systematically in the background. The prominence given to "Miss Alice" in this country, for example, would be unthinkable in France.

Every normal French girl aspires to marriage as the open sesame to a social career. To her marriage is not an end in itself, but a means to an end. It represents not social effacement, as it too often does with us, but social opportunity. The French woman begins to live, so far as society goes, only at marriage, and it is not unnatural that she should look forward with impatience to an event which signalizes so complete and welcome a transformation.

The French woman neither feels nor affects indifference to or contempt for mere man. How should she when a husband stands to her very much in the light of an emancipator and even of an impresario—as the personage thru whose agency she is enabled to get her talents and her graces before the world?

Neither does she wish or pretend to wish that she were a man, tho it is not uncommon for the Frenchman to wish, half in jest, but also half in earnest, that he were a woman. She knows that it was not Jeanne d'Arc's military genius that made her the national hero, but the fact that she was a woman. Nothing is farther from her thinking than discontent with her sex. She is keenly alive to

the hight, breadth and depth of her womanly opportunities, and would not exchange them for the opportunities of a man. She is satisfied to be the power behind the throne, which she certainly is.

The knowledge, however, that her control over her husband is based on her own personality and not on law makes her very careful not to risk losing it by abusing it. Her economy is never austere, as the proverbial New England economy was in the days when there still was economy in New England. She does not hold the corners of her mouth down, until they grow so, in grim determination to permit no worldly pleasures to herself or to any member of her household. She does not take it as a personal affront either that her husband should have diversions which she cannot share and she does not impose a veto on them. She is not consumed with a dog in the manger desire to deprive him of the good things that it would be out of her power to enjoy if they came to her. So that she holds the purse-strings and can prevent him from squandering their substance in riotous living she does not resent his having his little flings.

In spite of this willingness on her part to let him be a man among men after his own fashion, she is really excluded from less than her English or even than her American sister. Frenchmen would not esteem it a privilege to be left alone at the dinner-table with the "walnuts and wine," and are not obliged to flee from the salon to the smoking room to unbend. The language is more carefully chosen and more delicately shaded in a mixed assemblage than in a male assemblage no doubt, but the content and the intent of the conversation are essentially the same in the one case as in the other. There are literally no forbidden themes in French society.

There are blue-stockings among French women, of course, but the blue peril so much more threatening with us than the much more bruited yellow peril is not even a remote danger in France. No country has produced more or more brilliant women of letters and few have produced more female savants. A constantly increasing number of French girls are pursuing a close approach to what is called in this country "higher education." But the cultured French woman, whether educated according to the old methods or the new, does not hold it her first duty in life to educate all the other persons (and particularly all the other women) with whom she comes in contact. She has too exalted an opinion of the salon as a social force to try to transform it into a school room or a lecture-room and too sure an intuition as to when she is and is not making herself agreeable to play, unconsciously, the part of the bore. However much she may believe in self-improvement, she does not improve herself ostentatiously and does not insist that others shall improve themselves according to her own standards. The terrible talent for meddling which masquerades as altruism in Anglo-Saxon society is conspicuous for its absence in French society. A simple shrug of indifference is the most the French woman ventures to accord to the persons and the things that lie beyond the pale of her own legitimate concern. She does not go to pieces nervously because the world persists in wagging along in its own vulgar and wicked way, as do the so-called "over-mentalized" (but really over-moralized) women of certain countries that we know of.

Even the French new woman, incredible as it may seem, is deficient in the fierce energy for minding other peoples' business which characterizes the new woman in several other parts of the world. She has a keen understanding of the realities of life. She recognizes, none more fully, the physiological and psychological interdependence of the sexes. She does not belittle marriage, therefore, as a rule, or, if she does, she has too great a love of life to make the acidulous vestal her ideal. She knows that if a man sedulously anticipates her wishes and gladly executes her orders, it is because she is a woman and that he would not do either for another man. She would never be satisfied with being treated like another fellow. The bachelor maid can never become an institution in France.

MARLBORO, MASS.

A Soldier of the Kaiser

BY ERNST SCHULTZ

[Mr. Schultz is a young and now fairly prosperous business man in Chicago. He is attached to the memories of the land of his birth, as are most Germans; and he does not see the German army system in a wholly despicable light, as do many of them who have become citizens of the United States. It is because of his balanced judgment that his paper, giving his own experience as a private in that great system, has appeared to be valuable testimony applying to the facts which, in Lieutenant Bilse's recent book, so startled the Empire and aroused so much comment in Europe and America. He is, however, uncompromisingly candid in his exposition of the treatment the German private soldier receives at the hands of his military superiors—a treatment tending to eradicate every vestige of the intelligence so urgently needed by the soldier in modern warfare, and to brutalize or make spiritless all the men on whom it is visited.—EDITOR.]

I WAS one of a family of nine. My father kept a small store, and was compelled to work continually in order to make both ends meet. My poor mother's time was taken up with making and mending our clothes. She was a born tailor. I first breathed the air of my Fatherland at Königsberg. The earliest thing that I can remember is seeing my eldest brother in uniform; or, to be exact, seeing uniform on my brother. I can still recall how the gorgeous braid and bright buttons attracted me. The German boy is brought up with one idea predominating his little life—that of some day being a soldier. The first game we played at, as boys, was little soldiers. How we fought to decide which one of us should be officer! The commission was always gained by the biggest bully.

At six years of age, I was sent to school. From the first lesson to the last, the object aimed at was, not so much to make good citizens out of us, but rather to mold us into obedient and patriotic soldiers. My school days were very much like any other boy's. I had my child sweethearts—and even they would talk about the time when I should be a soldier and wear the uniform. My school days over, I attended the gymnasium, where the teaching was nothing if not military. At fifteen, I was apprenticed, and was getting on nicely, when I was drafted and ordered to hold myself in readiness to be examined for entry into the army. My boyish bravery at once subsided; my love for things military hastily cooled. Two of my friends were drafted at the same time as I was. One day they came to the house, and laid a plan before me. The three of us were to emigrate to America. I was in just the right frame of mind—coward that I was—to fall in with their plans. At this period I was very much in love with a butcher's daughter, who lived on the street next to ours. After pledging her to secrecy, I told her my plans, and asked her for advice in the matter. To my surprise, she berated me soundly, and told me that she would never speak to me again, twitting me with being a craven. She has kept her word to this day. The way my sweetheart treated me angered me, and I was all the more determined to leave Germany. That night at home after supper my father, mother and the children were seated in front of the fire. Two of my brothers were now in the army. My mother was talking about them, when fixing her gaze upon me, she said to my father:

"Isn't it grand, Otto, to think that our boys are all so brave and patriotic. We shall soon have another in the service of the Fatherland."

"Yes," answered my father. "And it will do the boy good and make a man out of him. He sadly needs it."

"I am so glad," my mother continued, "that none of them are cowards. I would rather see them dead than have them running away to America, as the Schumacher and Dietrich boys did. That would break my heart."

I did not say a word—but what a fool I felt! I soon invented an excuse for going upstairs to bed. The next week my two companions went to America—but without me.

I now grew impatient for the time of final enlistment. One day, I found myself at last undergoing the doctors' examination. I was asked to strip; and, after half an hour's thumping on my

chest and sounding of my heart, with various other tests thrown in for effect, the physicians pronounced me sound. I was vaccinated; a uniform was given to me, and there I was, a fully fledged soldier of the Kaiser. If I live to be a hundred I will never forget those few initial weeks. They were simply hell. The first two weeks I was taught how to walk. Here was I, fully grown man—at twenty a lad thinks he knows it all—being instructed in the art of walking properly. I felt like a child; it hurt my pride. For three hours every morning, and for two each afternoon, I had to walk back and forth, a regular moving clothes dummy. If this was the glorious life of a soldier, I already had my fill of it. At times I would rebel mentally, and, in consequence, my walk would become slouchy. I was quickly brought to my senses by the language hurled at me by the officers, which was coarsely forcible and far from complimentary to me. But it made me walk.

My stomach revolted against the food. Ugh! I thought that I would never become accustomed to it. Every four days a loaf of coarse bread called "Comissbrodt" was doled out to us, a loaf six pounds in weight. It was horrible stuff. For the first few days I went hungry. But hard work, coupled with the hunger, very soon breaks a man's spirit and robs him of his nice notions. After a while, I got so that I didn't mind it. For breakfast, I had a hunch of bread without butter, washed down with slop coffee. When dinner time came around, what a welcome I gave it. It consisted of soup, a piece of meat weighing about one-fifth of a pound—not any too much for a workingman—and a mess of potatoes. Supper was an unwelcome repetition of breakfast, with tea occasionally substituted for the coffee. I often wonder how I got through those first few weeks of army life; but there were any number of my comrades—uncouth and awkward farmer lads—even worse off than I was myself, for they were much slower in adapting themselves to the diet as well as the routine.

When I was considered fairly proficient as a walker, I was given a side-arm belt and, with other recruits, drilled in keeping step. When I failed to do so, I was severely disciplined, generally by being rechristened with high sounding—but unprintable—names and, sometimes, by being shoved about. It was not very long before I became a pretty even and regular stepper. Alas, my troubles were only beginning. No sooner had I graduated in marching than I was loaded with a twelve pound rifle. Up and down I was marched, with the rifle resting on my shoulder. In a very short time the part of my shoulder on which the gun rested became sore, bruised and black. I felt like deserting; but pride of youth, coupled with fear of being caught, deterred me. A few days of agony, and my shoulder grew used to its burden. The black spot slowly faded into a brown discoloration; and that, also, gradually disappeared. The next process was the helmet ordeal. How that helmet hurt my head! The wearing of it became almost unendurable. The leather lining gripped my forehead, and the helmet itself pressed so heavily that at times I thought I should get stark, raving mad. But the watchful eye of the officer was continuously focused upon me, and I was more afraid of offending that vigilant taskmaster than of anything else.

Worse was to follow. The cruelties in the German army are graded. They have to be; a man has to be trained up to it. The straightening process was next in line. It was terribly tiresome and frightfully inhuman—at any rate the methods used to teach us were inhuman. I didn't care whether my back broke under the strain or not. Anything would have been a relief. My chin and stomach had to be kept in, my chest out, my arms had to hang loosely at my sides, with the hands held in a certain position. It may sound and look easy; but just try it. The officers treated us roughly if we failed to learn the drill quickly, and none of the men dared register a complaint. To grin and bear it was the only solution of the problem. It breaks a man's spirit, tho. Of course, army regulations forbid an officer to abuse and strike a private; but they do it, nevertheless.

One day I was almost prostrate with fatigue. In spite of all my efforts to the contrary, my chin would occasionally stick itself out in a most unsoldierly manner. An officer noticed it. Without a word of warning, he dealt me a terrible blow on the offending jaw. I saw

stars for a time, but I had to accept my punishment without a murmur. If I had said a word I knew that I would be more severely dealt with. But my chin kept its military position from that time on. They have a rule in the German army that if a private is abused or maltreated by an officer, he is not allowed to report the outrage until the next day. This gives the poor fellow a night's sleep to calm down and to weigh the matter carefully. He can then—if he be so disposed—take his grievance to a superior officer. Woe unto the complainant if he fail in proving his case absolutely! Even if he make it good, he is thenceforth a marked man. Instead of being occasionally the butt of one officer's anger, he now becomes a scapegoat to all of his superiors. So it always happens that, after a night's thinking over the matter, the victim sees the folly of heaping troubles upon his own head, and decides to keep his mouth shut.

I saw several men who failed to keep their chins properly poised subjected to the "board treatment." This consists in placing a board next to the skin under the clothes. The board reaches from the back of the head to the lower part of the spine. It is certainly a very effective, if not a very humane, method of teaching the correct military pose.

At this time I looked forward to the future with dread and loathing, and I became haunted with the idea that I could not stand the life much longer. I now appreciated and understood why there were so many suicides in the German army. I was afraid that I would help to swell the number. If I had at this time learned to use my rifle, or even if I had been able to procure any cartridges, I truly believe that I should have ended my life then and there. The next step in my soldiering was learning how to use a rifle. I was given blank cartridges at first, but, after a while, was allowed to fire ball cartridges. The German authorities are no fools. I had to learn how to hold my right hand in a certain position, and how to use the rifle in German fashion. This time the black spot made itself visible on the front of my shoulder. It was much bigger and sorer than the one contracted previously. The kick of the gun did not help it any, but the hardening process eventually remedied it.

I was now ready for field drill. By this time I had been licked into pretty good shape and fair submission. I had found out that the sooner a man learned his lesson, and the quicker he accomplished his duties, the better for him. At six in the morning we breakfasted, and from that on, until four o'clock in tne afternoon, we were either on the march or run. It was heart-breaking work, but a blessed and welcome relief from the drudgery and monotony of barracks' life. At the end of my first year we had our regimental drill, the maneuvres. Barracks were left far behind. Loaded with knapsack, rifle and sidearms, etc., weighing in all, sixty or seventy pounds, we were marched and drilled. During this period the loaf of bread was reduced to three pounds, half the ordinary size. It was given out every two days instead of every four. We were housed by farmers or by the townspeople at night, and our meals also were provided by them. Even on the march we were compelled to keep ourselves and our uniforms clean and tidy. One night I was so tired out that I fell asleep without brushing my clothes. I was reported to my superior, reprimanded, cursed at, and sentenced to undergo extra drill. My buttons were torn off my coat, in front of my comrades; and I had to sew them on myself. I grew very wretched and morose, and became so fagged out that I marched mechanically, not so much as even thinking for myself. We passed through several villages and towns; but I don't remember very much about them. I was always stupid with sleep when the day's work was over. How they kept us moving! Thank God, there is an end to everything. One morning we were loaded into cars for the return journey, homeward. The cars were mere cattle trucks, but I never enjoyed a railway ride so much in my life as I did that one—and I have ridden on Pullman cars, here in America, since then. When we returned to barracks I was appointed a "Gefreiter." I filled furlough; but the thought of my approaching return to barracks put a damper on my whole holiday. My second year in the army was more or less a

repetition of the first. The work was easier, but I came in closer contact with the officers. Some of them were kind hearted gentlemen; but most of them were cruel brutes. We knew that the officers often got drunk, but we never had the chance of seeing them in that state, for they kept to their own quarters. The caste line between men and officers is very distinctly drawn. I pity the private who is foolhardy enough to cross it. Whenever an officer does something he should not do, the men are kept in ignorance of it. But secrets—however well kept—sometimes become public property. The officers are all powerful autocrats. Their very word is law. There is really no court of appeal. If an officer has it in for a man, he makes that man's life a burden, a veritable hell upon earth. Officers are very wary of public opinion. They do not want any washing of dirty linen in public. One day during drill, a private angered our officer. He was called a filthy name and struck to the ground. Some passing civilians witnessed the outrage, and boldly protested against such brutality. The officer paled to the lips, and ordered the whole company back to the barracks; and the incident closed right there.

During the second maneuvres I was sent on ahead to attend to the selection of quarters for my company. The police supply the names of householders who are expected to shelter the soldiery, and I had to decide on the number of men who should be assigned to each place. It seems that our major dispatched a courier with a message for our captain. For some reason or other the message was not delivered. The next day the captain called me out and, in the presence of the whole company, sternly rebuked me for not delivering the message.

"I did not receive any message," I ventured.

"Shut your mouth, you liar!" he thundered. And, again, he bellowed: "Why didn't you deliver that message, you ———?" I told him a second time that I had not received any message. The captain's temper broke all bounds. With an oath he rode his horse at me full tilt, hurling filthy names at me the while. When he had ridden right up to me—I fully expected he would run me over, but I dared not move—he suddenly reined in his horse and, drawing a long dagger from his belt, shouted, livid with passion: "I have half a mind to stick this thru your vile body, you Schweinhund!"

"Once more he asked me about the message; and once more I answered him.

"Then five days' confinement and bread and water be your punishment, you liar!" he retorted.

He repeated the question several times, and increased my term of imprisonment each time I answered in the negative, until my term of imprisonment totaled fourteen days. He ordered me to be taken away, and I was placed under arrest. The next day I was released. I afterwards found that the captain had discovered his mistake, but he never referred to it.

It often happens that one private will bring the whole company into disgrace, and is the cause of all the men incurring their officers' displeasure. The sinner is taken in hand by the men themselves. The men who occupy the room with him lie in wait for their victim. Should any one of the chastisers be recognized by the victim it would go hard with him, for the laws are always strictly and fully enforced in the case of privates. As soon as the culprit enters the room a coat is dexterously thrown over his head, and he is carried to a stool and laid across it face downwards. He is then beaten with a *Klopfpeitsche,* which is a stick with leather thongs attached, used for beating clothes. The thrashing, while extremely painful, is not capable of causing permanent or serious injury.

I was very much elated when my two years' service drew to a close. Who wouldn't be? The life in the ranks of the German army is no life of ease. The private is virtually a prisoner, and is no better off than a serf. He has no freedom whatever, and is not even allowed to think for himself. He has to be in barracks by nine o'clock in Winter, by ten in Summer. His pay is given to him every ten days, and amounts to the magnificent sum of two marks and twenty pfennigs—about fifty-seven cents in American money. And for this small pittance the private has to suffer all manner of indignities without a murmur; he has to submit to

the grossest insults without a word. In spite of all this, I am proud that I have served in the army of the Kaiser. While the training and ill treatment nearly killed me, it made a man of me. The German army is all right. The abuses in it are what is wrong. Let us hope that time and our Emperor will rectify the evil, before it is too late. I am now an American citizen, and never expect to see the dear Fatherland again. I received a pass allowing me to stay in this country two years. When I took out my papers I of necessity let it expire, and am therefore a deserter in the eyes of the German government. I would dearly love to visit my old home once again; but discretion is the better part of valor, especially in the case of a deserter.

CHICAGO, ILL.

The New San Francisco

BY E. E. SCHMITZ

MAYOR OF THE CITY AND COUNTY OF SAN FRANCISCO.

THE city of San Francisco, on account of the disaster that befell her upon April 18th, 1906, stands before the eyes of the world today more prominently than any other city. Naturally, therefore, there is a great deal of curiosity, as well as sincere interest, as to her present condition and especially as to her future development.

Looking at her condition today she lies wounded and bleeding, injured especially by the destructive force of fire to such an extent that those who are weak-hearted might say that she never could recover from the blow she has received. But as in the days of '49, when the pioneers who came to California attracted by the gold excitement suffered all sorts of privations, yet were determined never to say "fail," but to try and try again, building a small city here, having it wiped away time and time again, only making stronger the determination to rebuild and rebuild better; so the people that are in San Francisco at the present time, instead of being discouraged, are determined that the fire shall not permanently wipe out anything except the differences that had existed between men prior to the 18th of April, and that they are again to rebuild their city upon such large, comprehensive and sane plans as will make impossible a recurrence of the disaster of April 18th, and will make our city not only attractive to those who now live here, but also attractive to those who wish to reside in a city unequaled for its climate, unsurpassed for its beauty and second to none for profitable financial investment.

This is not all talk, because before the burning embers had become cold, buildings—temporary ones, to be sure—were started, and a new set of building laws, compiled by the most able men in their line, was passed by the Board of Supervisors sixty days after the great fire.

We always do large things in California; our men and women are built on a large scale; our fruit is large, our mineral deposits are large; our trees the largest extant, and the fire we had on April 18th the largest that the world has ever known. And so the world is going to see the people of San Francisco arise from their misfortune and build the largest city on this continent.

Altho the fire destroyed the buildings covering an area of four and a half square miles, or approximately twenty-six hundred acres, it left untouched the buildings covering an area of thirty-six square miles — in fact, destroyed buildings covering only one-tenth of the total area of San Francisco.

Already capital is seeking investment in our city to an extraordinary degree, and I have no hesitancy in stating that within the next year there will be more money in circulation in the city of San Francisco than there ever was before. Strange as it may seem, there is not a

business man who has resumed business in San Francisco since April 18th who is not doing more business than he did before the fire; and the conditions here seem so bright for the future of our city that every one is enthusiastic in the thought of its early rebuilding.

her past, looking at her present and attempting to look into her future, I believe that as years go by and we see the city rebuilt with wider streets, more magnificent buildings and special attention paid to the most modern construction, that we shall all say that the fire

E. E. Schmitz.

It seemed as if hell itself had broken loose upon that terrible day in April, and that nothing could stop the total destruction of the city that is loved so well by all San Franciscans and by all those who have resided for any length of time within her gates. And yet, looking at

of April 18th, 1906, with all its destructive force, instead of being a curse, was a blessing to San Francisco. The earthquake and fire have demonstrated that the city must have better fire protection in the way of an adequate water-supply system. Surrounded as we are on three

sides by a magnificent salt-water supply, it is an easy matter to provide pumping stations and to arrange a system of fire protection unequaled by any city in the world. Our present water supply is absolutely inadequate for the present needs of the city, and wofully inadequate for the future San Francisco. We must go to the mountains to secure a pure mountain supply of water, and with that object in view the Board of Supervisors has arranged for investigating many propositions submitted to furnish such a water supply to the city. I have appointed three eminent engineers to act with our City Engineer in making a thoro investigation of the different supplies submitted to the city of San Francisco, with a view of accepting the best one and submitting it to the people of our city at the earliest possible moment to be voted upon. This means that the municipality will be given in a very short time an opportunity of owning its own supply of water, and a supply that will be ample for a city of several millions of inhabitants. All buildings hereafter erected will be of the best construction, with special care given to having them fireproof. Everything possible will be done to attract to our city those who are looking for safe investments.

San Francisco has always been recognized as a city unequaled for its natural advantages. We have a landlocked harbor, upon which could ride the commerce of the world, and in her lap has poured the entire wealth of a State unequaled for its richness. Surely with the natural advantages that San Francisco has, with the precautions that are being taken to insure only first-class construction in her rebuilding, and the great opportunity afforded men of means and men of energy and ability to do business here, she is destined to become not only the metropolis of the West, but to vie in importance and magnitude with the large cities of the world.

One very unfortunate fact to which I call the attention of the entire world is the action taken by the insurance companies in their manner of paying the fire losses. Believing us in a helpless condition, the insurance companies have taken every advantage of our helplessness and with a few exceptions have tried every means possible to avoid full payment of just claims.

The cities of Chicago and Baltimore have had the same experience with fire insurance companies that we have had; but, unfortunately, not enough publicity was given to their methods; and some of the companies that paid sixty cents on the dollar and other companies which failed to pay altogether, were, after the fires of Chicago and Baltimore, able, thru lack of publicity given to their actions, to do a large business in fire insurance in San Francisco, and after the fire to take the same stand and use the same tactics that they had used after the fires of Chicago and Baltimore. But the people of San Francisco are determined that those fire insurance companies which have dealt so unfairly with our afflicted people shall be published to the entire world repeatedly, not so much with a view of injuring the individual companies for the despicable stand they have taken, but in order that the citizens of other cities may have an opportunity of protecting themselves under similar conditions by knowing the companies that are unreliable.

Altho much has been written relative to the destruction by earthquake in this city—statements that to one here were really ludicrous—let it be known that the damage from earthquake in San Francisco was exceedingly slight, and that well-constructed buildings suffered hardly any damage whatsoever. In my own home, for instance, which was finished about two months before the earthquake took place, but one chimney was shaken down, and I did not have a plate or glass broken.

Personally I am enthusiastic in the future development of our beautiful city, and enthusiastic in anything that tends toward that development, possibly for these reasons: I was born in San Francisco, and therefore love her, the city of my birth; my father came to San Francisco in 1850 and helped with other pioneers to lay the foundation of the city that we saw on April 18th. He was a progressive citizen, having built the first brick building in San Francisco; and with that spirit, which has been intensified by inheritance, I am proud and glad to have the opportunity as the Chief

Executive of a brave people to be one of the pioneers in laying the foundation for the future San Francisco.

An effort is being made to have the well-known architect, Mr. D. H. Burnham, come to San Francisco and give his entire attention to laying the foundation for its rebuilding. Long prior to the disaster of April 18th Mr. Burnham had prepared plans for the future development of our city; and now that we have an opportunity to carry out those plans he is the man we are seeking to secure in order that they may be carried out under the direction of the man who prepared them. I mention this to show my readers that nothing is being left undone that will insure the rebuilding of San Francisco speedily and upon the most approved plans.

At the present time we are having a little trouble in labor circles. After the fire, as building material became more scarce the prices began to rise. The two hundred thousand people made homeless naturally flocked to that section of the city where they could secure accommodations, and of course the demand for homes sent the rents soaring skyward. Everything in our city has been temporarily increased in price, and the wage-earners, finding that the necessaries of life were raised in price, found it necessary to ask for an increase in wages. This will continue for only a few months, however, when it must settle down to its former basis.

There has not been, nor do I anticipate, any great disturbance in labor circles, as, after all, the question is simply one of supply and demand and will adjust itself without any detriment to the community. There is plenty of opportunity for skilled labor to find employment in San Francisco, and it will continue to be so for several years to come. Unskilled labor will in a short time become a drug on the market, as that class of labor can be secured at all times. But skilled mechanics, especially those skilled in iron and steel work, will be able to find employment in our city and will be welcomed by all.

The attitude of the labor organizations during the catastrophe was one that called forth the commendation of all. They gave their services freely during the great emergency of April 18th, and since that time have declared that wages would not be increased. This would have remained so had not, as I said before, the price of everything necessary for building, for home purposes, etc., increased remarkably. Contractors, also, on account of the scarcity of men, began to bid against one another, and so, without action being necessary by the unions, the scale of wage increased, in some cases to an unreasonable degree. But the Building Trades Council, composed of between fifteen and twenty thousand skilled mechanics in the building line, decided not to increase its wage scale, and has discountenanced any attempt toward raising at this time the price of labor. The outlook, therefore, for the speedy rebuilding of our city is all that can be desired. We want the assistance of everybody, not only of those within our gates, but also of all citizens in this nation, because the rebuilding of San Francisco means more than merely the restoration of destroyed property; it means the restoring to the nation of her greatest port on her Western shores. It is therefore of national importance that San Francisco should be rebuilt, and as the gateway between the Orient and the Occident should be rebuilt as speedily as possible in the interest of our entire community.

I am sorry to see certain false statements that have been made about the city of San Francisco after April 18th. While the destruction of property was great, aggregating at a conservative figure five hundred million, the loss of life has not, up to the present time, exceeded five hundred. Yet newspapers and periodicals have continued to publish statements that the loss of life ran far into the thousands, and that San Francisco was doomed forever. These statements are not only false and misleading, but can do no good to any one and only harm our city. But even this injustice is rendered without its sting by the thought of the noble and generous action taken by the people of the nation. Up to the present there have been subscribed for the relief of the sufferers seven millions of dollars, and I take this opportunity, in behalf of the stricken people of our city, to express thru THE INDE-

PENDENT to the people of this country the sincere and heartfelt thanks, appreciation and gratitude for their kind, generous and spontaneous assistance in our hour of need.

At the time of this writing, the refugees have been reduced in number to about twenty-five thousand; the relief funds have been placed in the hands of men known in the community for their integrity and for their business ability. Everything is being done that human beings can do for the relief of those who need it. The building of homes is of the first importance; and while the relief committee is taking up that phase of relief work immediately, there is absolute need for the erection of dwellings for families, and there is ample opportunity for men of means to make profitable investment along this line. An impartial investigation as to the conditions in San Francisco will assure any one of its desirableness for residence and manufacturing purposes and for the investment of capital; and while many of our old residents have lost their income by the fire and may never regain their lost wealth, out of all this destruction will spring a new crop of millionaires from the field of men who have courage and energy and faith in the present and future San Francisco.

Our citizens have rallied remarkably since the 18th of April, 1906, demonstrating that true American spirit that exists in all American cities—the spirit which nothing can daunt, the same spirit that has made this nation take its place in the first and foremost rank among the nations of the earth. On all sides there is but one thought, and that is to have a better and more beautiful city than ever before, and with God's help and the sympathy and assistance from the outside world, San Francisco will rise from its ashes chastened by the fire, into a city far greater even than I have here predicted, and far greater than any of us at this time can foresee, standing forth as an example to the whole world of what American courage, pluck and tenacity can and will do under the most trying conditions.

SAN FRANCISCO.

Washington a Representative City

BY HENRY S. CURTIS, Ph.D.

[Dr. Curtis is now Supervisor of Playgrounds of Washington, D. C. For three years he was general director of playgrounds under the Board of Education, New York, and was one of the originators of playgrounds and recreation centers in London. An article by him was published in *Harper's Magazine* in an issue in which an installment of "Lady Rose's Daughter" appeared. Coming to the notice of the author, Mrs. Humphry Ward, she began an agitation along similar lines in England. Dr. Curtis is the founder of the new Playground Association of America.—EDITOR.]

ALL Americans are familiar with the idea of representative men. We are less familiar with the idea of representative cities, but in his last two messages the President has appealed to Congress to make Washington a model city, *i. e.*, a city such that no other municipality would think of building a school, or planning a public building, or laying out a public park, without first consulting this standard. If such a city were once erected by the nation, it would be very economical in the end, because it would give the whole country the benefit of the plans of the most skilled experts in every line and would prevent numberless experiments, wasteful alike of effort, money and human life. It seems peculiarly fitting that the national capital should set a model in ideal social conditions for the training in citizenship and the safeguarding of public morality. To show how the public amusements may be regulated so as not to demoralize, to give the young fundamental interests in right things, to train up the citizens to take a neighborly interest in the common welfare; these are some of the problems the capital should help to solve.

For this Washington, as the capital of

the country and the seat of fashion, occupies a peculiarly advantageous position.

To the tourist who views the legations and the homes of the Senators from the "Seeing Washington Automobile," Washington seems already a model city. Its beautiful asphalted avenues, its shaded streets, its lawns in front of the houses, its numerous small parks, and fine statuary groups, impress him as ideal. He does not see the other side, and nothing suggests to him that behind these beautiful fronts are ofttimes alleys inhabited by hundreds, living in the utmost filth and wretchedness.

Of the 325,000 people of Washington, 100,000 are negroes. Immediately after the Civil War nearly 40,000 of them, looking upon Washington as the home of liberty, took up their residence in the capital city. There was no time nor means to build suitable homes for such a horde, and many of them "squatted" in temporary barracks abandoned by the soldiers, or in flimsy shacks erected for the need of the moment. These were without improvements of any kind, almost unprovided with furniture, damp, insufficiently lighted, and generally unsanitary. Many of them have never been torn down, so there are still about 20,000 people living under very unsanitary conditions.

Most of these people are in the alleys, of which the police census speaks of 286 as "inhabited." Often but a few feet wide, with only one outlet, they ramify into all parts of the block, thus forming a little city, usually of negroes, often surrounded by a wall of fine houses with white residents. The segregation of the alley enables its inhabitants to set new standards of life, and social workers say they can soon notice the decline in moral tone of a family that moves there. The servants connect the alley with the avenue, and disease and crime exact the price of neglect. The negro death rate last year was 27 for 1,000; the white death rate was 16 per 1,000. The indications are that bad housing conditions are largely responsible for this high rate, because the diseases of which the majority die are what are known to the doctors as house diseases, such as consumption, bronchitis, pneumonia, croup, etc. While we cannot say, by any means, that housing conditions are wholly or perhaps principally to blame, the negro appears with about four times as large a proportion of crime to his discredit as the white. There can be no reasonable doubt that the alley conditions are responsible for a considerable proportion of this crime, and for a still larger amount which the alley conceals and which does not find its way into the police court.

There has been a great renewal of interest in housing conditions and the opening of alleys of late.

More adequate supervision of housing conditions is needed. With a large negro population, as yet only partly trained in the ways of civilization, sanitary conditions cannot be left to run themselves. There is, of course, a force of inspectors, but it is quite inadequate to careful supervision; only large enough in general to investigate complaints without looking for nuisances. Congress cuts down the estimate of the Health Department so regularly each year that the force not only cannot be increased, but there is sometimes not enough money toward the end to disinfect houses that have harbored a contagious disease.

The parking along the front of the Washington blocks prevents either coal or merchandise from being delivered there. The rear is reached by an alley which may or may not be inhabited, as it happens. This alley, when it is not inhabited, is usually just wide enough for a wagon to pass through with ease, and is lined on each side with stables, coal houses, privies and other unsightly structures, so that the interior of the block is nearly all taken possession of. Thus, while the Washington block is much more beautiful than the ordinary block on the outside, it is proportionately more ugly on the inside. While it has more exterior spaces that the children may use for play than are found in many cities, it has less interior space for the little children than most.

No city can become a hygienic place for small children until it becomes possible to keep them in the open air a large part of the time, and this cannot be done until a place is provided for them in the

center of every block. This is the only place where they can be safely left to themselves.

Our most stringent building regulations in any city do not take into account more than half of the conditions. The new regulations in New York are a great improvement over previous requirements, and are, perhaps, the best that New York can hope for, but they provide only for light and air, and do not take the children or mothers into account. I should like to see all interior buildings and fences excluded from the center of the block or confined to a narrow margin near the houses, and the remaining space devoted to a communal park and playground. Doctors tell us that our present city conditions will produce degeneration in two or three generations, yet it is becoming more evident every day that the future of the country is the future of the city. We must build a city that does not produce degeneracy, if our civilization is to survive. If there were a good-sized playground for small children in every block, the city would be nearly as good a place as the country for them. With a croquet and tennis ground and a few benches the need of physical exercise and diversion of the inhabitants would be met, and the neighborhood life, which has been lost to the city, would be restored to it.

There is another requirement needed if Washington is to be a model city in appearances. There must be a municipal architect or commission, to which the plans of every building must be submitted.

It is impossible, within the limits of this article, to deal with all or many sides of the situation in Washington, but all will agree that there is one subject which should receive a prominent place in the care of the future citizen. The best example the national Government can set to the country at large is the right care of children. In this regard it has been very remiss. There is at present no child labor law, no compplsory education law, and no juvenile court (tho the bill creating the latter has just been passed). Washington was very late in establishing playgrounds for children.

The older school buildings of Washington are almost without yards, and the average area for all the schools is not over six or seven square feet per child. In Washington the ground can usually be had for one dollar per square foot. When we consider the many new uses for the schoolyard which have developed of late, we see that this deficiency is in itself a serious handicap to a system.

A second great deficiency in the Washington school system is that there are no auditoriums, except in a few of the high schools, and consequently there can be no assembly of the school. When the children are to assemble for an entertainment or other purpose, they have to stand on the stairways and in the halls and corridors. As a natural concomitant of such a building, there is no principal over the school except in name. There is no time nor means of getting the school together as a body and thus creating the school spirit. When we consider that several studies that have been made by Dr. Rice, of the Society for Educational Research, and others seem to show that the principal is the chief factor in determining the efficiency of the school, we see how serious is this lack. But even if we waive the question of school efficiency altogether, there can be no doubt but that the principal is the great social and moral force in the school, and the morning assembly gives a great opportunity for rousing a spirit of loyalty and inculcating ideals. A sympathetic principal of the right kind is certainly one of the greatest moral forces in the community.

On account of the lack of an assembly room there can be no exhibitions nor entertainments which the parents are invited to attend, thus bringing the school and community together. There is a lecture system, but no place to give the lectures. Most of the rooms are not lighted, and therefore cannot be used for meetings at night.

On the whole, however, the greatest need of the system seems to me greater pay for the teachers. The salaries are so small that there are practically no men in the elementary grades. It is impossible to keep them or the more efficient women, except where home ties bind them, and there is a constant draining off of the best to other cities. During the last three years forty men have left the system. Their salaries here have averaged a little more than $1,000. They went to

positions averaging a little more than $2,000. The high school teachers are poorer paid than the teachers in any other large city in America. The elementary teachers also are near the bottom of the list. Washington is one of the most expensive cities to live in in America, so that, when we count the purchasing power of the money, they are probably as poorly paid as the teachers in any city system. The kindergartners begin at $35 a month. The supervising principals, who correspond to the district superintendents in other cities, get the magnificent salaries of $2,000 per annum.

Washington, with its large colored population, is in peculiar need of trade schools. The nation ought to set a progressive example to the country at large, and especially to the South, in this particular. Not only have no such schools been established, but the two vacation schools giving industrial work, which were started several years ago by private funds, and are much needed, had to be dropped for the lack of an appropriation of $2,000 to carry them on.

I will not lay these criticisms of the school system at the door of the school authorities, who seem to me capable and earnest men and women. It has been impossible to secure a sufficient appropriation to carry on a progressive system.

For example, the commissioners this year have asked for $15,000 in order to maintain the existing playgrounds and for $65,000 in order to purchase a site and erect a playground building. This building is to contain on the ground floor shower-baths, a play room and toilets, on the first floor a reading room and library, a small auditorium and social hall, and a few club rooms. The top floor to be devoted entirely to a gymnasium. Each of these features is needed by the playground, and each is needed by the community as well, inasmuch as there are at present no public baths, no auditoriums in the schools, no public places for neighborhood gatherings, and no municipal or common school gymnasiums. Thus far $15,000 for maintenance of nineteen playgrounds has been cut to $10,000, and the appropriation for the building has been eliminated altogether in the House Committee.

Yet there is no reason to be discouraged. The President's call has been heard by millions and pondered by many, and a lively interest is being manifested. Mr. James B. Reynolds is studying conditions here at the request of the President, in order that he may advise him as to the elimination of the worse evils. Meanwhile Mr. Charles F. Weller, General Secretary of the Associated Charities, and a number of his able and devoted coadjutors have already got most of the movements under way. The commissioners are tireless in their efforts to improve conditions, and a truly remarkable progress has been made in the last few years. Last year saw the installation of a filtration plant to clarify water that up to that time had been a national disgrace and given Washington the highest death rate from typhoid fever in the country. This year will see the completion of a sewage disposal plant and a new District building, which will rank among the best of their kind in the country. This year or next will also, in all probability, see the completion and laying out of Potomac Park, which has been made by excavating a deep water channel thru the marshes in front of Washington and piling up the excavated material into a high and beautiful island across this channel. It will probably see a beginning of the improvement of the Anacosta Flats in the same way.

This is a series of public improvements accomplished in five years of which any city might well be proud. The pity is that they were so long delayed, and the result is that there is much yet to do. If the country at large will manifest an interest in having the best for Washington, Congress will, I believe, be only too glad to grant the appropriations that will make it possible.

WASHINGTON, D. C.

A Plea for "Vers de Societe."

BY LA TOUCHE HANCOCK.

A POET is born, not made. A writer of *vers de société* is bred. The phrase, *vers de société,* as literally translated, is misleading. There is no precise English equivalent. Society implies artificial life as opposed to natural life. *Vers de société* must be written by a poet, who is educated by the influence of society to produce it. He is not confined, by any means, to the topics of artificial life. Any subject of an exalted or trivial character may suggest a theme, but it must have, first and last, the elements of refinement. Such a poet must dwell and mix with the world. He must share the tastes he mirrors. He need not be exempt from the weaknesses he ridicules, but it is imperative that he be a man of the world, cultured and able to move in any circle of society. He should be an egotist; that is, his individuality should be pre-eminent, and he should not so much seek the Muse as let the Muse come to him.

Vers de société is extremely easy to write badly, and very difficult to write well. The creation may be a matter of hours, but the polish is the labor of days. Truth to tell, there are few minds playful enough to write light verse of this kind. The patience necessary for such a thoro execution as is needed is very rare. The labor is quite misproportioned to the lightness of the load and the seriousness of the result. This is probably the reason why hardly one recognized poet in this country tries to write *vers de société.* One may well ask, Where are your Praeds, your Calverleys, your Lockyers, your Dobsons, your Holmeses, your Pennells, your Leigh Hunts, your Carrolls, your Leighs, not to speak of a score of earlier writers in a similar vein? Honestly speaking, in the United States today there is not one native poet who is worthy to be classed as a writer of respectable *vers de société.*

In England, despite the ill-timed jeers and jibes at the British comic papers, the one man who has the right to be enrolled among the names mentioned is Owen Seaman, the editor of London *Punch.* His *vers de société* is quoted from one end of the United States to the other. In our own land we look in vain for those triplets, rondels and rondeaus, with their characteristic "gay wisdom." The playful tendencies of rhyme seem to be swallowed up by the terrible seriousness of money-making!

But what is *vers de société?* It may be said to rank next to the epical and lyrical art of an age, and will sometimes even excel it in its interpretative power. It is an expression of common sentiment and feeling in graceful and familiar rhyme. It excites no wonder, and apparently pleases without an effort. It is a dilettante conception. It is friendly persiflage; or, to put it into more colloquial language, it is "poking fun." It may be half melancholy, but even then should not excite more tears than a pocket handkerchief can absorb. If a bit of the serious side of life peeps out, it should be hidden as quickly as possible, with a laugh at the exposure. It is a play at bo-peep with the feelings.

In fine, *vers de société* is in a class by itself—a light, humorous talk, consisting of banter, of jets of wit and satire. It is a summer lightning produced by the collision of electrical natures. It is made up of studiés, minute but delicate, drawn from every rank of society, and appealing to different tastes. It stands in the same relation to audiences in the salon as rag-time to admirers in the saloon. It is characteristic of gentle manners, without the seduction of cheap smartness and the ostentation of shabby gentility, which, as Lord Byron says somewhat emphatically, is "far worse than downright blackguardism!"

Further than this, it should have a veil over it dense enough to avert any risk of being styled preachy. It should have the sparkle and fizz of champagne, and never be flat. There is a constant danger of the poet falling into trivialities, but the smallest blemish takes off the whole value, like a flaw in a jewel. As finely wrought as a filagree, and as polished as a cameo, it should have under control wit, humor, irony (especially irony), satire, sentiment and sensibility. The writer of *vers de société* must not only possess all these qualifications, but also have the skill to use them in proportion and subordination to elegance. Brevity, buoyancy, frequent crisp and sparkling rhyme and delicious piquancy, are all necessary attributes. With these qualifications granted, you have *vers de société.*

It may well be asked, is it at all wonderful that poets of this sort are few and far between? Not wonderful, but regrettable. The specimens of verse published in the newspapers and magazines are anything but *vers de société.* The modern minor poet in the magazine strives to be as unintelligible as possible. He succeeds, apparently, in mystifying his editor, and certainly the public. The ephemeral bard, who is lucky enough to occupy a corner in the daily or Sunday newspaper, has but one object in view. He has an idea, which he wishes to spring on his readers at the end of his effort, and he gets to that idea as fast as he can, rushing, leaping and steeplechasing, and as often as not he lands safely with a "hoop-la!" a "gee-wizz!" or a "wow!" Variation in metre is pooh-poohed, rimes are distinguishable by their infrequency, but — oh! ruinous phrase to art!—he "gets there just the same" and collects his few dollars at the end of the week. So far so bad, but it is deplorable to think that now and then from the balderdash a carefully polished verse stands out, which gives evidence of a right vein, and of a promise that will never be fulfilled, simply because, in the mad rush and hurry to be in advance of his neighbor, care and studied skill are thrown aside, and a latent talent is prostituted to an evident carelessness and negligence!

This is so much the more deplorable as there is absolutely no necessity for this rabid haste. Now and then, of course, a brilliant idea flashes on the brain and is instantly put in black and white. The inspiration may be carried out satisfactorily in a few minutes, but such things happen but occasionally.

Comparisons have a bad name, and in this case would be disastrous, but it is only necessary to recall any effort of Oliver Wendell Holmes, Locker, Calverley, Dobson, *et hoc genus omne,* to acknowledge the scathing truth that our minor poets are sadly deficient in nearly every attribute of *vers de société.* Do they curb fancy by truth, or speculation by sense? Are they capable of teaching any moral lesson in a light way? Is there one of them who would or could attempt to attain the perfection of society verse as is shown in the following examples:

"I recollect a nurse, called Ann,
Who carried me about the grass,
And one fine day a fine young man
Came up and kissed the pretty lass!
She did not make the least objection.
Said I, 'Aha!
When I get old, I'll tell mama!'
And that's my earliest recollection!"

To what can we compare for frankness, insouciance, airiness and ease this extract from one of Calverley's delicious flights?

"Love me, ah! or love me
Not, but be my bride!
Do not simply shove me
(So to speak) aside!
P'rhaps it would be dearly
Purchased at the price,
But a hundred yearly
Would be very nice!"

Then again, for a delicate touch of wit and playful tendency, can anything match these lines from "From a Nice Correspondent," by Frederick Locker:

"Today in my ride I've been crowning
The beacon; its magic still lures,
For there you discoursed about Browning,
That stupid old Browning of yours!
His vogue and his verve are alarming,
I'm anxious to give him his due,
But, Fred, he's not nearly so charming
A poet as you!"

On the common subjects of the day the persifleur is at his best. He will transform a nettle into a budding flower, and make you think there is inspiration in an ordinary brick. How often has, for instance, "tobacco" been rhymed to, and yet it remains for a master of *vers de société* to bring the whiff of the cigar to your nostrils, the tobacco smoke to your gratified senses. Listen:

"Sweet, when the morn is gray,
Sweet, when they've cleared away
Lunch; at the close of day
Possibly sweetest!"

Then, plunging into light caricature, he continues:

"Jones (who, I'm glad to say,
Asked leave of Mrs. J.)
Daily absorbs a clay
After his labors."

In their light play of fancy, as distinguished from imagination, these poets are noted for their distinction of rhyme. Even where this is not the case, the rhymes have a freshness about them which excuses their habitual use. In the following every rhyme is hackneyed, but not one that has not its evident excuse. As a lesson to those who vitiate the poetry of the present day it is useful and appropriate:

"Oh! if billows and pillows, and hours and flowers,
And all the brave rhymes of an elder day
Could be furl'd together this genial weather,
And carted or carried on "wafts" away,
Nor ever again trotted out, ah, me!
How much fewer volumes of verse there'd be!"

It is of little use to multiply quotations. The minor poets, who could give us dainty verses, don't or won't read what their masters wrote. There is evidence in their writing of a five-dollar bill hanging before their eyes and a rhyming dictionary lying at their side!

Lastly, it may be asked of what use is *vers de société? Cui bono?* Pasing over the sage formality and disheartening monitory dullness which some saturnine moralists are ever opposing to mirth and recreation, it may be said that all relaxation has its use. Even such light essays as these are a service to literature. Their study teaches versification and the use of words. They discipline the "sucking poet." He must subject himself to the powers and dictates of decency and human kindliness. Isaac D'Israeli says that the possession of genius is not always sufficient to impart that grace of amenity so essentially characteristic of verse consecrated to the amusement of society. That must be bred in the poet. It isn't born or made.

Vers de société should and does give a varied and vivid picture of cotemporary life and manners. It shows the sympathy between class and class, and at times exposes the standards of morality. It blends the sympathy of fellow hearts, and wreathes a gay and sweet nosegay from the soothing plant of humor. It must be clever to gain an audience. When the audience is once attracted, and the task is pronounced satisfactory, the author may well congratulate himself that not only is he acknowledged as a writer of *vers de société*, but also necessarily as a decent member of society!

STATEN ISLAND.

Medical Aspects of Ibsen

BY JAMES J. WALSH, M. D., Ph.D.

ASSISTANT EDITOR OF "THE MEDICAL NEWS."

ANY physician who has attended a series of performances of Ibsen plays can scarcely help but be struck by the fact that most of his popular dramas are concerned with distinctly medical questions. There is scarcely one of them which does not contain a wonderfully accurate study of some pathological condition. This is so manifest that after a time the physician, especially if he is interested in mental diseases, cannot help but find a renewed attraction to Ibsen's work because of the display of his wonderfully acute observation with regard to those affections. The medical attendant at the

theater is almost sure to suspect that Ibsen must have deliberately chosen those phases of mental disturbances for dramatization because of the wonderful lessons with the regard to the impairment of moral responsibility which they involve. Men's judgment of human actions would be much modified if they knew all the factors at work in an individual case, and it is this apparently that Ibsen has tried to point out and succeeded with a completeness that no other dramatist has ever even attempted.

It may seem far-fetched to attribute to Ibsen the deliberative motive of wishing to instruct the public in this important matter, but if it is remembered that before becoming a literary man he had been a medical student and was very much interested in mental diseases, the surprise will vanish. Certain it is the plays of the Norwegian dramatist which have in these last few years attracted so much attention in New York are all of them founded on distinct types of mental affection that are well known and readily recognized, even by those who do not claim any very special expertness in the diagnosis of such cases. "Ghosts," which was given last year, is evidently a deliberate study in that very serious disease of modern civilization—paresis. Mrs. Alving's son is manifestly in the initial stage of that disease, the predisposition to which was acquired from his father, who clearly died from the effects of it. Ibsen, with true nosological completeness, however, points out that there were opportunities for the acquisition of the affection in certain irregularities of the young man's life in Paris, and that indeed mainly because of this his physician had warned him of its approach. The symptomatic picture is complete, even to the attacks of epileptiform character, which so often mark the early stage of the disease. The delusions, the sensual excesses, the change of disposition—in a word, the course of the disease, are well marked in Ibsen's wonderful delineation. Perhaps no more striking study of paresis has ever been written.

Now paresis is an affection to which the modern physician would, above all, like to call attention. Something more than one-seventh of all those who die in our insane asylums are its victims. It is especially young adults, men under thirty-five, who are carried off by it. Its incidence has greatly increased in modern times, owing to some extent at least to the over-strenuousness of life in our large cities, but more than all else to the opportunities for the spread of certain social diseases afforded by the overcrowding of population. Ibsen, in calling attention so poignantly to it, was performing a great work of social philanthropy. It cannot but be that he realized exactly what he was doing when he took this for his theme.

"Hedda Gabler," which has attracted even more attention than "Ghosts," exploits another type of mental disease quite as readily recognizable as that treated in "Ghosts" and with a lesson that should be at least as effective. Poor Hedda is a typical example of what is known in psychiatry as a puerperal psychosis. Under the domestic circumstances in which she is placed, some women of strong mental peculiarities may have their queerness of disposition so emphasized as to make them very troublesome members of the household and at times, unfortunately, even dangerous for themselves or for others. The ordinary healthy woman, with a good heredity, does not run any such risk, and indeed the disposition is apt to be gentler and even more affectionate at such times than under ordinary conditions. Hedda was one of the unstable and suffered accordingly. It seems a pity to exhibit this form of psychosis with such absolute fidelity upon the stage as does Ibsen, but there can be no doubt of the truth of the picture that he has drawn so dramatically, nor of the awful possibilities that he has pointed out.

It is a question, of course, how far in any department of esthetics the representation of what properly belongs to the domain of pathology for the sake of the morbid interest it will arouse is justified. The attraction and even the beauty of the pathological in its own sphere cannot be denied. I shall never forget seeing Virchow one day trace to its origin an especially malignant cancer whose primary location had puzzled all his assistants. As he revealed all its

awful course he said: *"Wie Schön!"*—"How beautiful!" But this is scarcely the beauty that appeals to the esthetic sense. Something of the same feeling seems inevitable in contemplating Ibsen's wonderful ability to lay bare the innermost secrets of mental degeneration. When, however, the dramatist is able to create so completely as he has the degenerate character and to show its inevitable tendencies, then the picture, tho humanly sad with a supreme poignancy, may be as artistic and as justified in itself as Shakespeare's work in the creation of Ophelia. And who shall say that Shakespeare's delineation of Ophelia's madness is not as great as his creation of Iago's awful malignity?

In the last of Ibsen's plays that was revived in New York, "When We Dead Awake," we have once more a distinct type of mental disease, or rather we should say two types, of the same disease presented in a contrast that brings out the lights and shades of each. Ibsen spoke of this last work of his as "the dramatic epilog" of his career. It may therefore well be taken to emphasize and illuminate the dramatic motives of his previous plays. In this play the dramatist is frank enough to present his principal woman character as still under the constant surveillance of an attendant because of her manifestations of severe symptoms of outspoken mental disease in the recent past. Irene is indeed a melancholic paranoiac of a type not at all unfamiliar, tho in the development of the disease there may be many features which seem to indicate rather a sublimated state of mental uniqueness than true mental degeneration. Almost needless to say, such a character gives opportunities for great dramatic possibilities. This form of perverted mentality, however, constitutes one of the most serious dangers in modern life, and Ibsen's selection of it for the epilog of his dramatic career would seem to emphasize the definite purpose of attracting attention to this all-important subject of mental peculiarities.

Irene, as the result of posing in "the altogether," for Rubek's masterpiece of sculpture, "The Resurrection," feels that she has lost her soul, that she has become as those who have died. In the older time, when life was less psychologically introspective and when religious motives stood for more, the loss of the soul was a characteristic expression of the melancholic paranoiac, who felt that the irretrievable had been committed. Overmastered by this idea Irene loses her mental control and must be placed in charge of an attendant. Long she wanders looking for the sculptor, with the idea that she shall be revenged by his death for her loss of life. When she meets him, however, her purpose fails, mainly because she finds that Rubek himself is suffering with something of the same illusion of irreparable loss that has worked such havoc in her life.

It is in this combination of two paranoiacs that Ibsen shows the acuteness of his genius as an observer of mental peculiarities. Nothing is more striking in the experience of the alienist than to find that persons suffering from corresponding mental diseases have a curious attraction for one another. Hence the number of cases in which husband and wife, tho coming from very different family strains, are found as the result of stress of emotion due to family difficulties to suffer from very similar mental symptoms. Hence, too, that peculiar tendency to what is known as psychic contagion by which the illusions of one paranoiac become truths for other mental degenerates who are brought much in contact with them. It is not so surprising then to find that Rubek has suffered the loss of something that he cannot replace in life. Like calls to like, and there is a reunion of these mentally stricken, eminently dramatic and that results, as might be expected, in a fatal issue.

Viewed from this standpoint, the works of the great Norwegian dramatist, who is able to present in a few dramatic situations mental peculiarities that are so elusive as to require long paragraphs of description in the textbooks, does not lose, but rather gains in forcefulness. No one since Shakespeare has succeeded in painting so truthfully to life various types of mental peculiarities. There are strokes of genius in the rapidity with which each picture is sketched, and the unobtrusiveness of

even the most pathological aspects of the character is so marked that the plays do not disgust nor deter, but, on the contrary, attract the public whom they are meant to instruct. The three plays mentioned, far from being exceptions to Ibsen's usual work, are rather characteristic types of it. Of all his later dramas there is not a single one that does not contain some striking example of a mind "jangled out of tune." It is of the essence of his genius that these abnormal characters are eminently true to those most frequently seen in the life around us.

NEW YORK CITY.

Defects in the Constitution of the United States

BY WALTER CLARK, LL.D.

[The Hon. Walter Clark, Chief Justice of the Supreme Court of North Carolina, author of many volumes of history and law, is among the most careful and earnest students of constitutional law, and created a wide interest among lawyers thru his lectures upon the Constitution of the United States, before the Department of Law of the University of Pennsylvania. In the following article he has embodied many of the thoughts which he thus advanced.—EDITOR.]

AS a product of its time, the Constitution of the United States was and is without counterpart. Gladstone gave words their way in praising it. Too much has not and cannot be said of the wisdom of the fathers who framed it. But idolatry is dangerous. Blind faith ought not to be a part of our national characteristics, and when from the cradle up—even from the halls of Congress—we hear that the "Great Instrument" stands beside the Bible, inviolate, that the Constitution of the United States is for this Nation, today, all that the anxious fathers wished that it might be one hundred and twenty years ago, we are being brought too far. It is giving the framers of the instrument credit for being inspired prophets of greater wisdom for the future than they possessed for their own day and generation.

They were not satisfied with the Constitution when it left their hands, as properly meeting the demands which immediately faced them. Neither were they satisfied with the Constitution itself. In short it was a compromise between many contending factions. It was simply the best that could be obtained at the time under the widely separated conditions and expectations of the detached elements working up in the struggling States. There were grave defects in the Constitution then, there are graver defects today, calling for careful revision.

There was a great difference between the two Conventions. That which met in 1776 was frankly Democratic. Success in its great and perilous undertaking was possible only with the support of the people; it must be with the people. The Great Declaration was an appeal to the masses. It declared that all men were "created equal and endowed with certain inalienable rights, among them life, liberty and the pursuit of happiness, to secure which rights governments are instituted, deriving their just powers from the consent of the governed; and that when a government becomes destructive of these ends, it is the right of the people to alter or abolish it, and institute a new government in such form as shall seem most likely to effect their safety and happiness."

Never was the right of revolution more clearly asserted or that government existed for the sole benefit of the people who were declared to be equal and endowed with the right to change their government at will when it did not subserve their welfare or obey their wishes. Not a word was there about property. Everything was about the people. The

man was more than the dollar then, and the Convention was in earnest. Every member signed the Declaration, which was unanimously voted; according to Dr. Franklin's pertinent remark that it behooved them "to hang together or they would hang separately."

The Convention which met in 1787 was as reactionary as the other had been revolutionary and democratic. It had its beginning in commercial negotiations between the States, when they were weary with a long war, and when the fierce enthusiasm for liberty was somewhat relaxed by the pressing need to earn the comforts and necessities of life, and when oppressed by the ban upon prosperity caused by the uncertainties and impotence of the existing government were thoroly exhausted. Under these conditions and with as many minds as there were men, the Convention of 1787 came together.

Ignoring the vital maxim that government should exist only by the consent of the governed, it sat behind closed doors that no breath of popular will should affect its decisions. To free the members from any future responsibility, all were prohibited from making copies of any kind of the resolutions or to correspond with constituents or others about matters pending before the Convention. Any record of yeas and nays, even, was forbidden; but one copy was kept without the knowledge of the Convention. It was kept by the one member best able to grasp each situation and make fair note of it. The journal was kept secret at the time and later a vote to destroy it fortunately failed. Mr. Madison's copy was finally published after the lapse of forty-nine years, when every member had passed beyond human accountability. Only twelve States were ever represented. One of these withdrew before the final result was reached. Of the sixty-five members, only fifty-five ever attended, and so far from being unanimous only thirty-nine signed the Constitution, and some of them actively opposed its ratification by their own States, later.

That the Constitution thus framed was reactionary was a matter of course. There was grave consideration, at the time, of a royal government with Frederick, Duke of York, second son of George III, as king. Alexander Hamilton, whose wonderful work as Secretary of the Treasury, crowned him with a halo and whose tragic death obliterated the memory of his faults, declared himself in favor of the English form of government, which he denominated a "most notable institution." Failing in that he advocated an executive elected by Congress for life, Senators and Judges for life, and Governors for States to be appointed by the President. Of these he secured, as it has proved, one most important item, from his standpoint, the creation of the Judges for life. The convention was aware that a constitution on Hamilton's lines could not secure ratification by the several States. But the constitution adopted was as undemocratic as possible and was very far from responding to the conditions laid down in the Declaration of 1776, that all governments derived their just powers from the consent of the governed. In his speech to the Convention, Hamilton stated that the members were agreed that "we need to be rescued from the Democracy." They were rescued. Thomas Jefferson, unfortunately, was absent as our Minister to France and took no part in the Convention, tho we owe to him very largely the compromise by which the first ten amendments were agreed to, in exchange for ratification by several States which otherwise would have been withheld.

The consent of the governed was not to be asked. In the new government the will of the people was not to control and little to be consulted. Of the three great departments of Government—legislative, executive and judiciary—the people were entrusted with the election of only the House of Representatives—one-sixth of the government at most, even if the House had been endowed with equal authority and power with the Senate. The Declaration of 1776 was concerned with the rights of man. The Convention of 1787 entirely ignored them. The guarantees of the great rights of freedom of speech and press, freedom of religion, liberty to assemble, right of petition, exemption from general warrants, the right of trial by jury and by grand jury, protection of the law of the land, and protection from seizure of private property for other than public use, and then only upon just compensation—matters of the

utmost importance to the rights of the people were entirely omitted. They were added in the first ten amendments by preliminary agreement, while the Constitution was still in controversy in the several States, only because it was necessary to give assurance that such amendments would be adopted in order to secure the ratification at all.

The Constitution was so far from being satisfactory, even in the circumstances of the time for which it was framed, that only eleven States voted for its adoption in the Convention. Its ratification by the conventions in the several States was carried with the greatest difficulty, and in no separate State was it ever submitted to a vote of the people themselves. Massachusetts only ratified after a close vote and a demand for amendments. South Carolina and New Hampshire demanded amendments, as did Virginia and New York, both of which agreed to ratification by the narrowest of votes, reserving for themselves still the right to withdraw, and two States rejected the Constitution and subsequently ratified only after Washington had been elected and inaugurated—matters in which they had no share.

George Washington was President of the Convention, but as such was debarred from sharing in its debates. He left no impress upon the instrument so far as is known. Yet it was freely admitted that but for his popularity and influence the Constitution would have failed of ratification by the several States, especially Virginia. Indeed, but for his influence the Convention would have adjourned without putting its final hand to the Constitution at all—it came very near doing so. Even his great influence would not have availed but for the overwhelming necessity for some form of government, with imperative haste, as a substitute for the rickety "Articles of Confederation," which were utterly inefficient.

An instrument so framed, adopted with such difficulty and ratified after such efforts, and by such narrow margins, could not have been a fair and full expression of the consent of the governed. The men that made it did not deem it perfect. Its friends agreed to sundry amendments which were adopted by the First Congress, as a preliminary necessity. The assumption by the new Supreme Court of a power not contemplated by the framers caused the enactment of the Eleventh Amendment. The unfortunate method prescribed for the election of the President, which nearly caused a Civil War in 1801, forced the adoption of the Twelfth Amendment, and three others were brought about as the result of the great Civil War. The Convention of 1787 recognized, itself, that defects innate in the Constitution and developed by experience and the lapse of time would require amendments and the instrument prescribed two different methods by which amendments could be made.

Our Federal Constitution was adopted 120 years ago. In that time every State has radically revised its own Constitution —most of them several times. The Constitution of New York requires that the question of a Constitutional Convention shall be submitted to its people at least once every twenty years, in order that organic law shall keep abreast of the needs and wants of the people and represent the will and progress of today, instead of being hampered by provisions deemed best by the divided counsels of a handful of men in providing for the wants of the government of over a century ago.

When the Constitution was adopted in 1787 it was intended for three million people, scattered along the coast from Massachusetts to Southern Georgia. Now we are trying to make it do duty for one hundred million from Maine to Manila, from Panama to Porto Rico and the Pole. Then the population was rural. At the census of 1790 we had but five towns in the whole Union which had 6,500 inhabitants each and only two others had over 4,000. Now we have the second largest city on the globe, with over four million inhabitants, and many that have passed the half-million mark. In 1790 we had 75 post offices, with $37,000 annual post office expenditures. Now we have 75,000 post offices, 35,000 rural delivery routes, and a post office appropriation of nearly $200,000,000. During the first ten years the total expenditures of the Federal Government, including the payment of revolutionary debts, including pensions, averaged $10,-

000,000 annually. Our expenditures now are more than seventy-five times as much. When the Constitution was adopted Virginia was easily the first State in influence, population and wealth, having one-fourth population of the entire Union. New York, which then stood fifth, now has double the population of the whole country at that time, and several other States have a population greater than the original Union—States whose very names were then unheard of. Steamboats, railroads, gas, electricity—except as a toy in Franklin's hands—coal mines, petroleum and a thousand other things which are a part of our very lives today, were undiscovered. Corporations, which now control the country and its government, were then so few that not till four years later, in 1791, was the first bank incorporated; the charter for the second bank was only obtained by the subtlety of Aaron Burr, who concealed the banking privileges in an act incorporating a water company. Corporations have had an affinity for water ever since.

Time has revealed flaws in that original instrument as well as developed new necessities. The glaring defect in the Constitution was that it was not Democratic. The only voice of the people was in the election of one-sixth of the government, one-half—by far the weaker half—of the Legislative Department. The other half, the Senate, was made elective at second hand, by the State Legislature. The President was to be elected at third hand. In fact until after the memorable contest between Adams, Clay, Crawford and Jackson, in 1824, in the majority of the States, the Presidential electors were chosen by the State Legislatures. They were so chosen by South Carolina until after the Civil War, and in Colorado in 1876. The intention was that the electors should make independent choice, but public opinion forced the transfer of the choice of electors from the Legislatures to the ballot box, and then made of them the figure heads which they are, thus capturing the Executive Department, and that department, with the House of Representatives, mark today the extent of the share of the people in this government.

The judiciary were placed a step further removed. The judges were to be selected at fourth hand, by the President—who was intended to be selected at third hand—and subjected to confirmation by the Senate chosen at second hand. And to make the judiciary absolutely impervious to any consideration of the "consent of the governed" they were appointed for life.

A constitution so devised was not intended to express but to suppress or at least disregard the wish and consent of the governed. It was admirably adapted for what has come to pass—the domination of the government by "The Interests." Should the President favor legislation and the House of Representatives pass a bill, the Senate can defeat it; and if by chance it yield to the popular will and pass the bill, as was the case with the "Income Tax," there remains the judiciary, who have assumed, without any warrant expressed or implied in the Constitution, the power to declare an act of Congress unconstitutional at their own will and without responsibility to any one.

The people's part in the government, in the choice of a House of Representatives, even when reënforced by the Executive, is still nullity in the face of the Senate and Judiciary in whose selection the people have no direct voice.

The Government of the United States is a government by Senate and Judges—by whatever power can control the selection of senators and judges. What is that power? We know that it is not the American people.

Let us not be deceived by forms. Government rests not upon forms, but upon a true reply to the question, "Where does the governing power rest?"

In England today, there is a monarchy in form, but the real government of England is vested in a single House of Parliament elected by the people. The executive is not the king, but the Prime Minister and his Cabinet, practically elected by the House of Commons, and holding office at the will of the majority in that house. The king has not even the veto power except nominally, since it has not been exercised in a single instance for more than two hundred years; and the sole function of the House of Lords—a club of rich men representing great vested interests—is in the exercise of a suspensive veto—exercised only till the

Commons make up their mind that the bill shall pass, when the House of Lords always gives way as the condition upon which their continued existence rests.

In this country we retain the form of a republic, we choose our President and House of Representatives, but the real power does not reside in them or in the people. It rests with those great "interests" which select the majority of the Senate and the judges.

The sole remedy for this is by amendment of the Constitution that shall make it democratic; in other words, counteract the effects of the reactionary influence following the strenuous patriotism of the Declaration, which was so strong during the framing of the Constitution.

In the Convention of 1787, Pennsylvania voted for the election of Senators by the people. A strong argument used against this was that the farming interests, being the largest, would control the House and that the Senate could only be given to the commercial interests by making its members elected by the Legislatures—which proved prophetic—tho the deciding influence was the fear of the small States that, if the Senate was elected by the people, its membership would be based on population. The same argument would still resist the call for a reviewing convention today, and be aided by "the interests," with the press which they control; but in truth and justice it may be that some modification now in that respect would be efficacious. There may no longer be good reason why Delaware, Nevada, Rhode Island, should have as many Senators as New York, Pennsylvania or Illinois. It might better serve the interests of the whole country to grant to every State having one million inhabitants or less one Senator, and to allot to each State having over one million of inhabitants an additional Senator for every additional million. This would not change the number of Senators, but, while not putting the Senate frankly on a basis of population, would remove the present unjust ratio and the opposition to the admission of new States, whose area and development entitle them to self-government, but whose population does not entitle them to two Senators.

The election of President, too, even as it has been improved, still leaves much to be desired. It readily lends itself to the choice of a minority candidate. It is an anomaly that one thousand one hundred votes—as in New York in 1884—should swing seventy electoral votes, thirty-five from one candidate to another, and thus decide an election. But preserving the electoral vote system as now, and giving the smaller States still the advantage, it might yet be possible to divide the electoral vote of each State, according to the popular vote for each candidate, giving each his pro rata of the electoral vote on that basis, the odd elector being apportioned to the candidate having the largest fraction; so that in New York Mr. Blaine would have had seventeen electoral votes and Mr. Cleveland eighteen. Other States would also have been more or less evenly divided, but the result would be that the choice of President would no longer be restricted to two or three States as in our past history, and as is likely always to be the case as long as the whole electoral vote of two or three large pivotal States must swing to one side or the other and determine the result. This change would avoid the present evil of large sums of money being spent to carry the solid electoral vote of a large pivotal State; for there would cease to be "pivotal" States. At the same time, it would avoid the open gulf into which a per capita ballot by the whole Union would lead us.

By the Convention of 1787 the term of the President was originally fixed at seven years and he was made ineligible for re-election. This was reduced to four years by a compromise that he could be re-elected without limitation. It was in the interest of those who favored a strong government and a long tenure. Washington imposed a limitation by example, but it will not always be binding. An amendment making the term six years and the President ineligible to re-election has long been desired by a large portion of the public. Indeed, when the Constitutional Convention of the Union shall assemble, as it must some day, to remodel our Constitution, it is more than probable that the powers of the Executive will also be restricted. His powers are now greater than those of any sovereign of Europe except Russia, and the real restrictions upon him at present are not

constitutional provisions at all, but the Senate and Judiciary.

But by far the most serious defect and danger in the Constitution is the appointment of judges for life, subject to confirmation by the Senate. It is far more serious today than it was when the Convention of 1787 framed the Constitution. It is too serious a matter to be considered in this article, which has already gone beyond desirable length. I only suggest it, as one of the greatest defects in our present Constitution.

RALEIGH, N. C.

Paying Taxes in Rhode Island

By LUCIUS F. C. GARVIN

EX-GOVERNOR OF RHODE ISLAND.

AS a rule nobody objects to being forgotten by the assessors of taxes. The exceptions to this rule are to be found in the cities of Rhode Island. Strange as it may seem to outsiders, in those cities men worth many thousands of dollars have tried year after year to become taxpayers only to find their appeals rejected by the boards of assessors.

The explanation is this:

Under our State Constitution no one can vote for members of a city council unless he is taxed for property valued at not less than $134. The property may be real or personal, but if the latter the tax upon it must be paid a few weeks before the November election, else the qualification lapses.

This provision of the Constitution invites partisan trickery on the part of political managers, who are interested in maintaining an unbroken supremacy in the cities. The laws, too, help to the same result by giving the election of city assessors to the boards of aldermen, whose members are specially interested in manipulating the property-voting lists. As a consequence city wards which would be doubtful politically if none but voters owning real estate had the franchise, are converted into Republican strongholds by the padding by the assessors of the personal property lists.

For example, the fifth ward of Central Falls, in which live many mill operatives, had in November, 1905, real estate voters to the number of 132, pretty equally divided in political sentiment between the two parties. The assessors, however, placed upon the property list, qualified equally to vote for members of the city council, the names of fifty-seven men as owners of personal estate. Of that number, I am credibly informed, two only were Democrats, altho many of that persuasion have applied in vain to the assessors.

To illustrate: About fifteen years ago George W. Greene, Esq., of Woonsocket, subsequently Mayor of that city, sought repeatedly to be assessed upon personalty, but being an active Democrat, he was refused again and again. In order to become a qualified voter for city affairs he purchased some real estate, thereby securing a full franchise. That same year he was assessed, not only upon the real estate he had purchased, but also upon personal property to the amount of many hundreds of dollars.

In many of the towns of the State the assessors of taxes are elected by the people, but in every city they are chosen by the board of aldermen. The effect in cities is to constitute a vicious circle. The assessors, being under obligations for their office and its salary to the council, so fix the property lists that there can be no change of party and, frequently, no getting rid of present incumbents. It is a common thing in the cities for the taxes of large numbers of personal voters to be paid by the party organization, in order that this select and subservient class may attend the caucuses,

as well as the polls, in the interests of councilmen and, indirectly, in the interests of the assessors themselves.

The case of Luke O'Connor, of Pawtucket, illustrates the curious situation very well. Mr. O'Connor was naturalized in the United District Court at Providence on May 27th, 1903. That year he was a registry voter, but finding that he had no right to vote for the most important part of the city government, the city council, he made up his mind to qualify.

The action necessary for him to take was made known to him in the month of June, 1904, by the following advertisement signed by the assessors of taxes:

"Notice is hereby given that . . . in conformity with the law in relation to the assessment of taxes, every person, copartnership and body corporate liable to taxation is hereby required to bring to the Assessors a true and exact account of all his or their ratable estate, describing and specifying the value of every parcel of his or their real and personal estate. For the purpose of receiving such accounts the Board of Assessors will be in session in their office," etc.

Consequently, in July, at the time and place appointed, Mr. O'Connor appeared before the board, exhibiting his bank book showing a deposit of $176.96, together with other personal property amounting to $200, to all of which, according to law, he was prepared to take oath.

In August he received a printed notice to the effect that he must pay a poll tax of one dollar.

Thereupon Mr. O'Connor made complaint to Mayor Higgins that the board of assessors refused to obey the law.

In response, the Mayor wrote Mr. O'Connor, criticising the board for its failure

"to assess voters who have been previously assessed and paid their own taxes, while at the same time they continue on the list men who never pay their taxes," etc.

In September following, Mr. O'Connor sent to the board a check for $3.30, the proper amount for a personal tax upon $200. The check was returned, with the statement that the only tax assessed upon him was a poll tax of one dollar, which, of course, conferred no right to vote for city council.

This tax he refused to pay. Consequently, on the 13th day of September, 1904, he received the following:

"This tax must be paid within five days from date of demand, or warrant will be issued for your arrest."

On September 22d he was arrested and committed to jail for non-payment of poll tax. The cost of his release was $6.58, paid to the warden of the state's prison "for the city of Pawtucket tax."

Subsequently, Mr. O'Connor sought redress from me as Governor of the State, an official who has very little exective power of any kind; afterward from President Roosevelt. Finally he stated his case to Mr. Bourke Cockran, who advised him to leave Pawtucket.

Mr. O'Connor, however, is not one of the runaway kind, as might have been inferred from his record as an active member of a liberal club in Blackburn, England. So far from abandoning the fight for his rights, he has now bought some real estate taxed for $300 or $400. But there remains just one way for the assessors to prevent Mr. O'Connor from voting upon his property, and that is a method which they have been known to adopt under similar circumstances. They can fix the valuation of his lot at less than $134, and in that way disfranchise him as a voter for the city council.

It is possible that an appeal to the courts might succeed in forcing the assessors to levy a tax in such instances as that of Mr. O'Connor, but such litigation is expensive, and has rarely, if ever, been resorted to.

Democratic members of the Legislature have repeatedly introduced acts transferring the election of city assessors from the aldermen to the people. Either this, or appointment by the Mayor, who is chosen by the entire electorate, would do much to lessen the abuse.

But the real remedy is to be found in the abolition of the property qualification now required of voters for members of the city council. That can be done only by a change in the State Constitution, and it is one of the reasons why a complete revision of the organic law is demanded by a large majority of the people.

LONSDALE, R. I.

Literature

The Duke of Argyll's Autobiography

Apart from the personality and the achievements of a public man who writes an autobiography or whose memoirs are written, it is usually possible to indicate why a particular autobiography or biography makes an appeal to students or lovers of this class of literature. In the case of the Duke of Argyll's autobiography* this is easy to do. It differs in two particulars from most British biographies. It deals with political and social life in Scotland as well as in England; and more than any biography of recent times, except perhaps that of Earl Granville, it deals with life almost exclusively from an aristocratic point of view.

In the earlier pages, when the Duke is surveying social and economic conditions in Scotland in 1847, when he came into the dukedom, there are glimpses of social conditions other than aristocratic. It is difficult indeed to recall any other biography, unless it be that of Hugh Miller, in which social conditions in Scotland in the middle years of last century are better or more fully presented. These chapters are among the most interesting and most informing in the two volumes; for they are well written and unfold much that is new regarding Scotch rural life, even to those who may be disposed to pride themselves on their knowledge of the history and social conditions of North Britain. They also afford remarkable proof of the progress of Scotland since manufacturing began on a large scale, great centers of trade and commerce such as Glasgow, Dundee and Aberdeen came into existence, and the country was opened up by railways. But even in these pages the Duke of Argyll is describing things from above; and from the time he went into the House of Lords as Baron Sundridge, certainly from the time he joined the Aberdeen Cabinet of 1853-55 as Lord Privy Seal, it is British politics and English and Scotch social life from an aristocratic point of view that are unfolded.

The Duke had the misfortune never to have been of the House of Commons, because while his family from the Union in 1707 to the Reform Act of 1884-5 controlled the representation of the county of Argyll, little more than three years intervened between his coming of age and his accession to the dukedom. He always regretted that his apprenticeship to public affairs had not been begun in the House of Commons. But there surely never was a peer who was prouder of the House of Lords than Argyll. He describes as "passionate nonsense" Gladstone's well-remembered charge against the peers that they live "up in a balloon." "They mingle," Argyll declares, "with other classes in society. They belong to the same political parties. They stand often on the same platform. They read the same newspapers, and the line between peer and commoner is invisible and imperceptible in all the business relations of life."

Besides thus defending the peers as individuals, and affirming that the aristocracy never had any prejudices against new men, Argyll in these pages often defends the traditions of the House of Lords; sometimes with more zeal than historical accuracy; as, for instance, when he asserts that the House of Lords opposed Parliamentary reform only for one year, while the House of Commons had opposed it for sixty years before it passed the Reform bill in 1832. The year Argyll had in mind was 1831, when it needed threats of the creation of many new peers to induce the Bourbon Tories in the Upper House to agree to the Reform bill. But he ignores the motions for reform which Richmond and Lauderdale had made in the House of Lords long before the question was taken up by Grey, Althorp and Russell in 1830; and likewise in his defense of the Upper Chamber he ignores the bills for the abolition

* George Douglas, Eighth Duke of Argyll, K.G.K.T. (1823-1900.) Autobiography and Memoirs. Edited by the *Dowager Duchess of Argyll.* With Portraits and Illustrations. In two volumes. New York: E. P. Dutton & Co. Pp. xi, 602; vi, 635. $10.00.

of slavery which were passed by the House of Commons only to be rejected by the House of Lords. He equally ignores the summary way in which the Lords made an end to Whitbread's bill establishing a national system of education which was passed by the House of Commons in 1811.

Argyll often writes from the inside. He was of the Aberdeen Cabinet in 1853, when Gladstone was responsible for the Budget of that year, and by his handling of the troublesome questions of the income tax and fiscal reform made a long and flying leap in his ascent to power. A whole chapter is devoted to Gladstone's budget; and nowhere else in print, not even in Morley's "Life of Gladstone," is there a fuller or more sympathetic story of how Gladstone then acquitted himself and immediately stood forth as a statesman of magnificent performance. Morley devotes a chapter of nineteen pages to "The Triumph of 1853"; but he is concerned most with Gladstone's great performance in the House and its reception by his fellow members and the country. Argyll does what was not possible for Morley. He describes with picturesque detail, in what is undoubtedly one of the best written chapters of his autobiography, Gladstone's three hours' conversational exposition of his famous fiscal proposals to the Aberdeen Cabinet, assembled in "a small and rather shabby room looking into Downing street," and how by this exposition Gladstone persuaded his colleagues of the Cabinet to abandon all idea of a differential income tax, which was then, as now, popularly demanded, and agree to his proposal for the continuance of the tax on a uniform basis, and its use as a means of continuing the fiscal reform which Peel had begun when he repealed the Corn Laws in 1846:

"I never heard a speech, even of the highest oratory," writes Argyll, "which so riveted my attention and that of all my colleagues. During the three hours of this wonderful performance we had all sat on our chairs as still as mice, spellbound under the hands of the magician. For a moment we remained so, as if our minds were full of an intellectual enjoyment, and our ears were filled by the tones of that persuasive voice. I do not believe that Gladstone had confided in any of his colleagues, except perhaps in Aberdeen. His grave face showed no emotion, except just a little of a satisfied smile."

Gladstone was forty-four at the time of this wonderful triumph. Argyll was his junior by fourteen years. Both men were continuously active in English political life for forty years after 1853. Argyll was soon to differ from Gladstone over the Civil War in this country. He parted company politically with him in 1881 on Irish land legislation; and from 1885 onward Argyll and Gladstone were as far apart as it was possible for two men to be on the question of Home Rule for Ireland. It tells much of the high character of Argyll, and is suggestive and illuminating as to the amenities of public life in England that Argyll should have written this splendid tribute to Gladstone's success of 1853 long after he had ceased to have anything in common with Gladstone in the political causes for which Gladstone stood in the last ten years of his public life.

It has been remarked that Argyll's point of view is always aristocratic. This, however, is not so as regards the Civil War. His sympathies were openly with the North; and there is nothing in these two volumes which can be pleasanter reading to Americans than his statement of his position during the War of 1861-65, and his estimates of Prescott, Emerson, Sumner, Motley and Mrs. Beecher Stowe.

Since Morley's "Gladstone" was published in 1903 there has been a steady stream of unusually good biographies from England. Argyll's autobiography has not the historical and international value of the "Life of Gladstone." Not more than one such book can be expected in a generation; but its point of view and its many-sidedness give it an interest only a little below that of Gladstone's "Life," and to many readers the appeal it will make will be quite as strong.

The Door of Humility

In the *Door of Humility,** Alfred Austin, Poet Laureate of Great Britain, has crystallized the emotions of middle age. The poem, in sixty-seven stanzas, is presumably self-revelation. It records the emotions of a man who, in his youth, imbibing much ancient and modern philoso-

* The Door of Humility. *By Alfred Austin, Poet Laureate.* New York: The Macmillan Co. $1.50.

phy, has become an "exile from the universe." Worse still, the universe from which he is thus self-exiled is a "non-moral universe." For these and other reasons not entirely transparent, the poet starts out to reconcile Faith and Reason. The task has enormous handicaps. It is interesting to watch the struggle, even tho we cannot lend our sympathy. "Faith," as exemplified in the character of a devout and beautiful girl, is, with Alfred Austin, merely traditional ritualism, and at its best but a kind of intellectual suicide; and the "Reason" which has led the poet into the dilemma is the narrow logic of the medieval schools. Reason, indeed, or its result, becomes sufficiently wearisome for the poet to strike the keynote:

"O, let me know a little less
That I may feel a little more."

The girl, usually referred to as "Her," is symbolically named Monica. He meets her in the spring:

"She comes from Vicarage Garden, see!
Radiant as morning, lithe and tall,
Fresh lilies in her hand, but she
The loveliest lily of them all."

Together they enter the church and she decks the altar with their blended blossoms. But he forgets the worship in the worshipper. In his childhood he has been taught to kneel and pray and had felt "a vague communion with the sky." But now he is pledged to "Reason." He still kneels, but he prays no longer. The ritual is vain, tho still revered. Such a man challenges shrine and scepter with his logical lance-point, and,

"His gods are many or are none,
Saturn or Mithra, Christ or Jove,
Consorting, as the Ages run,
With Vestal choir or Pagan drove."

He must dwell apart from those who have creed-subscriptions; but he will not share his pain with the girl, tho she divines his meditations. Monica writes him a farewell letter:

"Nor must we meet to speak good-bye,
Lest that my Will should lose its choice,
And conscience waver; for then I
Should see your face and hear your voice."

In Switzerland he cross-examines Nature in detail. He demands Whence? Whither? and Why?

"I ask the dark, the dawn, the sun,
The homeward-pointing peaks of snow,
Lofty and low alike, but none
Will tell me what I crave to know."

This trial of Nature continues in Italy, and Alfred Austin paints a fine verse picture of Florence, "found fairer than her fame," and in art and learning "more than a foster nurse." But who comes thither now to worship at comely altars and frescoed shrines?

"Men throng from far-off stranger-land,
To stare, to wonder; not to kneel,
With map and guide-book in their hand
To tell them what to think and feel."

Amid the wrecks of Rome the poet still feels the Olympian presence:

"You cannot kill the Gods. They still
Reclaim the thrones where once they reigned,
Rehaunt the grove, remount the rill,
And renovate their rights profaned."

But in Rome also is Christ's Vice-regent, who "Blesses with uplifted hands the city and the universe." The glamor of the Eternal City almost induces the wanderer to find peace in a Church which for long centuries has fed man's hope and been a Doorway of Humility. Indeed, he discerns that "every road may lead to Rome":

"He is perplexed no more, who prays,
'Hail, Mary Mother, full of grace!'
O, drag me from Doubt's endless maze,
And let me see my Loved One's face!"

Still another ritual is found at Constantinople, where a Masculine God "shares not his God-head with a Virgin mother," but delights with man in the lust of the sword and spear, and foretastes the promised reward of the ruddy lip and rounded limb.

Passing on to Athens, he finds "all the oracles are dumb." Olympus is a sepulcher of the Gods and a tomb of dead divinities. But at Delphi there is an unseen oracle which warns him that Song should not be silenced by Sorrow. Imagination is to wed sorrow and beget serenity and self-control.

This is the beginning of the end of the pseudo tragedy. At Delphi he hears that Monica is dying, confessing that she has prayed and sighed her life away. She writes:

"My conscience waneth less severe
In softness of the setting sun.
"'Twas I, 'twas I, far more than you
That stood in need, as now I see,
Stooping to enter meekly thru."
The Doorway of Humility."

Monica learns too late that she has sinned against Love's sovereignty:

"Now, Death, the mirror unto Life,
Shows me that nought should keep apart
Those who, tho sore perplexed by strife
'Twixt Faith and Doubt, are one in heart."

The New Discoveries of Science

PROFESSOR LANCASTER, in his presidential address before the British Association for the Advancement of Science two weeks ago, said it was a great privilege to live in an epoch like the present, which would stand out forever in human history as the period in which new chemical elements of astounding properties were revealed with extraordinary rapidity. Yet we fear that there are a great many people now living who do not appreciate the privilege, and, indeed, do not take the trouble even to keep informed on the discoveries which in the last five years have made for science a new heaven and a new earth. Not long ago astronomers were engaged in calculating the rate of cooling of the earth. Now it is a question whether the earth may not be heating up. They used to have a hard time inventing ways by which the sun could keep up its heat. Now they have radium "to burn." If a small fraction of one per cent. of the sun consists of radium it would be sufficient to account for its heat, and since helium, one of the products of decomposition of radium, is known to exist in the sun—in fact, was first discovered there—it is probable that radium exists there also. Everything that we used to know about cools off when it is left to itself, but radium tends to get hotter all the time.

It is, of course, difficult for the general reader to keep up with the advance of science, even if he cares to, because, for the most part, the record of its progress is only to be found in voluminous and technical publications. But the discoveries in radio-activity have been so spectacular as to excite unusual interest outside scientific circles, and there are several good books obtainable on the subject, besides such magazine articles as that of Dr. Le Bon's, which we published some weeks ago. Duncan's "The New Knowledge" we have before commended. Professor Jones, of Johns Hopkins University, has recently given us a reliable and comprehensive account of the new discoveries and theories.[1] It does not contain mathematics enough to scare anybody, and should be entirely comprehensible to those who have the use of the ordinary language of physics. The facts are clearly stated and neatly summarized, but without any attempt at adventitious ornamentation to catch the attention of the casual reader. In fact if Professor Jones had not followed quite so closely the historic order of discovery, to which in all his books he is too much attached, and had arranged the matter solely with a view to simplicity of presentation, he could have reached a wider audience without detracting anything from the scientific value of his book. A few good diagrams would also help immensely.

For this reason even the layman will very likely get as much from Professor Rutherford's larger and more technical work on radio-activity,[2] provided he knows how to skip what he cannot understand. The following passage gives a good example of his clear style, as well as one of the most interesting facts in connection with the new element:

> "The changes in radium are thus fairly rapid, and a mass of radium, if left to itself, should, in the course of a few thousand years, have lost a large proportion of its radio-activity. A mass of radium left to itself should be half transformed in 1,300 years, and only one-millionth part would remain after 26,000 years. Thus, supposing, for illustration, that the earth was originally composed of pure radium, its activity per gram 26,000 years later would not be greater than the activity observed today in a good specimen of pitch-blende. Even supposing this estimate of the life of radium is too small, the time required for the radium practically to disappear is short compared with the probable age of the earth. We are thus forced to the conclusion that radium is being continuously produced in the earth. . . . Both thorium and uranium fulfill the conditions required in a possible source of radium."

For the student Professor Rutherford's book is of the greatest value, for it gives a comprehensive summary of the whole field, including the experimental results and the mathematical discussion of them. No one else in America has done so much original work in radio-activity as Professor Rutherford, and we are envious of Canada that he is not on our side of the border. We have tried to get him to come to us, but he seems destined to the Cavendish Laboratory of Cambridge University.

This freshet of new facts threatens to carry away all the ancient landmarks of science. The most firmly established the-

[2] RADIO-ACTIVITY. *By E. Rutherford.* New York: The Macmillan Co. $4.00.

ories, being subjected to a more vigorous criticism, are found to contain unsuspected logical flaws, and it is questionable whether they can be stretched wide enough to cover recent discoveries. What becomes of the laws of mechanics if mass is purely electro-magnetic and therefore variable? And we cannot desert the atomic theory like a sinking ship and take refuge in thermodynamics, because here Carnot's principle is in question.

Outsiders are surprised that scientists are not alarmed and humiliated at this apparent "bankruptcy of science." But if these timid or scornful laymen will read Professor Poincaré's *Science and Hypothesis*[3] they will learn that revolutions in science never go backward, and that they are not so destructive as they seem to be. It is a book which ought to be much more widely read than it is likely to be, for students and investigators in science are usually careless about examining the foundations of their work. Professor Poincaré is one of the most brilliant and original thinkers of our day. The Bolyai Prize was recently awarded to him by the Hungarian Academy of Science as "unquestionably the most powerful investigator in the domain of mathematics and mathematical physics." And withal, being a Frenchman, he is able to write in a vivacious style. No Englishman, still less a German, would dare to talk of the fundamental principles of his science in so lively a way. The secrets of the trade of the man of science have never before been exposed so frankly. He shows how the progress of science has been at times impeded by too much knowledge. "If Tycho had had instruments ten times more precise, neither Kepler, nor Newton, nor astronomy would ever have been." Most discoverers have deceived themselves, and thereby advanced science, by formulating laws which were afterward proved to be too simple and exact to correspond to the real irregularity and complexity of nature. But a false hypothesis is often of more service than a true one, because it leads to new discoveries. Some of the most valuable of the hypotheses of science are those that can never be refuted or verified, because they are purely conceptual. They are neither true nor false; they are useful. And Professor Poincaré's main object is to show how hypotheses are useful and why they are justifiably held to have more value and precision than the experiments which served to demonstrate them.

Italian Romance Writers.

NOT till quite lately was it held discreditable, even to students of literature, to be ignorant, or at most vaguely conscious, of the achievements of the contemporary writers of fiction in Italy. Some knowledge of Manzoni, and perhaps Guerrazzi or d'Azeglio, was, indeed, expected of all with any pretension to literary culture. But until the name of one now notorious writer flashed into prominence some years ago, only those who had been fortunate enough to make Italy their home, or at least their headquarters, thought it necessary to dig deep into the field which Mr. Joseph Spencer Kennard has explored and opened up for us in his *Italian Romance Writers.**

Mr. Kennard would have us believe that the subserviency of the Italian writers to French "naturalism" or "realism" (typified in Zola) has ceased to be noticeable. He assures us that "all those earlier Italian champions of naturalism" are "now writing psychological novels." But he fails to give satisfying reasons for his assertion. Nor is it clear that, in his own mind, or in the minds of the Italian modernists, there is much difference between naturalism (or realism) and psychological romance which grounds fiction on truth.

As a book of reference *Italian Romance Writers* has its value. Its usefulness, however, lies rather in the information which it supplies regarding the lives and characters of the authors with whom it deals, and in the analyses of the stories told in their novels, than in its criticism. Mr. Kennard had evidently read widely and thought earnestly before formulating his opinions. But he seems incapable of expressing opinions

* ITALIAN ROMANCE WRITERS. *By Joseph Spencer Kennard.* New York: Brentano's. $2.00.

simply, plainly or convincingly. At its best his style is hardly brilliant. At its worst it is intolerable.

Yet one may pardon much in it for the sake of the facts which it conveys regarding the slow evolution of the Italian novel from the simple and sincere romanticism of "I Promessi Sposi," that masterpiece of Manzoni, to the romantic realism of Nievo's "Memoirs of a Man of Eighty," the picturesque and wholly admirable realism of Verga, and the psychological sensualism of d'Annunzio. Before Manzoni's day there had been wonderful poems, great tragedies, interesting comedies and remarkable autobiographies in Italy. But Manzoni, in "I Promessi Sposi," may fairly be said to have fathered the Italian novel. For this and other equally appealing reasons a conspicuous place is reserved for him in our essayist's scheme. And it is but fair to Mr. Kennard to admit that his enthusiastic appreciation of some recent authors has not prevented him from perceiving and rendering justice to the beauties of their less sophisticated, but infinitely more respectworthy forerunner. "I Promessi Sposi" has been rightly welcomed as part of the world's literature. As a picture of manners, as a chapter in the history of the Lombards under the dominion of Spain, as a piece of writing pure and simple and as a study of souls, it deserves the reputation that it has long since won. Fascinating, too, each in its own way, is the "Ettore Fieramosca" of Massimo d'Azeglio and the "Beatrice Cenci" of Francesco Domenico Guerrazzi altho the latter of these works owed much to Shelley and possibly also to Victor Hugo, while the former was an unblushing and exaggerated effort to outdo Walter Scott.

One of the most careful and scholarly chapters in the volume under review is devoted to the lifework of that upright patriot and true artist, Ippolito Nievo.

"Nievo, whom fame has long ignored and now condescends to praise, is not one of the world's greatest writers, yet does he possess some of all the qualities for which other great writers have been admired: some of Flaubert's penetration softened by some of Tolstoi's pity, enlarged by some of Goethe's philosophy, and enlivened by much of Le Sage's good sense."

Diderot, Voltaire and Jean-Jacques all influenced Nievo. But the most potent of the factors which molded him, as it molded many another Italian man of letters of Nievo's time, was his love of that fatherland for which, with Garibaldi, he donned the red shirt and defied tyrants.

Like others who have written about the literature of Italy, Mr. Kennard attaches more importance than their works warrant to that facile and amiable deviser of sentimentalities, Edmondo de Amicis, and to that occasionally brilliant, but erratic and immoral, chronicler of Neapolitan scandals and morbidities, Matilde Serao. With the exception of her "Suor Giovanna della Croce," which has unusual merit, both as a study of lamentable conditions and as literature, the books which, thanks to her journalistic training, Matilde Serao turns out so easily and carelessly, are of merely ephemeral interest. Yet, notwithstanding the familiar aphorism, they are not hard reading. Hence their popularity, in the original and in translations. Vastly more serious than either of the two last-named writers is Antonio Fogazzaro, whose "Il Santo" has caused so much disturbance in Rome. Unlike nine-tenths of his Italian contemporaries, who are materialists and sensualists, Fogazzaro is, according to his lights, a purist —a believer in religion and an upholder of ideals. His "Malombra" is "the cry of a mind tormented by doubt." In his "Daniele Cortis" he reveals to us a soul resting in recovered faith; while in "A Little Old-fashioned World" he contrasts a dreaming religionist named Franco with his wife, Luisa, a stronger but more worldly type of idealist.

In many ways (and without excepting even that spoilt darling of the hour, Gabriele d'Annunzio) the most interesting, original and daring of recent Italian writers is probably Giovanni Verga, the great realist, the inspired student and describer of Sicilian life and character, to whom the world is indebted for "Cavalleria Rusticana," "La Lupa" and "I Malavoglia." Verga is a realist and a realist of the most honest kind. His tales and novels (and more particularly his tales) are miracles of observation, redolent of the soil and admirable as literature. Yet how many Americans have read the *chef d'œuvre* on which were founded not only a play, but also the

libretto of an opera which are now household words here? To the average American the romance writers of Italy begin and end with Manzoni and d'Annunzio. And for one who could tell the plot of "The Betrothed" ("I Promessi Sposi") ten would be able to give a more or less intelligible, if not intelligent, account of that triumph of morbid and revolting sensualism, "Il Trionfo della Morte," or to chatter about the loves of Stelio Effrena, that embodiment of complacent and poetic bestiality, and his pathetic mistress. It is difficult for an Anglo-Saxon to speak without indignation and loathing of d'Annunzio's attitude toward the decencies and moralities of all the ages. None the less must it be acknowledged that the inventor of "Il Fuoco" and "Piacere" and "Le Vergini delle Rocce" is a poet and novelist of rare powers, even if, as Mr. Kennard very truly says at the conclusion of his book, he is "ignorant of the majesty of the human soul, of the sublimity of human existence and of the powers of the world to come."

The Fumigating Brigade in Panama. From Forbes-Lindsay's "Panama." Winston.

Panama: The Isthmus and the Canal. By C. H. Forbes-Lindsay. Philadelphia: The John C. Winston Co. $1.00.

Mr. Forbes-Lindsay has gathered from many sources the chief facts relating to the history of Panama and the Canal, so the book is very convenient for reference or for reading by one who wishes to get a brief general view of the situation. He has not, however, shown any skill in arranging his material. The volume contains many repetitions, not a few contradictions, and is generally incoherent. Part of it was apparently written a year ago, part last December and part in the early spring, and these comments are run together without harmonizing and without cutting out or down the discussions and prophesies which by the changed event had become obsolete and useless. The author is indiscriminatingly eulogistic of all the acts of the Commission and the conduct of affairs in general on the Isthmus. One who had a first-hand knowledge of the Panaman management would not say, as he does, that there have been no blunders, no favoritism, no political influence in appointments, no opportunity for graft, and that all purchases have been made according to strict business principles. But this lack of co-ordination and critical discrimination, tho it mars, does not destroy the value of the book. It contains some account of the romantic history of the Isthmus, a description of old and new Panama, and a history of the early projects of canal construction

and of the work under De Lesseps, which includes many details that we had failed to find elsewhere. The rival plans for the canal are discussed at length and there is a very good clear map and elevation of the 85-foot type now adopted. An appendix contains much valuable data on the cost and workings of all the great canals of the world.

The Book of Tea. By Okakura-Kakuzo. New York: Fox, Duffield & Co. $1.10.

Teaism, as a recognized cult, is virtually unknown outside of China and Japan; for the devotees of tea in Europe and America are devotees more from force of habit than from personal conviction. Even in China, where the cult had its inception, tea drinking is now rather a ceremonial of polite society than a religious observance. In Japan, on the other hand, teaism is a religion in itself. It is the worship of the beautiful, the apotheosis of estheticism; in short, Taoism in disguise. The Japanese drink their tea in precisely the same spirit of reverence as they burn their incense—and with much the same motive. The main point of difference is that the one act is a tribute to the ideal abstract and the other to the ideal concrete. What "Sartor Resartus" is to the realm of the utilitarian *The Book of Tea* is to the realm of the esthetic. Dress has its Carlyle, and "the cup that cheers" its Okakura-Kakuzo. Within the pages of this volume is condensed the whole philosophy of tea, together with its history, poetry, symbolism and a synopsis of its relation to religion and art as they exist in Japan. The author writes with sympathy—as is natural—and with a graceful felicity of expression, which is, perhaps, equally natural; for there is no people on earth more essentially and intensely poetic than the Japanese. It may have been this very quality which prevented the peoples of the Caucasian race from taking them with the seriousness they really merited—until they had won their spurs on Manchurian battlefields. The author, with pardonable bitterness, says in this connection:

"Fain would we remain barbarians, if our claim to civilization were to be based on the gruesome glory of war. Fain would we await the time when due respect shall be paid to our art and ideals. When will the West understand, or try to understand, the East?"

Pebbles.

"WHEN he proposed, did you tell him to see me?" inquired her mother.

"Yes, and he said he'd seen you several times, but—but, he loved me just the same."—*Pittsburg Dispatch.*

HE KNEW.

"SAY, Briggs," said his chum, "do you know what women are wearing this spring?"

"My wife for one," replied Briggs, sadly.—*Saturday Evening Post.*

A LITTLE Cheyenne boy was being reproved by his mother. "Charlie," she said, "if you behave like this, you know, you won't go to heaven." The child thought a little and then said: "Well, I've been to two circuses and to 'Uncle Tom's Cabin,' and I can't expect to go everywhere!"—*Laramie Republican.*

IMPULSES.

"So you can't help stealing?" asked the magistrate, kindly.

"No, your Honor; an impulse comes over me that I can't resist."

"Too bad, too bad! An impulse to send you up for six months is getting hold of me. There, it's got hold. Six months; can't resist. Impulse is a wonderful thing."—*Chicago Tribune.*

MET HIS MATCH.

THEY were very fond of each other, and had been engaged, but they quarreled, and were too proud to make it up. He called afterward at her house—to see the old gentleman, on business, of course. She was at the door. Said he:

"Ah, Miss Blank, I believe? Is your father in?"

"No, sir," she replied, "pa is not in at present. Did you wish to see him personally?"

"Yes," was his bluff response, feeling that she was yielding; "on very particular personal business," and he proudly turned to go away.

"I beg your pardon," she called after him, as he struck the last step, "but who shall I say called?"

He never smiled again.—*The Gentlewoman.*

DINING OUT.

A PHILADELPHIA business man recently had as guest a friend from Toledo, an extremely busy individual, little familiar with the social graces.

For the first evening of his stay a dinner party had been arranged. The hostess had provided a most attractive young woman for the Toledo man; and it was thought that he would take a desperate fancy to her, which, indeed, he did.

When the guests had gathered and were ready to go out, the host, with his politest bow, said:

"Mr. Blank, will you please take Miss Dash out to dinner?"

"Certainly," responded the Toledo man, with alacrity, "but I understood that we were to have dinner here in the house."—*Saturday Evening Post.*

The Earth and Its Quakings

On last Friday morning when Professor Milne woke up in his home on the Isle of Wight in the English Channel and looked at the seismograph in his laboratory he saw that there had been a great earthquake during the night. When the photographic films recording the vibrations were developed he found that there were two distinct records. He had as usual received messages transmitted by two different systems of "wireless telegraphy." The first received was a tremor coming directly thru the earth, a compressional wave like that of sound in the air. The second came around the earth, a longer, slower and stronger undulation like a tidal wave, but in the ground instead of the water. From the calculation of their relative speeds Professor Milne determined that they originated 6,000 miles away, and he announced that there had been an earthquake on the Chilean coast as serious and extensive as that of California. He knew more than the newspapers, for the first reports mentioned only the damage done to Valparaiso and its immediate vicinity.

Professor Milne, in an address before the recent meeting of the British Association for the Advancement of Science, showed how these earthquake vibrations could be made to give us some indication of the nature of the earth's interior. The velocity of the first tremor that passes thru instead of around the earth depends upon its depth. If the chord along which it passes does not reach a depth of more than twenty or thirty miles its velocity is the same as that of the surface rocks. But along chords that lie deeper the velocity rapidly increases until it becomes nearly constant at twelve kilometers per second. We can get a clear idea of this form of earthquake transmission by recalling the familiar laboratory experiment of the suspended steel cannon ball on one side of which rested a little ivory or glass ball. When the cannon ball is tapped on one side the little ball on the other is instantly knocked away. But the rigidity of the interior of the earth is nearly double that of steel, and since steel has a rigidity six times that of granite and similar rocks forming most of the earth's crust, it is evident that the bulk of the earth must be very different from the surface layers that we are acquainted with. The density or specific gravity of the earth as a whole is 5.6, while that of the average of the surface rocks is only 2.8, so the interior of the earth must consist mostly of metals, or, if of rocks, they must be changed by the tremendous pressure of gravitation into a state very different from any that we are able to obtain or deduce from experiment. The metallic core theory is of late gaining over the gravitational theory.

The geologists have for a long time fretted under the limitations of the Laplacian nebular hypothesis imposed upon them by the astronomers. They wanted more time for the deposition and wearing away of rocks and for the evolution of living beings than the theory of a molten globe ten or even a hundred million years ago would give them, and they thought they knew several better ways to make mountains than by the wrinkling of a cooling earth. Professor Chamberlin, of the University of Chicago, has developed in his recently published "Geology" his planetesimal theory as a substitute for that of Laplace. According to this new theory the earth was never a gaseous or completely molten sphere, throwing off planetary rings as it contracted by cooling, but grew gradually from a swarm of meteorites which were drawn together by mutual attraction and amalgamated. Such a mass would heat up from gravitational compression and partially fuse, permitting a rearrangement of material by which the lighter would come to the top, as the slag covers the iron in the blast furnace. The rocks that we know upon the surface, therefore, give us no indication of what is beneath them. We have bored into the earth only about a mile, and the examination of the strata of sedimentary rocks as they are upturned in places leads us only a few miles deeper. The rest of the

3,900 miles we have to guess at. It is as tho the earth were a golf ball and we, not being able even to scratch thru the paint, were trying to find out whether it is solid gutta-percha or one of the new-fashioned kind with a patent nucleus.

Before the discovery of radium Professor Chamberlin had suggested sub-atomic energy as a possible source of the internal heat of the earth, and now that we know of rocks that are self-heating calculations have been made to see if there are enough of them to account, at least in part, for this heat. The surprising result was reached that this source supplied altogether too much heat. The radio-active minerals, such as thorium, uranium and radium, are found to be very widely distributed, tho in relative small proportion. Mr. R. J. Strutt, the son and heir of Lord Rayleigh, in the British Association session which we have mentioned, announced that from his examination of igneous and sedimentary rocks there was a sufficient amount of radium in the earth's crust within a depth of forty-five miles to account for the whole internal heat. We are driven then to one of two alternatives, either the radium in the interior of the earth is prevented by its diffuseness or by the conditions of temperature and pressure from developing its heat, as it does in the laboratory samples, or radium only exists in the superficial crust of the earth. Mr. Strutt holds the latter view, which agrees with the deductions of Professor Milne and others that at a depth of thirty or forty miles the composition of the earth is radically different from its surface.

Lord Kelvin, who has been the chief defender of the gravitation theory of the earth's heat, is not at all disposed to quit the field. He retorts by publishing in the London *Times* a sharp criticism of the Association for its too easy acceptance of all that has been published concerning radium and the far-reaching speculations based upon it. He does not believe that there is any evidence that radium changes into helium or that it is the cause of the heat of the earth or the sun. This warning from the veteran physicist may be needed, for it must be remembered that these revolutionary ideas, now carrying everything before them, are based upon the experiments of three or four men working in an unknown field by novel methods and dealing with quantities of matter too minute to be seen or weighed, or, in many cases, to be detected by the spectroscope. It is rather of a slender basis for cosmological theories extending back and forward hundreds of millions of years. But in the present chaos of opinion the layman is at liberty to hold that the interior of the earth is solid, liquid or gaseous, and he cannot be successfully contradicted if he believes that its core is made of gold, rock or nickel-steel.

Direct Election of Senators

THE terms of thirty United States Senators will expire next year. Not less than one-third of the vacancies thus caused will be filled by popular elections. In obedience to the Constitution, the Legislatures will go thru the form of electing these men, but the successful candidates will already have been chosen by popular vote at party primaries. Not many years ago the State Legislatures, or a considerable number of them, were passing resolutions in favor of a Constitutional Amendment permitting the election of Senators by direct popular vote. But there was no prospect that the desired change would be brought about in this way. Amending the Constitution in response to the resolutions of State Legislatures is a clumsy and slow proceeding. There was an easier way to reach the end which those Legislatures sought. This way has been found and used in more than a dozen States. Voters are empowered to name at their party primaries their candidates for a Senate vacancy soon to be filled, and then the party majority in the Legislature obeys the mandate thus given at the polls.

In Illinois, a few weeks ago, the Republican voters of the State at their primaries gave a majority of about two to one for the re-election of Senator Cullom, whose opponent was ex-Governor Yates. The formal re-election of Senator Cullom will follow. In eleven Southern States the same method has been used this year. At the primaries in Alabama, on the 27th inst., votes will be cast not only for two Senators, but

also for two alternates. Senators Pettus and Morgan are to be re-elected without opposition, but they are so old (the first being in his 86th year, and the second in his 83d) that provision is to be made for filling the place of either if he should die or become disabled. Mr. Morgan's term will expire in 1907; Mr. Pettus's in 1909. But the Legislature meets only once in four years, and the people will determine now who shall be appointed by the Governor to fill any vacancy occurring when the Legislature is not in session. There are seven candidates, and among them are ex-Governor Oates, ex-Governor Johnston, and Congressman Bankhead

At these primaries there will also be a vote for a candidate for Governor. The successful man will know whom he must appoint if either Senator Morgan or Senator Pettus be removed from his seat at Washington by disability or death. In Oregon, the people vote for Senatorial candidates first at their party primaries, and then at the regular State election.

While such an expression of preference is not legally binding upon a Legislature, there is no danger that it will be disregarded in any State where these methods are used, for candidates for the Legislature are pledged to carry out the wishes of the people as expressed at the primaries or polls.

There are indications that several other States will soon follow the example set by those which now elect Senators in this way. We hazard the prediction that in every State, twenty years hence, Senators (altho formally elected by Legislatures) will really be chosen by direct popular vote; and it will all be done without the aid of a Constitutional Amendment.

The sooner the better. It is a change much to be desired. A candidate for Senator should go before the people. They cannot be controlled by objectionable influences to which many a Legislative majority has surrendered. Very rarely will a Senator chosen at the primaries represent great corporations when he is elected, altho he may enter their service afterward. A candidate appealing to the people, and not relying upon the manipulation of a few members of a Legislature, must commonly stand for what he really is, and must be publicly committed to policies which he will not thereafter oppose. In every way he will be closer to the people, more in sympathy with them, than the average Senator selected by an unrestrained Legislature has been or can be.

When we look at a list of the Senators now in office and think of some others who preceded them we realize that in many instances the people and their States would have been more honestly and decently represented if their Legislatures had been bound or instructed by a preliminary popular vote. The people of New York would never have asked at primaries for the election of Thomas C. Platt. They might have chosen Chauncey M. Depew some years ago, for he had certain popular qualities which obscured the defects of his character and record, but only a handful of votes would be cast for him now if he were a candidate at primaries for re-election. Mr. Aldrich could not have appealed successfully to the people of Rhode Island in 1905. On the other hand, in Connecticut the late Senators Hawley and Platt could always have relied upon the support of the Republican masses in their State. The Republicans of Pennsylvania would emphatically reject Senator Penrose if he should now be a candidate at primaries. To these examples, taken from four adjoining States, others might be added.

We do not say that the people at primary elections will always make the best choice. It is possible to deceive and mislead them. But we are convinced that in a large majority of instances public interests will be better served by the direct popular selection of senatorial candidates than by the election of Senators by Legislatures which have received no such instructions or commands from the people.

Material Sympathy for Chile

When San Francisco was wiped out by earthquake and fire, the sympathy of the world was aroused. From our own country gifts flowed in by the million, and other lands were not content if they could not add their generous contributions. Now a severer earthquake has devastated Valparaiso and other smaller

...ities of the Chilean coast. Valparaiso has but about half the population of San Francisco, but the loss of life seems to be greater and the destruction of buildings as complete, while the smaller towns suffered more than in California.

Doubtless the people of Chile would be as generous as those of the United States if they could, but Chile is but a narrow strip of land, lying like a long snake between the Andes and the ocean, from Peru to Cape Horn, and all the inhabited part must have suffered, so that each town must care for its own sufferers. The entire country can give very little to aid its chief coast city. The neighboring and very sympathetic country of Argentina will help liberally, and thence will come the chief help, while Brazil will add her smaller quota. But from all South America there can come no such outflow of ready assistance as was quick to sympathize with our San Franciscan sufferers, for it must come from other countries of the continent, which have not our wealth. California could not expect very large aid from the neighboring Mexico, nor can Chile from Brazil.

All this puts a special duty of sympathy on the United States. The catastrophe comes just at the time when we are expressing, at Rio, particular interest in the South American countries. Our delegates are conferring with their delegates. We are taking part in the discussion of the Drago Doctrine and in the extension of the railway which shall unite us together. Secretary Root is visiting the South American countries, and is being received with great honor, and is expressing the good will of our Government. This sorrow forbids him to accept a reception in Chile. The best way of expressing good will is by liberal gifts. We would have the Red Cross take charge, with various local committees, who shall ask and receive the sympathetic gifts of the American people, in substantial amounts, for those who need our aid quite as much as did the sufferers at San Francisco. Thus shall we show that our expressions of good will are not mere words, and those suspicions of the good faith of the strongest of the American republics will be allayed.

Uniform Divorce Laws

It was in February of this year that a Congress of Delegates on Divorce was held in Washington. Full discussion of the desirable legislation was held and a committee appointed to draw up a proposed uniform statute for all the States and Territories of the Union. It is generally agreed that the regulation of marriage and divorce does not belong to the National Government, and that the end desired can be reached by harmonious legislation of the States. The decision of the United States Court in the Haddock case, discussed by us in our issue of August 2d, shows the need of inter-State agreement. At present persons may remain legally married in one State while legally divorced in another.

The committee, which will meet in St. Paul, September 1st, will have before it for consideration a full and very carefully elaborated statute for the annulment of marriage and for divorce. As it is likely to be adopted in substance and mostly in language and detail, we think it well to put the conclusions before our readers in less legal language.

The proposed statute has to do with three forms of separation; first, annulment of marriage; second, full divorce from the bonds of marriage; and third, separation, or divorce from bed and board. The latter is not a full divorce, and does not allow remarriage.

By the annulment of marriage is meant the declaration that the pretended marriage was never really valid, and is so declared. The causes allowed for annulment are incurable impotency, not known at the time of marriage to the one applying for annulment; consanguinity or affinity within defined degrees of relationship; proof that either party had a former husband or wife living at time of marriage; fraud or coercion, unless marriage has been confirmed by injured party; incurable insanity at the time of marriage, provided the other party was ignorant of it; and the fact that either party is under the age of consent (sixteen for males, fourteen for females) and has not confirmed the marriage after reaching age of consent.

Divorce from the bonds of matrimony, allowing remarriage, is limited to the

following conditions: Adultery, bigamy, conviction for crime, after imprisonment of the guilty party for two years (or one year in case of an indeterminate sentence); extreme cruelty, endangering life or health, or such intolerable indignities as compel the parties to live apart; wilful desertion for two years; habitual drunkenness for two years, accompanied by cruel treatment or indignities which render life intolerable and compel separation, or neglect to provide for the family.

Divorce from bed and board, such as the Catholic Church allows, as it does the annulment of marriage, are for the same causes, except that bigamy and conviction of crime are omitted, and hopeless insanity is added. These provisions give relief to those who do not believe in or do not desire an absolute divorce.

The entire statute as drawn up is a very long and elaborate one. It describes the proper proceeding and the proper defenses against a petition for divorce. It provides that trials for divorce shall not be secret, but in public; and also—a very important provision—that when a divorce is granted it shall not be finally in force for a full year, which will act as a bar against hasty divorces for the sake of another marriage; and it is specially provided that marriage will not be allowed with a co-respondent. Nor can divorce be allowed in one State for an offense committed in another State in which the offense is not allowed as an occasion for divorce. The provisions for a real residence in the State are very carefully drawn.

Already the movement for uniform legislation has made considerable progress; but just as at the Conference of The Hague it is desired that a model arbitration treaty should be formulated, so it is desirable that a model statute on divorce should be presented to our State Legislatures. This proposed statute seems to be admirably drawn. It is of no use to argue, against both reason and Bible, against all divorces. There are good causes for absolute divorce, inasmuch as marriage was made for man and woman, and not man and woman for marriage. We trust that this proposed statute, with the minor amendments necessary, will be generally adopted, and much marital disturbance will thus be relieved; and, what is of much more importance, divorce will be more seriously and deliberately considered, and thus the evil will be much reduced.

And now we are likely to learn with some approach to accuracy, what is the real truth as to the prevalence of divorce in the United States. The Census Bureau has taken up the matter, and will give us statistics which cover some years, and which cover the grounds for the divorce. We observe that one of the questions which the statistics will answer will be as to the number of cases in which intemperance is the proximate occasion for the divorce, even tho not so designated. But the assigned causes are, as all may know, very misleading. The cases are very numerous in which the real cause is concealed and another assigned which will cover scandal and prevent gossip.

A Vanishing Relation

Ladies whose nerves are worn to a frazzle in their hopeless struggle with the servant problem might have experienced queer sensations if they had read in the death notices the other day a paragraph announcing the end of a remarkable life. "At her own home," the notice read, the person to whom this tribute was paid had died; from which we may infer that she had accumulated a modest property. But this might be said of many humble and hard-working individuals, a few women among them. The remarkable fact was that which the notice went on further to state, namely, that for more than forty years the deceased had been "the faithful friend and servant" of the family which offered this word of appreciative memory.

Two or three generations ago such relations as this memorial disclosed were not unusual. In portions of the Old World they yet may be found, kind and dutiful relations between one who serves and one who is served, fidelity on the one side fully matched by appreciation, consideration and protecting care on the other side. Today, in our Western world, a single instance of the kind arrests our attention as a curious survival of bygone times.

To multitudes of men and women such a relation makes its appeal as something well-nigh ideal, and their first impulse is to question the quality of a social progress which has destroyed it almost utterly, and left us in a state of general dissatisfaction and distrust so far as all matters of direct personal service are concerned. We could almost wish that railroads and telegraphs, gas ranges and electric lights had never been invented if only the comfort and tranquillity of the bygone relations between the household and its servants could have remained to us.

Yet the second thought is better. It brings before us the incompleteness, the one-sidedness, the essential wrong of a system which made the old relations possible. Contentment and fidelity in the relations of personal service spring either from loyalty or from equality. In the old days they sprang from loyalty. In the days that are yet to come, freighted with richer blessings than mankind has ever yet enjoyed, they will spring from equality.

Loyalty is essentially a product of an accepted status of inferiority. The real thing exists only when the loyal servant is wholly without expectation of ever "rising in life," when from birth to death a reverent "looking up to his betters" seems to him a perfectly natural state of mind. The whole thing had its genesis in feudalism and a nice gradation of social ranks. It necessarily disintegrates and disappears in a democratic society. The semblance of it may remain here and there, but in a thousand ways the lack of substance is revealed. The butlers and the footmen of the household that has "struck oil," or that has converted a quarter section of alkali desert into "real estate," may wear faultless liveries and cleverly act their parts, but they are imitation butlers and stage-property footmen, for all that, and never by any possibility in a non-feudal community can they be anything else.

On second thought, then, if we are democratic in the good sense of the word, if we are glad that the injustices and inhumanities of an old order have passed away, we cannot hope for the return of that sort of loyalty on the part of household servants which was merely the extenuating beauty of an inherently wrong plan of things, like the moss and ivy on a dungeon tower. We must look to the future and plan for the amelioration of our present evil state in the only possible way. We can cure the ills of democracy only by more democracy. Let us not forget that the time was when the physician, the solicitor, the engineer and the author were social inferiors, whose subserviency to the well-to-do was little less abject than that of a tip-taking waiter. Thomas Gray makes his protest against this condition in the first couplet of his epitaph:

"Too honest to steal and too proud to importune,
He had not the knack of making a fortune."

If this is news to any of our younger readers, let them turn for a time from the best selling books of the current month and lay in a new stock of ideas from the pages of an author no more ancient than Dickens. And let not the wives and daughters of our new-rich manufacturers and merchants forget that, in the days of good Queen Bess, a merchant or a manufacturer would have said "sir" to a country squire whose annual rents wouldn't have kept a New York chauffeur in cigars. Except in the household we have substituted the free contract or the professional relation for the old plan of patronage and servitude, and when every criticism has been made, we admit that the new way is economically more satisfactory and ethically more fair than the old one was.

By imperceptible changes, but more rapidly, probably, than we anticipate, we shall in like manner specialize, transform and democratize the various domestic services. Already most of the old household work has been "put out," and more of it will follow. That which remains will be performed by persons no longer servants in the familiar sense of the word, but persons trained to do well specific things, and having, therefore, the independence and the self-respect of the professional class. Much of beauty and excellence there was in the old relation at its best, but in the new relation there will be a new excellence, and that fairest, as it is also the latest and the rarest, product of social evolution—justice.

The New Cancer Cure

It has been evident for the last year or two that a new focus of interest in our knowledge of cancer had been lighted, and there has consequently been an undercurrent of rather tense attention on the part of medical practitioners and patients. Important announcements were looked for and expectation has not been disappointed. This is not, however, the first time that high hopes have been raised, and it is devoutly to be wished that they shall not be, as so often before, completely dashed to the ground. To one familiar with the recent history of the vicissitudes of medical opinion with regard to cancer, even the present message of hope carries with it an inevitable burden of fear and doubt.

Within ten years there have been many seeming important announcements with regard to the cause of cancer. Just a decade ago many good workers in cancer investigation were sure that the malignant tumors were due to the action upon the tissues of a blastomycete—a form of ferment that grew by budding, as do the ordinary yeasts. Alas! it was found that the tumors due to this cause formed only a very minute proportion of the presumedly cancerous nodules, and these comparatively benign in quality. After this, the idea that cancer was due to a parasite took firm hold, tho it had been for long in abeyance, and certain parasitic appearances were described as concerned in its etiology. At the present moment, we venture to say that most of the world's cancer investigators are persuaded that the cause of cancer is a parasite, and at a prominent medical meeting in New York city within the present year the infectious nature of cancer was urged by men of large experience, who suggested the necessity for taking precautions against its spread.

In the last few years an entirely new aspect has been put on the cancer problem by the discovery that certain tumors in mice very closely resembled the cancers of human beings. It was found by many observers that these tumors might be communicated to other mice, tho they could not be conveyed to animals of other species. This gave a very interesting and practical turn to cancer investigation, since it made it possible to study malignant disease experimentally. Rewards were offered for all animals with tumors, and now there is not an animal dealer in the country who does not know that any animal with a deformed look may be a precious treasure for which laboratories will bid many times the ordinary price for the privilege of investigation and the study of inoculation results.

In the midst of this crisis of investigation comes the announcement of a cure for cancer. It has, of course, been looked for, yet it was hoped that it would be delayed until thoroly warranted by substantial results. Nearly one in thirty of all who die now are the victims of cancer. It carries off more persons than all the infectious fevers combined, if tuberculosis and pneumonia be excluded from the list. That means that it exceeds in fatality such dread diseases as small-pox, typhoid fever and all the children's diseases put together. The announcement of a cure, then, will literally raise hopes in the hearts of hundreds of thousands of people who are suffering poignantly from the almost absolute assurance that their malady is fatal. Surely, then, the remedy that claims to be successful should be tried on at least 100 patients before being given to the public as established. There is no dearth of material for observation and no ultra-conservatism on the part of surgeons to prevent immediate investigation. There are only too many cases of cancer in which surgeons are absolutely at the end of their tether and would be only too glad to try anything promising. Yet the recent sensational announcement gives details, and those by no means complete nor at all satisfactory, of but two cases, and mentions a third. There may be more in it than seems, but the method of exploitation is suspicious.

Less than five years ago there were published many hundreds of cases of apparent cures of cancer from treatment by the X-rays, yet at the present time there is no conservative observer who claims that the rays are of any service except in certain cases of external slow running cancer, for which the old-fashioned pastes and plasters still continue to accomplish quite as much as any other method of treatment. On the other

hand, the X-rays are known to have produced fatal cancer in a few cases when they were handled carelessly. After the X-rays came a little ripple of enthusiasm over the remedial effect of radium in malignant disease, but that took but a short time to die out except in the hands of a few over-sanguine specialists who had stacked up on radium.

It has been known for some time that the apparently cancerous tumors of mice occasionally disappear if a needle be thrust a number of times into the mass so as to cause rather free bleeding, especially near the circumference of the tumor. This disappearance was thought to be attributable either to the well-known anti-parasite of the blood serum, which would suppose the cancer due to a parasite, or to a certain ferment action or series of ferment actions, such as take place in freshly shed blood. It was also known that the serum of mice thus cured of their cancer would, after injection, produce immunity to inoculation of cancerous material in other mice.

Whether the sensational report from England really contains anything more than this widely diffused information remains to be seen. Possibly the ferment trypsin that has been used may be the active factor it is described as being. It is quite possible, however, that the bleeding within the tumor incident to the injections of this material may have been the remedial agent. We have not sufficiently detailed reports as to methods or final results to determine this. Meantime, it seems best that a very conservative attitude should be maintained in the matter.

The Resignation of Dr. Harris

The passing of Dr. W. T. Harris from active and controlling influence in American schools is a notable event. We were fortunate in having in our possession a handful of notes, penned by Mr. Harris several years ago, illustrating what seems to us to be the most interesting period of his career—the formative. He was, at the time of writing these notes, superintendent of the public schools of St. Louis. His name was already a power in America, and had been heard and recognized in Europe. He was known to be a student of philosophy of unusual grasp, as well as an educator of remarkable power. His thoroness and independence, combined with a very determinative will and a remarkably genial disposition, were impressing his views upon the whole American system. He began to gather into Missouri other independent and leading minds, and was specially aggressive in securing men of the Agassiz spirit, such as Johonnot and Straight—both students at Penikese. These men were placed in charge of the Normal School at Warrensburg.

The advent of Carl Schurz as a resident of St. Louis, and his election to the United States Senate from the State of Missouri, was contemporaneous with Mr. Harris's selection as superintendent. The children of this distinguished German had been trained in kindergarten methods, and he was himself a warm advocate of the Froebel ideas. Mr. Harris became convinced of the soundness of this method of child training, and as a consequence urged its incorporation in the public school system of the city. St. Louis not only has the honor of being the first American city to adopt the kindergarten, but the first to incorporate natural science studies in the primary schools. The old stuffing method of education was already destined to pass out in favor of that of individual investigation. Nature study was practically unknown up to that day—that is, as an integral part of public school training. Miss Peabody, of Boston, had the precedence but slightly of Miss Blow, of St. Louis, who was a cordial co-worker with Mr. Harris.

Soon after leaving Yale, and before reaching St. Louis, Harris had become somewhat intimate with Alcott and the Concord school of teachers. Under their guidance he began the study of Kant and Hegel. It is in reference to these studies that the following notes were drawn up by Mr. Harris in 1874. He says:

I began the study of Hegel about 1859. Had studied Kant for two years previous. Cousin had been enthusiastically studied before that. My progress in understanding Hegel, and indeed all of the great philosophers, has been very slow. I worked at Kant nearly a year before I could see at all what he was trying to say. I have gained regular advances from year to year for several years; each insight seeming to be an independent discovery on my part, and what I could vouch for on my own responsi-

bility, even if no one else had ever seen it before. In 1858 I arrived at the insight into the absolute Immanence of Mind in space; 1859 of the absolute Transcendence of Mind in all Being; 1860 I reached the doctrine of the Infinite; 1861, the Origin of the Categories; 1862, the necessity of the origin of all finite being in the thinking of the Absolute; 1863, that the Absolute can be no Becoming, but that becoming and change belong only to His Reflection, or Object.

In 1864 I saw that necessity and change presuppose Freedom as their logical condition; in 1865 that Reality and Potentiality are united in the true actuality (the standpoint of Aristotle); in 1866, the distinction between abstract unity (negative unity, e. g., Force), and concrete unity (e. g., the soul), and the principle of reflection which belongs to the Highest Principle, in such a manner that absolute unity presupposes realization in independent persons (the principle of the Trinity and of the several Christian dogmas, which present in a naive historical form, as mysteries, what really is the deepest of philosophical truth).

In 1867 I commenced *The Journal of Speculative Philosophy;* in April, published a critique of Herbert Spencer's "First Principles"; in 1868 and since have seen, every year, some new application of the principle of the idea discovered in 1866; in 1871 discovered the speculative latitude and longitude of Fichte. I translated in 1865 one-half of Hegel's "History of Philosophy" (three volumes), and have published the parts relating to Aristotle and Plato; have studied his philosophy of history from year to year, always getting new thoughts from him. I am this year finding some great thoughts in the Scholastics, and especially in Thomas Aquinas.

Supplementary to these notes, which so admirably illustrate Mr. Harris's methods of study and his masterful intellect, are other notes concerning Thomas Davidson and others who were making collateral progress in philosophical research. Altogether here we have a story which can scarcely be duplicated in American biographical history. All around St. Louis grew up a remarkable school of speculative thinkers. Here was laid the foundation of the work afterward pursued so honorably at Concord. But all this while the power of speculative thought was doing its work to make a complete balance for the rise of nature studies. Mr. Harris became what might be called the counterbalance of Louis Agassiz, saving the American school system from a headlong drift away from classical studies and history.

It was this conservative element, or, rather, equable power of looking all around a matter, that brought Mr. Harris into collision with very eager reformers. They, often with a grand zeal, were impatient of any delay; so that after a while, finding Harris cool and deliberative, they broke with him, and in some cases denounced him as a reactionist or a stand-patter. The reform was none the less sure for being well prepared for and thoroly discussed before adoption, rather than overhauled and brought into question afterward. In deliberative meetings Harris was fond of listening, and ready to give an ear to all; but in debate he grew eager, strong and penetrating. It was not safe to meet him without very thoro preparation. What made him unpopular with some, and with others did not make him popular, was his ability to use philosophic terms. This ended in his slinging the other fellow over his shoulder while he batted him with Hegel, Plato and Kant, to his tongue and heart's content. It was sometimes as difficult to understand Mr. Harris as he himself found it difficult to grasp the inmost meaning of Hegel. But his sympathies were very simple, so that small children loved him; nor did he fail to give them assistance in all childhood affairs, in a childlike way. He still holds the same simplicity of character and method while still as insistent as ever with his deeper studies. His resignation marks the passing of a whole generation. The new school now in charge of educational affairs is born about one-half of Agassiz and one-half of Harris.

The Santa Fé Rebate Cases

If it be true that the history of the Santa Fé coal rebate case is closed with the statement issued by the Interstate Commerce Commission last week, the final chapter leaves something to be desired. This is the case in which Mr. Paul Morton was said to be involved, and concerning the prosecution of which the President and Attorney-General Moody disagreed quite sharply with ex-Attorney-General Harmon and Mr. Judson, whom the Government had employed as special counsel. We have published elsewhere a part of the Commission's statement. It does not explain why it was necessary that "a long-standing practice intended primarily to develop the coal industry in Colorado and New Mexico," and "which really did have that effect," should involve unlawful discrimination against the

coal mine competitors of the favored Colorado Fuel and Iron Company, discrimination on account of which, the Commission admits, "the coal-mining companies discriminated against in favor of" that company recently recovered "something like a half-million dollars" in damages. We are also told that the objectionable practice "only became conspicuously unlawful after the passage of the Elkins law in 1903." Would the Commission have the public understand that it was not equally unlawful at any other time after the passage of the Interstate Commerce law in 1887? Of course, as the Commission says, it was "not difficult to prosecute the corporations themselves"; but will it assert that either of them, or the public, could regard a fine of $15,000 as a penalty of appreciable weight? One company is capitalized in stock and bonds at $483,000,000 and the other at about $40,000,000. It is difficult to see why the Commission should rejoice to the extent of half a column over the imposition of those small fines, or why a "great meed of praise" is due to it, to Mr. Moody, or to the President for what took place. There was another case, relating to discrimination by the Santa Fé in favor of what was called a Salt Trust, of which Mr. Joy Morton was a prominent officer. What became of it? By the Commission the facts were brought out. If they pointed only to "a practice intended primarily to develop" the salt industry, some reference to them might appropriately have been included in the Commission's statement.

Mr. Jerome

Mr. Jerome will accept the Democratic nomination for Governor of New York, if he can have it with no pledge except that he will be true to his oath of office, and be bound by no obligations to party bosses. And the rulers of the Democratic party are in terror. They cannot do anything with him, and they cannot do anything without him. The Hearst following is in distress, and the old gang, which loves office and runs the party is equally at sea. Tammany is in doubt whom to help, but of all men it does not want the man who has flung his invectives into its wigwam. And the Republicans are equally disturbed. The Republican condition is as bad as it can be. The factions are fighting each other, and the two Senators are unable to suppress the row, while the Congressmen are all in the fight. A united Democracy might capture the State, but not a divided Democracy. Mr. Jerome took his present office by the gift of the independent people, as an independent candidate, with all the regulars against him. The people broke away from their party tickets because they believed him to be a virile, honest man. If the Democrats nominate him he might be elected, for a multitude of Republicans are disgusted. If the Democrats should not see and improve their chance, might he not run again as an independent candidate, and be elected by the people? It is not impossible, for the conditions are peculiar, and it is a time for a courageous independent candidate to attract voters. Let him throw his castor into the ring; but he will find many who trusted him then who now believe he has not kept his promises.

France and the Pope

Pius X has just reprobated the arrangement which France created on the disestablishment of the Church. The Pope brands *les associations cultuelles,* who are simply local trustees holding the church property, because France wishes him to outstrip his authority. Yet for over a generation the same worship associations have existed and now exist in Switzerland. Yet Pius X makes no protest against the Swiss. Furthermore, in some cantons, by force of *les associations cultuelles,* the Swiss Catholics elect their parish priests; yet Pius X protests not. Strange that His Holiness is bowed down with sorrow at the wickedness of the French, who wish the people to hold their property, while he worries not at the greater offensiveness of the Swiss. But has Rome thrown over the French scheme? Apparently; but in point of fact the Pope authorizes the Episcopate to see if some legal arrangement may not be found in order to keep up the *status quo.* In a word, the Vatican leaves the matter to the hierarchy of France. Now the bishops have till De-

cember 11th to arrange or find the legal way out. Be sure of it the Monseigneurs will find the *associations cultuelles* the best means at hand; for they thus will enjoy the use of the churches and other Government buildings and draw salaries for the next four or five years. But how about Pius X's encyclical? How about, we may ask, Leo XIII's encyclical condemning the Irish Land League, or the other branding Americanism? Let us wait.

We do not care to take any part in the rivalry of the two sections for control of public sentiment among the educated negroes of this country. With every word of the principles enunciated at the meeting held last week at Harper's Ferry we agree. They speak for the "Niagara movement" as led by Professor DuBois, and they ask with no compromise for all equal social rights. The other wing is led by Dr. Booker Washington, and is devoted to manual education and the acquisition of land and wealth as the speediest means of racial betterment. For their teaching there is also room, and it has its place. In both factions, if we may call them such, there is much real principle involved and much personal interest and ambition. We heartily wish they could come together, as they agreed to do at their meeting in Carnegie Hall two or three years ago.

The larger part of our colonial and international troubles comes out of that self-conceit and brutal arrogance which sees no equal merit in other people. The Spanish had their share of it in the late war when they pictured us as pigs to be stuck. We suffer from the same disease in Porto Rico and the Philippines. But it is a new illustration and a mischievous one that appears in Hawaii. There the Japanese—and they are not to be trifled with—complain of indignities by the Americans, and ask for the protection of Japanese war vessels. But the folly which thus expresses its arrogance is incurable, and the country suffers for it.

With great frankness General Kuropatkin has discussed the causes of the Russian failure in the late war. When all is boiled down it comes to this, that the common soldiers had "no enthusiasm to fight" and "no will to conquer," and that, in general, "there was not a sufficient number of officers of all grades with the nerve and spirit capable of enduring the fatigues of a conflict lasting over several days." "We are poor," he says, "in men distinguished by their independence, energy and initiative." That is enough. What else could be expected but failure with an uneducated, inert rank and file?

While Great Britain is trying to find a way to end its experiment with the Chinese in the South African mines, the Panama Canal Commission is telling us that we can never dig the canal with white laborers or black, but only with yellow; and they want the Chinese coolies permitted to land with no regard to any exclusion laws or sentiment. It sounds like a made-up case against the present force of workmen, such as the French found satisfactory enough.

If, as reported, Dowie and Voliva have made up, and will agree that Dr. Dowie shall be Elijah, or Prophet, or anything else in the spiritual line which his vanity requires, while Voliva is to run the business departments and hold the purse-string, we may have peace in the Zion City, but the world will smile, altho the gift of humor does not seem to belong to those curious people. The augurs could smile, but they are yet too serious.

A new chapter was added the other day to the history of the boundary disputes of the States of Connecticut and Massachusetts when it was found that Massachusetts saloonkeepers had moved the boundary stones from ten to sixty feet, so as to put their saloons into the jurisdiction of Connecticut, and so escape the Massachusetts taxes. Think of the audacity of stealing the State itself!

If a community crazed with fear does not want soldiers in its neighborhood, then let them be removed. Such a condition is dangerous on both sides, exaggerated and unreasonable as the fear may be. We are not displeased that the War Department has ordered the regiment from panicstricken Brownsville to Fort Ringgold.

Insurance

The Valparaiso Earthquake and the Insurance Losses in Chile

The enormous destruction both in life and property that took place last week at Valparaiso, the chief port of our Southern American hemisphere, and thruout Chile, following so closely upon the very recent San Francisco earthquake disaster, cannot but provoke remarks and excite universal sympathy. From an insurance point of view it is fortunate that American fire insurance companies will suffer no loss in Valparaiso as a result of the earthquake. Because of laws governing foreign insurance companies, which American insurance companies have considered unfavorable for operations in Chile, they have not written policies there. The insurance companies of this country consequently escape losses which if added to those recently suffered in California must have been exceedingly crushing. Twenty-one fire insurance companies have been operating in Chile. Ostensibly these are all domestic corporations, but in reality they represent for the most part English capital. These companies have a paid-up capital that aggregates about 4,000,000 pesos or approximately $1,750,000. The following list, containing the dates of founding, details as to capital, etc., compiled by *The Journal of Commerce,* tabulating the names of the companies organized in Chile to do a fire and marine business, will be found interesting at the present time:

	Founded.	Subscribed Capital, Pesos.	Paid-up Capital, Pesos.
Alemana, Santiago...	1900	2,000,000	200,000
America, Valparaiso..	1861	2,000,000	200,000
Central, Valparaiso...	1900	2,000,000	200,000
Chilena, Valparaiso...	1853	2,000,000	200,000
Christoforo, Iquique..	1892	1,000,000	100,000
Commercial, Valparaiso	1899	2,000,000	100,000
Espanola, Valparaiso.	1898	2,000,000	100,000
Estrella de Chile, Santiago	1894	2,000,000	100,000
Francesa, Santiago...	1899	2,000,000	200,000
Iberia, Valparaiso....	1900	2,000,000	230,000
Internacional, Valparaiso	1901	5,000,000	500,000
Italia, Valparaiso.....	1899	2,500,000	250,000
Mitua, Iquique.....	1894	1,289,600	64,480
Nacional, Valparaiso.	1883	2,000,000	125,000
Nueva Espana.....	1900	2,000,000	200,000
Pacifico, Valparaiso..	1886	3,300,000	300,000
Protectora, Valparaiso	1885	2,000,000	100,000
Salvadora, Santiago..	1902	1,000,000	100,000
Salitrera, Iquique....	1901	1,000,000	100,000
Union Chilena, Santiago	1858	2,000,000	200,000
Valparaiso, Valparaiso	1882	2,000,000	200,000

In addition to the companies named certain German companies, together with one or more Spanish companies, have written business in Chile.

Advancing Fire Insurance Rates

A RECENT communication from the manager of the Royal Insurance Company to his Pacific Coast agents bears upon the general subject of advanced rates, lately agitated with much persistency. This communication says:

"The purpose of this note is to assure you that an advance in rates on the coast and thruout the United States and the world is absolutely necessary. Quite a number of companies, including our own, due to wise provision against such emergencies, are fully prepared to meet their San Francisco losses, and will have left funds enough for other similar disasters, but the San Francisco claims, when paid, will have exhausted the surplus, and in some cases the capital as well, of a great many companies.

"But for the accumulation of large reserves against disasters, concerning which there has been much public criticism, few of the companies now able to continue in business, and to offer protection to merchants and manufacturers, could have survived. It is of the utmost importance to the commercial world that these reserves should be restored, and they can only be restored by contributions from the many in the way of advanced rates. If ratepayers generally are long-headed they will, for their own protection, be glad to contribute at least for a year or two to the rebuilding of insurance reserves, which are so necessary to the conservatism of the business interests of the country. The stability of the commercial supremacy of the United States is more largely dependent upon the security offered by fire insurance than most people conceive; hence it is the greatest importance that this security should be above criticism or question.

"Advanced rates are absolutely necessary—not for the profit of the companies, but for the safety of the insured. At the earliest possible date, when the San Francisco losses have been adjusted and paid and normal conditions have returned, all of the cities and towns will be re-rated upon revised schedules, taking into account the particular conditions existing at each point. Rate advances are being agreed to thruout the whole country."

According to the *Argonaut,* La Belle Otero, the most famous dancer in Paris, has insured her ankles against sprain for $80,000 each.

Financial

The Pacific Dividends

SPECULATION in securities on the Stock Exchange has been greatly stimulated since Thursday, the 16th, by the declaration of unexpectedly large dividends on the common stock of the Union Pacific and Southern Pacific railways. A few minutes after the opening of the Exchange on Friday it was announced that by a semi-annual dividend of 5 per cent. the annual rate on Union Pacific had been increased from 6 per cent. to 10 per cent., and that in the payment of dividends on Southern Pacific common a beginning had been made (with a semi-annual distribution of 2½ per cent.) by making the annual rate 5 per cent. Those who had sold for a decline hastened to cover; speculative pools increased their holdings; traders bought for the advance; and the day's transactions amounted to more than 2,500,000 shares. Prices for Union Pacific and Southern Pacific rose 17 and 7 points, respectively. On following days the speculation became even more active; Saturday's two hours saw the sale of 1,663,000 shares, and the number on Monday was 2,836,000. At the highest quotations of Monday, the advance from the low point of last week was about 28 points for Union Pacific and 14½ for Southern Pacific; but since the meeting of the board on July 19th (when the question of dividends was referred to the executive committee) there has been a steady rise, amounting in one case to 41 points and in the other to 23. In the advance of the last few days the entire market shared.

The directors (and especially President Harriman) have been criticised by some because the announcement appears to have been withheld for a short time, and also because so large an increase is regarded as inconsistent with a prudent and conservative policy. The executive committee reported on Wednesday, and final action was taken by the board on Thursday afternoon. It is alleged that men prominent in the management were interested in very large speculative pools and have gained enormous profits. Not more than a 7 per cent. rate was generally expected for Union Pacific, and not more than a 4 per cent. rate for Southern Pacific. Hostile criticism comes mainly, of course, from speculative interests that were caught on the wrong side of the market. Of the published story that Mr. Harriman's gains are $10,000,000 there is no proof whatever, nor is any evidence brought forward in support of assertions that other directors have taken large profits. It is admitted that the increased dividends have been earned, but what is regarded as an official assurance that the high rates can easily be maintained does not seem strictly in accord with a wise conservatism. It is quite evident that by their action the directors have made enemies, and it is probable that these enemies will direct attention to the fact that the great increase of earnings has been due in part to a combination of parallel lines, a combination resembling that which the Government dissolved by the Northern Securities suit. They may also ask the Commission to inquire whether a dividend of 10 per cent. does not indicate that combination has enabled the companies to exact freight rates so high that they ought to be reduced.

....The Title Guarantee and Trust Company, of which Clarence H. Kelsey is president, has just issued a statement showing that its capital is $4,375,000, its surplus and undivided profits amount to $7,014,749, and its total resources are $47,943,769.

....James R. Plum, director in the Fifth Avenue National Bank and in the United States Life Insurance Company and treasurer of the United States Leather Company, has been elected vice-president of the Importers and Traders' Bank to fill the position occupied so many years by the late Russell Sage. The Importers and Traders' Bank has a capital stock of $1,500,000 and surplus and undivided profits of more than $7,000,000. Edward Townsend is president.

....Dividends and coupons announced:

Atch., Top. & S. F. R'way (Eastern Okla. Div.), coupons payable September 1st.

Buffalo & Susq. R. R. Co. (Preferred; quarterly), 1 per cent., payable September 1st.

Lord & Taylor (Preferred; semi-annual), 3 per cent., payable September 1st.

U. S. Leather Co. (Preferred), $1.50 per share, payable October 1st.

The Independent

VOL. LXI NEW YORK, THURSDAY, AUGUST 30, 1906 No. 3013

Survey of the World

The Oil Trust Again Indicted

A very long indictment against the Standard Oil Company was reported by the Federal grand jury at Jamestown, N. Y., on the 24th, together with one against the New York Central Railroad Company. In the first of these there are 126 counts, each alleging the reception of an unlawful concession in rates during the year 1904 from the New York Central, Pennsylvania and Vermont Central railroads on shipments of oil from Olean, N. Y., to Burlington, Vt. The unlawful low rate was about 15 cents per hundred pounds. At the same time the independent competitors of the Standard, it is alleged, were required to pay 33 cents on shipments from Bradford, Pa., and other neighboring towns, to Burlington. The New York Central is indicted for the rate on a part of this entire route, the Pennsylvania having already been indicted for violation of the law on the remaining part with respect to shipments to Rutland. In the indictment, the charge against the Central is that it failed to file the low rate with the Commission.——At Chicago, on the 27th, ten additional indictments against the Standard Oil Company were returned by the special grand jury which for some time past has been inquiring as to freight rates on oil. In these indictments there are 6,428 counts, each relating to the shipment of a car-load of oil from the refineries at Whiting, Ind. If the company should be convicted upon all the counts, the law would permit the imposition of fines amounting to $128,560,000. It is charged that the company received secret and unlawful concessions from the Burlington, Alton, Illinois Central, Lake Shore and other railroads. For example, altho the published rate from Whiting to East St. Louis was 18 cents per hundred pounds, the secret rate for the Standard's oil was only 6 cents. The railroad companies that violated the law were not indicted.——A criminal action against the president of one ice company and the secretary of another, in Kansas City, has been begun by the county prosecutor. They are charged with conspiring to restrict the supply of ice and to raise the price of it. The prosecutor relies in part upon evidence brought out in a suit to oust the companies from the State for violation of the Anti-Trust law.——In New York, the ice question is still before the grand jury, which is divided, a minority being in favor of reporting indictments. One member of the minority, whose name is not published, asserts that the majority are rich men, who might object to a Trust combination affecting the price of automobiles, but are not interested in an ice combination's exaction of high prices from the poor. Another, Mr. Hillyer, "as a citizen," and without revealing the secrets of the grand jury, gives to the press a statement which shows that he regards the evidence as ample for an indictment. He urges that a petit jury should be allowed to say to what extent the conspiracy (of which, to his mind, there is proof) is of a criminal character.——The Corn Products Refining Company, which, as we said last week, has been constrained by the prosecutions in Philadelphia to discontinue the use of sulfur dioxide in the manufacture of glucose, has now assumed responsibility with respect to the cases of all the manufacturers of candy and of the

retail dealers who were arrested upon the complaints of the State Dairy and Food Commission. More than 400 cases are pending in Philadelphia and other cities of the State. The fines to be paid by the Corn Products Company will exceed $25,000.

The New Railroad Law

The new Railroad Rate law went into effect on the 28th. A meeting of officers of the roads "operating to and from the territory south of the Potomac and Ohio rivers and east of the Mississippi" was held in New York on July 27th, and questions relating to the new statute were referred to a law committee composed of the general counsel of the companies. This committee held its sessions at Atlantic City, and reported its opinions on the 22d inst., together with a resolution which said:

"We commend this law to the fair and loyal observance of the carriers, in a spirit of full and frank recognition of its spirit and purpose."

Whereupon the officers who received the report adopted a resolution thanking the committee and closing as follows:

"Aided by the advice contained in the report, the executive and traffic officials here present will in the administration of the properties confided to their management, use their best endeavors to comply to the fullest extent with all the provisions of the Act."

Owing to the fact that the interests, direct or indirect, of the Reading road in the coal business are larger than those of any other railroad company, the attention of the public has been drawn to the opinions of President George F. Baer concerning that part of the law designed to prevent railroads from owning coal mines by forbidding them to transport their own coal across State lines. Mr. Baer returned from Europe last Saturday. Having said that he had studied the law during his absence, and that the more he studied it the less he seemed to know about its meaning, he continued as follows:

"Am I going to be guided by the section regarding railroads being interested in industries along their lines and dependent upon such roads for transportation? Why, if any one can solve for me the puzzling terms of the bill and assure me it is constitutional, I could answer the question better. Certainly I do not expect the bill to make any change in the methods of the Reading in doing business. We shall go ahead just as we are. If we are right, we are right, if we are wrong, we are wrong; but I cannot see that the Rate bill throws any light upon the question. If any one has succeeded in finding out what it does mean, I have not, at least. The Reading is operated strictly under the terms of its charter. I cannot see where the Rate bill, which goes into effect next week, changes them. It will be time for the railroad to say what it will do when any one attempts to interfere with the methods of business which we believe are right and lawful."

It is reported that Professor Adams, whom the Commission has employed to devise uniform methods of keeping the companies' books and other records, will also undertake to ascertain the actual value of all the companies' property. Senator La Follette urged, but in vain, that the new law should expressly provide for such a valuation.——It is pointed out that the new law permits railroad companies to grant free transportation to the officers and the hundreds of traveling agents of the Standard Oil Company. Any corporation owning oil pipe lines is made a common carrier, and railroad companies are allowed to give passes to "the officers, agents and employees of common carriers."

Political Topics

At the Democratic primary elections in Georgia, on the 22d, Hoke Smith was nominated for Governor by a very large majority, carrying 115 out of the 145 counties. His leading opponent, Clark Howell, was successful in only 10 counties. The renomination of Senator Bacon was not opposed. Disfranchisement of the negro by a law similar to those enacted in six other Southern States is foreshadowed, it is said, by Mr. Smith's' victory, altho the negro vote in Georgia is now very small, owing partly to the tax qualification. There are only 4 Republicans in a Legislature of 218 members. In the campaign, Mr. Smith stood for the disfranchisement of negroes and for a reduction of railroad rates.——At the recent Republican primaries in Tucson and Hila counties, Arizona, joint Statehood was opposed by a majority of nearly two to one.——In the Illinois Democratic convention, Judge Owen Thompson and other friends of Mr. Bryan demanded that Roger C. Sullivan be required to resign the office of member of the Na-

tional Committee for that State. In letters recently published this demand was emphatically made by Mr. Bryan himself. By a vote of 1,038 to 570 the convention sustained Mr. Sullivan and then with considerable enthusiasm passed a resolution nominating Mr. Bryan for the Presidency, altho the latter recently said that such indorsement would not be acceptable if Mr. Sullivan should not be ousted. The platform denounces Congress for its "surrender to the Meat Trust, the railroads, and the Standard Oil Company."——The Republicans of Nebraska have nominated Attorney General Norris Brown for Senator. They ask that Senators be nominated by direct primaries. In Ohio, the Democrats favor the direct election of Senators, preferring the Oregon plan. Their platform also calls for the initiative and referendum, and for a tax on the value of franchises.——In Massachusetts, Henry M. Whitney is no longer a candidate for Governor on the Democratic side. It appears that he had been informed that ex-Governor Douglas would not stand again, and that no other prominent Democrat (except District Attorney Moran) cared for the nomination. He afterward learned, as he says, that his candidacy did not command Mr. Douglas's support, and that the latter was not unwilling to be nominated. Therefore he promptly withdrew, saying that Mr. Douglas was the logical and inevitable candidate.——There are signs that many Republicans in Iowa will vote against Governor Cummins in November. Pledges hostile to him are in circulation and are said to have been signed by a considerable number of voters.

Progress of the Rebellion in Cuba

The rebellion in Cuba, which began on the 19th, when many prominent men were arrested and the presence of armed bands of insurgents in the provinces of Havana and Pinar del Rio became known, has assumed formidable proportions. It is in Pinar del Rio, at the eastern end of the island, that the largest number of organized insurgents are to be found at present. This province has had a Liberal majority, but all its municipal and provincial offices have recently been held by Moderates, some of them having been obtained by appointment, and others by the elections of last year, in which the Liberals did not participate. This being the idle season in the tobacco and sugar industries, thousands of laborers there are free to engage in adventurous undertakings. The rebel commander in the province is Congressman Faustino (or Pino) Guerra, who has about 1,500 well armed men and plenty of money. On the 22d he took possession of San Luis, a city of 4,000 people, ten miles from the capital of the province, and on the following day he captured San Juan de Martinez. A day or two later he withdrew from both towns. His purpose is to get possession of the city of Pinar del Rio, to which the Government has sent several hundred Rural Guards and fresh recruits. In the engagements which have thus far taken place in the province, a few persons have been killed. A considerable number of the Guards surrendered or deserted to the enemy. Guerra threatened to blow up the bridges on the Western Railway if the company should continue to bring reinforcements to Pinar, but at last reports the road had not been disturbed. The presence of a small band of rebels in Matanzas is reported. In Santa Clara there were several groups, and a majority of the insurgents there appear to have been led by ex-Congressman Carlos Mendieta. He was arrested on the 26th, after his followers had been dispersed. In Las Cruces, the Mayor, the police, nearly all of the local officers and the Rural Guards stationed there, have become insurgents. Similar action was taken in Aguacate. Palmira, near Cienfuegos, was occupied by insurgents under Colonel Guzman, who at once received the support of the mayor and the town council. The eastern end of the island is reported to be quiet. There are several small bands of rebels near the city of Havana. One of these was led by General Quintin Bandera, a negro soldier who gained fame in the revolution, but had in recent years sought in vain for office. Bandera was killed by the Guards on the 23d, at a point fifteen miles from the city. His body was placed in the morgue at Havana, and President Palma let it be known that the funeral

expenses would be borne by himself. On the 25th, seventy insurgents occupied the village of Arroyo Naranjo, only five miles from the city, but were soon driven away. Bejucal, also near the city, was held by insurgents for a time on the 26th. General José Miguel Gomez, formerly the Liberal candidate for the Presidency. was arrested at his home on the 22d, and has been indicted. He denies that he had any knowledge of the insurrection. Señor O'Farrill, Secretary of State and Justice, and acting Secretary of the Interior, withdrew from the Cabinet for reasons not clearly disclosed, but was induced to return.——Colonel Valle, with a force of guards and volunteers, attacked Colonel Guzman's band of insurgents near Cienfuegos, on the 27th, killing seventeen of them and losing but one man.

President Palma's Statement

Guerra and other insurgent leaders in the field say that their movement is a protest against violations of the Constitution by the President and his associates. Thus they refer to the recent national election and to the Executive action which preceded it. They demand that this election be annulled. Their representatives in New York suggest that President Roosevelt should make an investigation or should provide for a new election under the direction of a commission. Senator Zayas, now leader of the Liberal party, says that the party opposes any resort to arms as a protest against the methods which were successful at the election.——On the 27th there was issued by the Government a proclamation of amnesty. All insurgents who lay down their arms will be permitted to go to their homes. The Government promises that it will not molest them hereafter if they remain peaceful and obey the laws. Decision as to those now in prison is reserved.——On the same day President Palma gave to the public a statement. The insurrection, he said, had no ideals and no program, but was only a crazy movement on the part of discontented persons. There was no moral reason for it. The Government in the treatment of it desired to avoid excesses; it would entertain no feeling of rancor toward those who should return to their senses and abandon the cause of disorder. But the Government, he continued, would not compromise with the insurgents in any way. It was legitimately constituted and was bound to demonstrate its stability and its power to protect life and property. Compromise would sow the seed of revolution, and cause insurrections in years to come. The stability of Cuban institutions would be guaranteed by a prompt suppression of the insurgents. There must be no compromise. "This," said he, "is my firm resolution, and I shall maintain it even at the cost of my life. I understand my duties and responsibility. Such is the only method of defending Cuban institutions and civilization." Having referred to his own sacrifices, labors and sufferings during the long fight for independence, he added:

"Poor, I returned to my country as President, and poor shall I return to private life. I shall, however, have a clear record and a good name. I am disposed to exhaust my forces, and to shed my blood, if necessary, in helping to strengthen the foundations of our prosperous republic."

——It was asserted on the night of the 27th by Senator Dolz, at the conclusion of a conference with President Palma, that practically all of the insurgent leaders, Pino Guerra excepted, had signified their willingness to disband their forces in response to the offer of amnesty.

The Ruin of Valparaiso

Later reports of the Chilean earthquake indicate that the disaster was even greater than was at first thought. The total loss from fire and earthquake is estimated at $200,000,000 or $250,000,000. Nearly a thousand dead have been found and it is feared that as many more may be yet in the ruins. A quarter of the city was destroyed by the earthquake and another quarter by fire. All of the theaters, hospitals and churches, except the church of Espiritu Santo, were demolished. The first shock lasted four minutes and the second and more severe lasted two minutes. Tremors have been frequent ever since, adding greatly to the alarm of the people, but doing no further damage worth consideration. The earthquake was not perceptible in Panama. There have been unusual earthquake

shocks felt in England, Germany and Italy during the week. The Chilean Government has appropriated $4,000,000 as a relief fund. President Roosevelt has issued a proclamation calling for contributions to the Red Cross Association, and subscriptions have been raised in all the principal cities. San Francisco telegraphed $35,000 and Los Angeles $10,000. It is generally expected that the city will be rebuilt on the present site and on an improved plan, as there are many wealthy citizens, and the foreign steamship lines have confidence in its future as a commercial port. The business portion suffered least of all. There will be great difficulty in obtaining lumber for rebuilding, as the San Francisco disaster has reduced the supply on the Pacific Coast and the price is high. Three thousand of the people of Valparaiso have taken refuge in Santiago, but there are many thousand still camping in the hills, altho the rains are heavy. The marines from the Chilean fleet are keeping order, shooting looters and supervising the sale of bread and meat, to prevent extortionate prices. Several thousand workmen are engaged in clearing away the ruins and searching for bodies. A child, alive and unharmed, was found in a barrel in a ruined house eight days after the earthquake.

The Close of the Pan-American Conference

The last session of the Pan-American Conference at Rio de Janeiro was held on the evening of August 27th. Baron de Rio Branca, the Brazilian Minister of Foreign Affairs, delivered the farewell address, and congratulated the delegates upon their successful and harmonious labors. Señor Riquelme, of Chile, read a telegram of thanks from President Riesco, extending the thanks of Chile for the sympathy and assistance received from the American republics on the occasion of the Valparaiso earthquake. Banquets given by the Brazilian Minister of Foreign Affairs and by the American delegates and other festivities marked the close of the Conference. During the last days of the session the Conference disposed of the projects of sanitation, commercial relations, patents and copyrights, Pan-American railway and the codification of international law. The Conference adopted the resolution presented by Mr. Buchanan, the head of the American delegation, providing that the countries represented in the Conference shall prepare statistical tables showing the monetary fluctuations of the past twenty years for submission to the next Conference. The purpose of this is to show the harm done to commercial interests by such fluctuations in exchange and the advantages of a universal gold basis. The Drago Doctrine opposing the use of force against the foreign Power for the collection of debts was referred unanimously to the Hague Tribunal. The resolution of reference says that the principle in question, as affecting the international sovereignty and rights of nations, should be passed upon by an assembly composed of the representatives of all the nations. The Conference, being composed exclusively of American delegates, did not think it justified in deciding upon such an important question, and accordingly referred it to The Hague in these words:

"That the governments represented in this conference consider the point of inviting the second conference of The Hague Tribunal to consider the question of the compulsory collection of public debts, and, in general, means tending to diminish, between nations conflicts having an exclusively pecuniary origin."

Secretary Root's plans have been somewhat disarranged by the great Chilean earthquake. He will meet the Chilean Minister of Foreign Affairs at Lota, 300 miles south of Valparaiso, but at the request of Secretary Root the formal reception and public celebrations will be omitted in order that the money may be spent for the relief of the earthquake sufferers. The shortening of Mr. Root's stay in Chile will give him a week or more at Panama on his return across the Isthmus, and thus afford him opportunity to become thoroly acquainted with conditions there.

Cretan Reforms

The new *régime* planned by the four Powers which control Crete postpones indefinitely the union of the Island with Greece, which has been the aspiration of a large proportion of its population. When, in 1898, Prince George of Greece was made High Commissioner of Crete, it was

generally expected that this was only a temporary arrangement transitional to annexation. Prince George has exerted himself, sometimes too zealously, to Hellenize the Island, and has twice made a tour of the capitals of Russia, England, Italy and France, to persuade these Powers to permit annexation. At times the same demand has been emphasized by local insurrections of the Hellenistic Cretans. But the insurrections were put down by the troops and ships of the allied Powers, and the petition of the High Commissioner denied. Now Prince George has resigned, and his place is taken by Mr. Zaimis, who was Prime Minister of Greece in 1901, but more recently leader of the Opposition in the Greek Chamber. The measures adopted by the four Powers tend rather in the direction of autonomy than annexation. The Powers promise to withdraw the international troops as soon as a Cretan gendarmerie and militia are formed and order is restored, and the safety of the Mussulman population is assured. Greek officers may serve on these forces, but must resign from the Greek army. It is evident that under these stipulations it may be some time before the troops of the controlling Powers are withdrawn. But the arrangement of having soldiers of four different nationalities to keep order in the Island has not been altogether happy, for jealousy and conflicts of authority have been rife. When the relations between France and Italy were strained, the Italian soldiers would mutter "Sedan!" when the French troops marched past, and the French would retort "Menelik!" The Consuls-General of the four Powers will, under the new *régime*, as under the old, watch over the conduct of affairs, but it is recommended that they consult the responsible advisers in all ordinary matters, in order to enhance their administrative authority. The payment of the interest and principal of the loan of $800,000 advanced by the Powers is postponed till 1911, and a new loan of $1,860,000 is authorized, to be devoted to indemnities and public works. Equal rights are insured to the Turkish inhabitants, who have been badly treated in the past and have left the Island in large numbers in fear of annexation. The Mussulmans were so elated over the decision of the Powers that they raised the Turkish flag in their cemetery at Canea, the only public place remaining to them in the Island, but this act so excited the Christians that English troops hauled down the flag to prevent disorder.

Terrorism in Russia

The fighting wing of the revolutionary party, known as the Maximists, have been extremely active during the past week in their war against the autocracy by means of assassinations. An elaborate but unsuccessful attempt was made upon the person of Premier Stolypin, August 25th, during a public reception at his country home on Aptekarsky Island. The rooms were filled with distinguished officers and guests when a handsome landau drove up containing two men in the uniform of officers of gendarmes and one in civilian clothing, and one as coachman. The officers descended from the carriage, and, laughing and chatting, carried ostentatiously into the hall a large gilded vase which concealed a bomb of an unusually destructive character. This was exploded in the anteroom, probably because the bearers were refused admission into the reception rooms. The report was as loud as that of a cannon. The front wall of the villa was torn out, the partition demolished and the upper story brought down in ruins to the ground. Thirty-two persons were killed and thirty-three injured. The Premier had just stepped into his study for a moment and so escaped injury, altho he was slightly wounded in the face and neck by flying splinters. Two of his children, who were in the upper rooms, were seriously injured by the falling of the house. His only son, three years old, was badly hurt, and his fifteen-year-old daughter, whose legs were crushed, was at first reported dead and is not yet out of danger. It was over an hour before medical aid could be secured, and the wounded were not released from the ruins of the building until night. Human limbs and fragments of torn flesh were scattered far over the lawn and up in the branches of the trees. Crowds gathered of all classes to view the scene and secure souvenirs. Two of the assassins fell victims to the explosion. The other two, one of whom

was wounded, were arrested, but are not yet identified. The attack on the life of Premier Stolypin is regarded as reprehensible and impolitic even by many of the revolutionary socialists. On the following evening General Min, commander of the Seminovsky Guard Regiment and an adjutant in the suite of the Emperor, was killed on the station platform at Peterhof by a young woman, who fired five shots from an automatic revolver. He was returning from the capital to his summer residence at Peterhof and had just greeted his wife and daughter when he was shot from behind. Madame Min seized the assassin, who did not attempt to escape, but warned her not to hit the hand-bag which she carried because it contained a bomb. General Min had long before been condemned to death by the terrorists for ordering the soldiers to fire upon the students of the Technological Institute at St. Petersburg last October 31st, when it was reported that he desired to set the building afire in order to burn alive the students inside. In Odessa a girl of seventeen again attempted the assassination of Governor-General Kaulbars, but, as before, the bomb was accidentally dropped and exploded, injuring no one except the girl, whose hand was shattered. General Trepoff, the head of the Russian police system, is seriously ill and it is rumored that it is due to an attempt on the part of his cook to poison him. General Von Liarliarski, Acting Military Governor of Warsaw, was shot and killed while driving in a cab in that city. The assassin escaped. Emperor Nicholas and the Empress left the Peterhof palace to attend the funeral of General Min in the military camp.

Russian Lands and Finances

Premier Stolypin, notwithstanding the attack upon himself and his family, will continue in office, and the Government's plans for the benefit of the peasants were announced without delay. The Crown appanage lands to the extent of 4,500,000 acres have been transferred by imperial ukase to the Peasants' Bank for distribution to the peasants. These lands include those under cultivation which are not contiguous to forest tracts, and where leases have expired, and the forests surrounding and adjoining the peasants' holdings. The sites of the factories, mines and valuable buildings, lands unsuited for farming and the Crown lands in the Crimea and Trans-Caucasia are excluded. The method adopted for the distribution of the land will be similar to that used when the serfs were freed. The Emperor and other landowners will receive land script redeemable by the peasants in instalment notes. Part of the script will bear 6 per cent. interest, but will not be marketable for five years. The rest will be paid in 5 per cent. debentures, payable to bearer. This is to prevent flooding the market with paper money. It is not yet decided as to whether the payment shall be completed in thirty-three years or sixty years. Ten million acres more of Crown lands will be later sold to the peasants with the object of breaking up the peasants' communes by endowing them with private property. Finance Minister Kokovsoff in a recent interview states that the Government has ample funds in sight to tide over the present year. The $25,000,000 loan for famine relief will be taken by the Government Savings Bank. The Minister says that the excess of the revenue over the estimate for the current year will be $100,000,000, which would be more than enough for the extraordinary expenses in connection with the suppression of the revolution, which, directly or indirectly, has cost in the neighborhood of $5,000,000 a month. No foreign loan will be asked for until after the meeting of the new Duma. The Viborg manifesto, in which the members of the former Duma advised the peasants to refuse to pay taxes, will not affect the national revenues, for the direct taxes are paid by the peasantry only for Zemstvo and local purposes. The central Government gets its revenue from the peasantry only indirectly, as from the monopoly from the sale of alcoholic liquors, and the revenue from this source, instead of decreasing, increased $17,500,000 in the first six months of the year. Mr. Kokovsoff, therefore, concludes that there is nothing alarming in the financial situation. The Paris *Temps* published a story that John D. Rockefeller was to advance Russia $100,000,000 in exchange for a Government conces-

sion for the proposed canal between the Baltic and Black seas. This report has been officially denied.

The Opening of Manchuria

The delay of the Japanese in opening Dalny, the commercial seaport of the Liao-Tung peninsula, near Port Arthur, to the trade of the world has caused a great deal of dissatisfaction among the nations interested in Manchurian commerce. It was felt that the Japanese were profiting by the delay to secure a hold on the country which would render its ultimate formal opening of no avail. This question can now be decided by experience, for the Japanese Government announces that Dalny will be opened September 1st as a free port. In defense of their action in not subjecting goods entering Dalny to the regular Chinese tariff the Japanese call attention to the fact that the treaty between Russia and China permits goods to enter China from the Russian frontier on payment of only two-thirds the duties imposed on articles imported thru the open ports on the coast of China. It would not, they claim, be fair to close the front door of Manchuria to maritime nations while the back door remained open. The present arrangement will still be greatly to the advantage of the Japanese, whose goods will come thru Dalny duty free, while the British and American commerce, which goes normally by the way of Niuchwang, will have to pay duties. The Japanese will permit the ships of all nations to engage in the carrying trade between Dalny and the various open ports of Japan. The other ports of Manchuria which American diplomacy opened to the commerce of the world by the treaty of October 8th, 1903, do not seem to be yet "open" in the ordinary sense of the word. For example, Mukden, the capital of Manchuria, is one of the ports thus opened, but the Chinese now hold that the provision in the treaty that suitable tracts of land be set aside for international use and occupation, does not mean that these tracts be located inside the cities. The trade of foreign nations would, according to this, be restricted to an unoccupied area outside the walls of Mukden and the ordinary Chinese duties be levied on goods as they entered the city. Another of the ports opened by our treaty was Antung, on the Yalu River of the Korean frontier. But here the Japanese have during their military occupation appropriated for a nominal payment the river frontage for several miles and all the land outside the native city available for foreign settlement. The railroad from Mukden to Antung is still a military line, but will be converted to a standard gage within two years and connected with the Korean line by a high bridge across the Yalu River. The Chinese Eastern Railroad has been reconstructed for a distance of nearly 400 miles from Port Arthur, and only 35 miles remain to be built before it will connect with the Russian line from the north. Mukden is already connected to Pekin by rail.

China May Have a Parliament

The commissioners sent by the Dowager Empress around the world to study the institutions of foreign nations with a view to the reorganization of China have returned, and agree in recommending a series of gradual reforms. A committee consisting of Prince Chun, Viceroy Yuan Shih-Kai, the Ministers of the Grand Council, and the Grand Secretaries and Ministers of State, has been appointed by the Dowager Empress to consider their recommendations and to devise a plan for a national legislative assembly. It is proposed to organize first an upper house, composed of Government officials, to be followed in the course of a few years by the election of a lower house. The expenses of the Chinese Government are increasing rapidly owing to the assumption of the railroad concessions granted to foreign Powers and other undertakings resulting from the Nationalist movement. At the same time the revenues are falling off. The customs receipts have decreased 10 per cent. since last year. The revenue from the opium tax has also declined, owing in part to the activity of the Chinese prohibition societies for the abolition of opium smoking and the suppression of the trade. The Dowager Empress has issued a long edict calling attention to the sufferings of the people from drought and excessive taxation, and exhorting officials to a more rigid economy.

The Path to Peace

BY WILLIAM J. BRYAN

[The following is the substance of an interview with Mr. Bryan, which was kindly granted me by him at the request of THE INDEPENDENT, during the London Peace Conference.—HAYNE DAVIS.]

MR. BRYAN remarked:

"This conference at London was called especially to consider the plan of campaign, proposed at Brussels last year by the Americans, for a determined war on war.

"It was composed exclusively of men who can be regarded as representatives of the idea of Parliamentary government, because every member of the Conference had been elected to a seat in the National Parliament of his own country.

"The Conference took place in the historic hall of Westminster Palace called the Royal Gallery, because it is the part of the Palace which is reserved for the

Sovereign when visiting the Parliament in person. On opposite sides of this historic hall hang the famous paintings by Maclise, portraying the victories of Nelson at Trafalgar and of Wellington at Waterloo.

"On July 23d these portraits were looking down upon one of the largest, if not the very largest, body of national lawmakers ever assembled together in an International Conference. The two commissions, composed of twelve of the most eminent members of the Interparliamentary Union, appointed at Brussels, had filed their reports. The second Hague Conference, called in accordance with the resolution of this Union adopted at St. Louis in 1904, was in sight. The hour had come for deciding upon the ideas which this union of lawmakers regards as best calculated to open the path to peace, and as most worthy of the consideration of the forthcoming Hague Conference.

"While in Norway I had received an invitation from Lord Weardale, the president of the British group, to participate in the deliberations of this Conference. For two years I have availed myself of various opportunities to advocate an investigation of every international controversy by an impartial tribunal, prior to the commencement of hostilities; and I was glad of an opportunity to present this idea to such a large body of eminent statesmen. So I came to London in order to make a motion in favor of such a declaration by this Interparliamentary Conference. Upon my arrival I stated my wish to Lord Weardale and to Mr. Cremer, the president and the honorable secretary of the British group. They were kind enough to have my motion to this effect placed on the calendar of the Executive Committee of the Union, so that it came up for consideration at the first meeting. When the matter came up in this committee, I learned, for the first time, that the same idea which I had embodied in my motion was in the original treaty of arbitration, proposed at Brussels by Hon. Richard Bartholdt, president of the American group of the Interparliamentary Union.

Houses of Parliament.

"The Commission on Arbitration Treaty had omitted this idea from the draft of a treaty proposed by it for the adoption of the Conference, and in its place had proposed, not as a part of the treaty, but as a sort of postscript, a suggestion that, in all those questions reserved from the jurisdiction of the Hague Court for settlement on the field of battle, the disputant nations should call in friendly Powers, as mediators, before the commencement of hostilities. It seemed to me that the idea in this postscript, like the

idea in the postscript of many letters, was equally as important as the substance of the document itself.

"The chairman of the Commission on Arbitration Treaty suggested the union of my motion for an investigation into the facts and of the commission's motion for mediation, in every controversy, prior to the commencement of hostilities. This union of the two ideas improved both of them.

"The Executive Council of the Conference requested me to address the assembly in favor the motion thus amended. And I was rejoiced to see this motion approved unanimously by this assembly, which the British Premier so justly declared is 'entitled to express, with an authority attaching to no other assembly in the world, the conscience, the reason and the sentiments of a large and not the least influential portion of the human race.'

"The address of the Premier — Sir Henry Campbell-Bannerman—in opening this Conference, was not only memorable, but epoch-making. It contained several sentences any one of which, issuing from such a source into such an assembly, would have justified this great conference of the world's national lawmakers. The motion which I had made was in direct line with this suggestion made by the Premier:

"'Gentlemen, I fervently trust that before long the principle of arbitration may win such confidence as to justify its extension to a wider field of international differences. We have already seen how questions, arousing passion and excitement, have attained a solution, not by arbitration in the strict sense of the word, but by referring them to such a tribunal as that which reported on the North Sea incident, and I would ask you whether it may not be worth while carefully to consider, before the next Congress meets at The Hague, the various forms in which differences might be submitted, with a view to opening the door as wide as possible to every means which might in any degree contribute to moderate or compose such differences.'

"I was delighted to find that the idea which I had come to advocate was in line with what the Premier felt constrained to say in opening the Conference, and that Mr. Bartholdt had already proposed it at the Brussels session. I was happy to follow in his footsteps in advocating this plan for peace among these lawmakers from many nations. It seems to me that the adoption of this idea will open the path to peace. It solves the most difficult problem in regard to war and peace, because it handles those questions which thus far have defied arbitration — questions supposed to affect the vital interests or the honor of the Powers concerned, and which they are unwilling, therefore, to remove from the arena of violent settlement to the precincts of any court. This idea furnishes a solution, because it leaves the nations free to appeal to arms as a last resort, and because it delays the exercise of this right until an investigation has cleared up disputed questions of fact, until cooling time has elapsed, and until the public sentiment of the world can be marshaled, so that all the moral forces can be united for compelling a peaceful settlement of *every* question which threatens the peace of *particular* nations, and the prosperity and welfare of *all* nations.

"These are the three reasons which I gave for the adoption of this motion. If an investigation into the facts of every case can be had, prior to the commencement of hostilities, the chances are 100 to 1 that you can find a settlement of both the question of fact and the question of honor without resorting to war. For with nations, as with individuals, *disputed* questions of fact cause most of the controversies. Clearly bring out the actual facts and the controversy disappears as a rule.

"In the second place, man excited is very different from man calm. When men are mad they swagger around and say what they *can* do. When they are calm they consider what they *ought* to do. The investigation gives time for the claims of conscience and reason to assert themselves.

"The third advantage is also very great. The investigation affords an opportunity to mobilize public opinion for the compelling of a peaceful settlement. Public opinion is becoming more and more a controlling power. Thomas Jefferson once said that if he had to choose between newspapers with government and government without newspapers, he would rather risk the newspapers without a government. That may seem an extravagant statement. But it served to

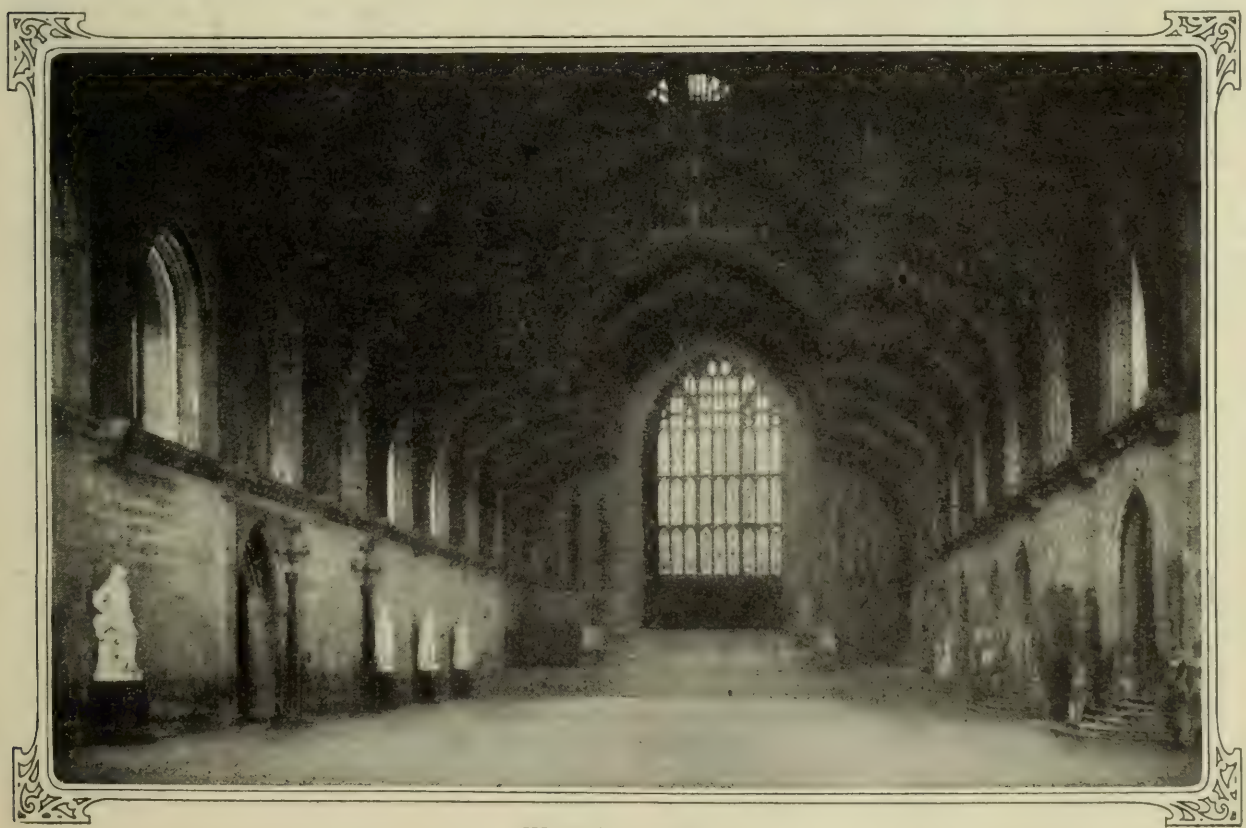
The Royal Gallery, Westminster, where the Interparliamentary Conference was held.

express and impress an idea—the idea that open avenues for the expression of opinion create a public opinion which is controlling, and which will be nearer right than an opinion formed by a government with freedom of speech suppressed.

Providing as it does for the free play of all the moral forces of the world, for separating the question of fact from the question of honor, and for the calming of passion and the rousing of conscience and reason, before the decision to take up arms is made, this resolution is entitled to the fullest consideration of the governments, in their desire to open the door as wide as possible for peaceful settlement of controversies, as a result of the coming Conference at The Hague.

"In laying so much stress upon this idea, I do not desire to underrate the others adopted by the Conference—*i. e.,* for establishing the International Conferences upon a firm foundation by making provision for their periodic assembling; for granting jurisdiction to the Hague Court to *try and finally* to determine specified classes of questions; for national consideration of the question of armaments, with a view to an international agreement to limit or reduce them, etc. This resolution supplements these others, and in the way most apt to decrease the danger of war to the very lowest possible point.

"I am much interested to learn that Mr. Bartholdt proposed this step on the path to peace to the Conference at Brussels, on the very day that President Roosevelt re-established peace in Asia. I wrote President Roosevelt an open letter, as soon as peace was concluded, suggesting that he avail himself of the prestige which this gave him, to propose this idea as a means of preventing the recurrence of such calamities. We were arriving at the same conclusions independently, and were availing ourselves of the avenues open to us, at the time, to give expression to these conclusions. Events brought us together at London to co-operate in securing the endorsement of this idea and of other important ideas which pertain to the world's peace. I was indeed happy to find that I could lend my influence to the adoption of ideas, for which the American delegation was already the sponsor, and which do open the way to permanent peace. I must express some of the high appreciation which I think is due from us all to



Mr. Bartholdt for his conspicuous service in this cause.

"In regard to the question of limiting armaments by an international agreement, this has seemed to me a question which primarily concerns Europe, so I have not given it due consideration. I will do so, however, at the earliest possible moment, in view of the resolution adopted at this Conference. Baron d'Estournelles was much pleased with an illustration which I suggested to him, and insisted on my making use of it in my address at the Westminster Hall *dejeuner*, tho I wanted him to do so.

"Suppose three men living near the same lake and a fourth man with a plant for building boats and for manufacturing arms conveniently near. This man says to A that his safety depends on having a boat well armed, for fear of an attack by B on C. Thereupon A gives an order for one boat well armed. He then goes to B and says A is building one boat, don't you think that you need two? Then he goes to C and says, A is building one boat, B is building two, does not your safety depend on placing an order for three better boats, better armed? And so the three men, who need to aid each other, burden themselves and increase their danger of destruction by squandering their resources on armed boats.

"This Conference has carried us far on the path toward permanent peace. It has proposed the taking of the longest steps that can be taken on that path. The ideas which will open the way as wide as possible now have able advocates at every capital of Europe. The governments could not be expected to adopt these ideas until the progressive statesmen of many countries declare for them. This has now occurred, and under circumstances of great historic interest. And the lovers of peace and justice have great cause for rejoicing. But, of course, permanent peace must be founded on justice, and justice is impossible without the full recognition of our relations and duties to others and the full performance of them. This depends upon a realization of the brotherhood of man, an appreciation of the value of life as life, the prevalence of love among the people of all countries.

"Permanent peace and justice depend upon the manifestation of love in all hearts, so that we would be horrified at the thought of the taking of life by the people of one country at war with the people of another, as we now are at this

Westminster Hall.

between members of the same family or community or state. The race is but a larger family. The world is awaking to this fact, and to the need of providing for peace and justice founded on this fact.

"By the resolutions of this Conference something has been done, perhaps a great deal has been done, to hasten the day when we shall all be appalled at the thought of war between any of the nations and when we shall all strive to raise every controversy to the level of a settlement by reason instead of force.

"God has not made strength depend upon violence. The world will not degenerate when it abandons armed conflicts and carries all its controversies to the courts of justice. Men become strong in standing steadfastly for what they think is right, in the midst of prevailing opinion to the contrary. This strength is the strength to be desired. And if my strength depended upon destroying my brethren I would rather not grow strong."

"Standing in the midst of this assembly of national lawmakers, in the Royal Gallery of Westminster Palace, hallowed by the memory of such men as Gladstone, who manifested so conspicuously the power that comes from struggling for the right and always in the realm of reason, with the paintings of Nelson's death at Trafalgar and of Wellington's victory at Waterloo looking down upon us, I was compelled, in speaking to the Conference, to contrast these scenes. I had to say that I understand how the dangers of war, bravely met, bring out great characteristics; that war gives opportunity for the display of patriotism; that the example of men who have given their lives for their country is an inspiring thing; but that there is as great inspiration in a noble life as in a heroic death. And I expressed the hope that this union of the world's lawmakers will aid in awaking mankind to the fact that a life lived for the public, overflowing like a spring with good, influences the destiny of the world as much as any death upon the field of battle. The sixty-four years of spotless public service of William Ewart Gladstone will some day be recognized as shedding upon England's history a light as great as that from any of her military heroes. And that life left no horrors to hang forever around the memory of the man. In the paintings which hung before us the glory and the horror of war were depicted. Lord Nelson was represented as dying, and around him were the mangled forms of others. Those whose strength comes in the moral struggle to establish permanent peace and righteousness, are no weaker than these heroes, and there is nothing in the remembrances of them which revolts the soul, only that which uplifts."

Before I advised Mr. Bryan that THE INDEPENDENT desired him to express his views for its columns, he had been speaking to me as secretary of the American delegation. What he said was not said for publication, therefore. But under the circumstances I feel justified in speaking of it, because it reveals character.

Mr. Bryan made his first speech in Europe three years ago. In it he spoke of the priceless political treasures which Americans have inherited, in common with Englishmen, and of what the English have added to this inheritance since we separated from them and what we in America have added to it. He declared our duty of proving ourselves worthy of this rich legacy, and then pointed out how our chief way of doing this was to widen the application of those principles of political liberty which we have inherited from the past, and particularly by their application in the relations between nations.

I recalled this speech to his mind, and then said that when he made it I felt that he had a large part to play in accomplishing this, and that the action of the Conference upon his motion had satisfied me of it; also that the events now transpiring in America made me believe he would be the next President, so that the time to do it was near at hand. Mr. Bryan replied:

"Mr. Davis, I am not sure that it is for me to be President. I have to antagonize established errors so constantly that I sometimes think a man should be at Washington, even in case of Democratic success, who has not been compelled to fight so incessantly. But, in addition to this, if I think of how my actions are going to affect my chances of election to office, or even the party's chances of suc-

cess, I lose my liberty. I don't know that the Presidency will ever be my proper place. I do know that the advocacy of what I consider right is always my proper place. So I have put the question of election to office out of mind, and claim for myself my liberty of advocating the ideas which I think right. If the Presidency comes on that basis, well and good. If not, I have fulfilled my function among my fellow men."

I replied that the Presidency would seek him till it found him, because he was acting on this principle. This, to my mind, answers the question which closes Mr. Willey's article in the July 19th issue of THE INDEPENDENT:

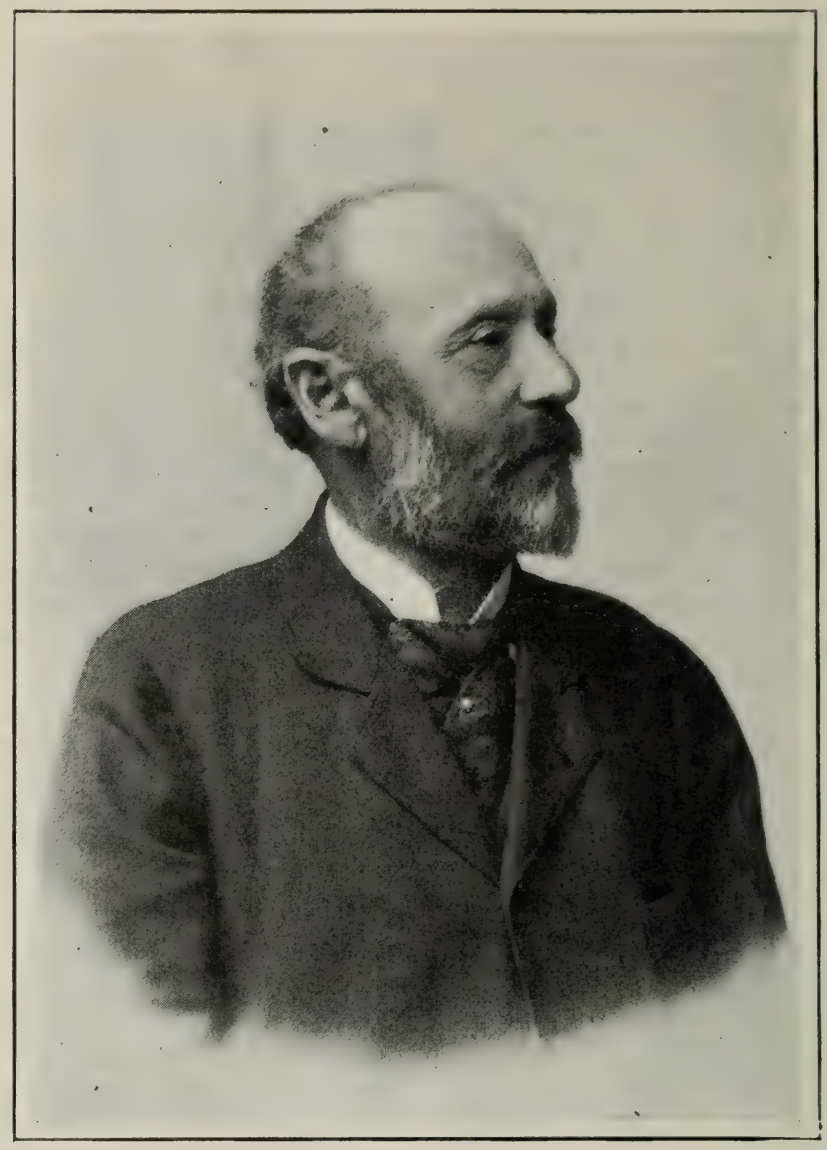
"When he [Bryan] left America he was practically ignored. His reception on his return promises to be one of the greatest which the American people have ever given a man in any station of life. Why?"

LONDON, ENGLAND.

When Will Turkey Cease to Exist?

BY ARMINIUS VAMBERY

[Professor Vambery is regarded as the best living authority on political affairs in the East.—EDITOR.]



HAVING been engaged for more than fifty years upon the theoretical and practical study of the East, I do not wonder at all that I am often asked to give my opinion on the question: When will Turkey cease to exist? In this connection, I might well point to the report of Count Choiseul to Louis XIV., made more than two hundred years ago, in which the French diplomatist alluded to the approaching end of the Ottoman power in Europe; and yet Turkey still exists! Many other similar vaticinations have proved unfounded; and this is not surprising when we remember that there are people who regard the vitality of Turkish rule in Europe as not at all hopeless, and who consider the above question to be quite out of place. On looking somewhat deeper into the matter, we shall find that both views are refuted by historical facts, and that while Turkey will surely cease to exist, the unavoidable end, however, is by no means so near at hand as some persons imagine.

Nobody doubts that the fabric called the Ottoman Empire is shaken to its very foundations and the tottering edifice held up mainly by two pillars, the strength and soundness of which do not depend exclusively upon the Turks themselves, but rather upon their fierce enemies, who, very naturally, are bent upon a steady weakening and final removal of these means of security. The first of these props is the rivalry of the foreign Powers and neighbors of Turkey in Europe and Asia, who, owing to the fat morsel which has kept their mouths watering for centuries, will hardly permit any one of them to become the heir of the deceased. If the different portions of the Sultan's dominions were not, as they really are, so highly valuable from an economical and political point of view, a fair partition of them might be among the possibilities. But, considering the greedy appetite of the competitors, such a solution of the difficulty is quite out of the question.

It is often assumed that England, having got possession of Egypt, Malta and Cyprus, will not care much about Constantinople, and that her rivalry with Russia on this point has ceased to exist. But this is quite a mistake. It is not Constantinople alone, but the mastery of the Mediterranean, which forms the bone of contention. England will hardly acquiesce in a Russian occupation of the Bosporus and the Dardanelles; still less will Italy, France and Austria-Hungary remain indifferent to the arrival of a new power in these waters.

As regards Turkey's land neighbors, it requires a large measure of *naïveté* to imagine that Austria-Hungary and Russia have renounced forever their old aspirations for ascendancy in the regions

bordering upon the Ottoman Empire. The friendly co-operation witnessed to-day in Macedonia is very edifying and praiseworthy as long as the allied Powers are entrusted with the police work and with the pacification of the disturbed districts. But an extraordinary change will and must take place as soon as the question of mine and thine comes to the fore, of the Empire. Altho these different nationalities are one in their hatred of the common enemy, they are quite at variance and at loggerheads when it comes to their own affairs. The detestation of Greeks for Slavs, and of both of these for Armenians, is undoubtedly more pronounced than that which the Christian subjects feel for their Moham-

Arminius Vambery.

when the pacificators of today will soon be found at each other's throats. The protection which Turkey has enjoyed from the rivalry of the Western Powers will not, in a word, so soon lose its efficacy.

The second pillar which holds up the tottering Ottoman state is the lack of unity and the national aspirations which characterize the various non-Turkish elements which make up the population

medan master. And this animosity between Greeks and Slavs is of very old standing, since it dates from the seventh century of our era, when the Bulgarians migrated into Moesia from the lower Volga and came into contact with Byzantium. Originally belonging to the Ural-Altaic race, and later becoming Slavicised, the Bulgarians have retained the warlike character of their ancestors, and consequently have always been in

trouble with their refined but sly neighbors. So long as both were chafing under the iron rule of the crescent, this enmity did not show itself too strongly. But it has grown more prominent in recent years, and the possibility of these two races now marching shoulder to shoulder against their old common foe is very slight. Furthermore, we must take into the account the jealousy that exists between Bulgarians and Servians, and between these two taken together and the Rutzo-Wlachs; so that, however effete the political and military power of the Sultan may be, his disunited and quarreling Christian subjects will always be an unequal match for his army.

So long, therefore, as Turkey finds support in these two pillars, it is idle to talk of her near end; nor is there good ground to assume that the great Powers of the West will apply forcible means to hasten the process of utter collapse. Time, and time alone, will bring about the best solution of the Eastern Question, which has always given Europe so much trouble.

From the moment the Turks lost Bude, in 1682, began the process of crumbling off in small pieces, which, with momentary interruptions, has continued ever since. This process will evidently go on also during the near future. During the nineteenth century, Greece, Rumania, Servia and Bulgaria have fallen away from the Empire. The twentieth century will begin with the breaking off of Macedonia, to be followed by that of the district of Adrianople. But as regards Constantinople, this most coveted and more precious heirloom, it is destined to play the same part in Turkish rule in Europe that it played in the history of the Byzantine Empire, with this difference—that it would be premature to try and foretell at present when this change of masters will come about.

Many years ago my distinguished friend, Mr. Stead, proposed that the occupancy of the Bosporus be entrusted to the United States, he holding that this was the only Power that could fill this *rôle* without offending the susceptibilities of the European rivals. But, at least for the present, all speculations concerning the successor of the Turk at Constantinople are vain and illusory. The crescent on the top of the Aya Sofia will not be so easily supplanted by the double or single cross, as the enemies of the Turk imagine; for the Western Powers act very wisely in preventing any violent measure to this end and in avoiding all kinds of convulsions and useless bloodshed, which would surely result from any forcible solution of the naturally progressing process of decomposition.

The death struggle of the Sick Man may have become proverbial, his recovery may be looked upon as hopeless, but his demise can be hastened only by one important incident, viz., the steady deterioration of his financial condition, the disease from which he is suffering the most. With the increasing poverty of the Turkish nation and with the dire emptiness of the Turkish exchequer, it is impossible to rule over divers and inimical populations, and with Turkey's absolute lack of credit in Europe, it is inconceivable how the present from-hand-to-mouth policy can go on for any great length of time. The machinery of state must sooner or later come to a standstill; the unpaid, unclad and hungry soldiers will not and cannot continue to fight for a government which so utterly neglects them; and the office-holders, whose salaries are six or eight months in arrear, are already neglecting their service. It is, therefore, not the secret or open machinations of foreign Powers, not the schemings of the anti-Turkish elements of the nation, but financial misery which will bring about the eventual collapse of Ottoman rule and force the Western Powers to intervene and restore order.

It is not an easy thing to predict when this moment of disintegration will arrive, and this prediction is rendered all the more difficult by the appearance of a new factor on the stage of Near East politics; a factor whose interest it is to protract the agony of the Sick Man and to utilize this respite for the consolidation of its own economic position. Thus Germany will certainly use every means at her disposal to save her friend and ally, but there is much reason to doubt whether her efforts in this direction will be crowned with success. If the present ruler of Turkey, a very shrewd and gifted prince, had not made the mistake to alienate his own Mohammedan subjects

by his indescribable tyranny and despotism, and thus to make the whole country his bitter enemy, he might have hoped for final recovery under the devoted care of his Teutonic guardian. But the Sultan Abdul Hamid has destroyed all hope in this direction. His unbridled autocracy has extinguished every spark of national self-reliance in his people, and after his death the critical moment of the Ottoman Empire can hardly be longer staved off. Reshud Efendi, his presumptive heir and brother, is certainly his inferior in mental qualities, and consequently less capable to stand at the helm under the pressure of the accumulated difficulties, and if there is a slight hope for the better in the accession of his nephew Izzeddin, a son of the late Sultan Abdul-Aziz, nobody can tell whether this prince will be in a position to validate his right to the throne. The future of Turkey is, therefore, very dark as regards the successor of the present ruler.
